KEY TO PRONUNCIATION

For a full explanation of the various sounds indicated, see the KEY TO PRONUNCIATION in Vol. I.

ā as in ale, fate	ch as in chair, cheese
ā " " senate, chaotic	d " " Spanish Almodovar, pulgada, where it is nearly like <i>th</i> in English then
â " " glare, care, and as <i>e</i> in there	g " " go, get
ă " " ain, at	g " " German Landtag = <i>ch</i> in Ger ach, etc.
â " " aim, father	h " <i>j</i> in Spanish Jijona, <i>g</i> in Spanish gila, like English <i>h</i> in hue, but stronger
a " " ant, and final <i>a</i> in America, armada, etc	hw " <i>wh</i> in which
α " " final, regal, pleasant	k " <i>ch</i> in German ich, Albrecht = <i>g</i> in German Arensburg, Mecklenburg, etc.
a " " all, fall	n " in sinker, longer
ē " " eve	ng " " sing, long
ē " " elate, evade	n " " French bon, Bourbon, and <i>m</i> in the French Étampes, here it indicates nasalizing of the preceding vowel.
ē " " end, pet	sh " " shine, shut
ē " " fern, her, and as <i>z</i> in sir, etc	th " " thrust, thin.
e " " agency, judgment.	th " " then, this
i " " ice, quiet	zh " <i>z</i> in azure, and <i>s</i> in pleasure.
ī " " quiescent	
ī " " ill, fit	
ō " " old, sober	
ō " " obey, sobriety	
ō " " orl, nor	
ō " " odd, forest, not.	
o " " atom, carol.	
oi " " oil, boil	
ōō " " food, fool, and as <i>u</i> in rude, rule	
ou " " house, mouse	
ū " " use, mule	
ū " " unite	
ū " " cut, but	
ū " " full, put, or as <i>oo</i> in foot, book	
ū " " urn, burn.	
y " " yet, yield	
β " " Spanish Habana, Córdoba, where it is like English <i>v</i> but made with the lips alone.	

An apostrophe ['] is sometimes used as in tā'b'l (table), kǎz'm (chasm), to indicate the elision of a vowel or its reduction to a mere murmur.

For foreign sounds, the nearest English equivalent is generally used. In any case where a special symbol, as α, η, κ, n, is used, those unfamiliar with the foreign sound indicated may substitute the English sound ordinarily indicated by the letter. For a full description of all such sounds, see the article on PRONUNCIATION.

A PARTIAL LIST OF THE LEADING ARTICLES IN VOLUME IX

- FORAMINIFERA
Mr C William Beebe
- FOREIGN MONEY, VALUE OF
Professor Alvin Saunders Johnson.
- FOREKNOWLEDGE AND FOREORDINATION
Professor Irving F Wood
- FOREST LAWS, IN ENGLAND.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

FORAMINIFERA (Neo-Lat. nom. pl., from Lat. *foramen*, hole + *ferre*, to bear) A name given by the French zoologist D'Orbigny, in 1826, to a group of minute animals, which at that time were regarded as mollusks, because of their remarkable and beautiful shells. They were even ranked with the cephalopods because many of them possess shells spirally coiled, like that of the nautilus. In 1835, however, Dujardin recognized their true nature, and since his day the Foraminifera have been considered a subdivision of the Protozoa. They are now ranked as an order of Rhizopoda (qv), distinguished from the amoeba and its near allies by the form of the pseudopodia, which are very extensile and threadlike, and are constantly anastomosing so that they form a beautiful network of granular protoplasm. Another feature which serves to distinguish the Foraminifera is the presence of a shell, although not all rhizopods which have shells are of this order. The shell or "test" of the Foraminifera may be chitinous, or calcareous, or arenaceous (i.e., made up of particles of sand, mud, sponge spicules, or other foreign material firmly glued together), but it is never siliceous. The shells are distinguished as "perforate" or "imperforate," according as they have their walls penetrated, or not, by minute openings or canals through which the pseudopodia project. In nearly all cases there is a large opening through which the animal within the shell comes in contact with the surrounding water, and often there are two or more of these "general apertures." In the imperforate forms the pseudopodia are extended only through these general apertures. The Foraminifera with chitinous shells are all *Imperforata*, those with arenaceous shells are usually *Imperforata*, but there are many perforate forms, those with calcareous shells show two very distinct sorts of tests—one group having them white, opaque, like porcelain, and imperforate, while the other has them transparent, glassy, and perforate. Marking or sculpturing of the surface of the shell is very common in both groups. In regard to the form of the shell we find a most extraordinary variety, but the most important point is whether they are monothalamous (unilocular), i.e., composed of a single chamber, or polythalamous (plurilocular), i.e., made up of several or many chambers. The latter forms

arise by budding, from a single chamber, the buds remaining attached to the parent. Now, since the monothalamous shells may be spherical, ovate, spindle-shaped, star-shaped, or tubular (straight, curved, or coiled) and symmetrical or quite asymmetrical, it follows that the polythalamous shells may be very complex and irregular. They are often very beautiful and sometimes reach a considerable size. The great majority of the foraminifera are known by their shells alone, comparatively little being known of the animals themselves. In those which are known the contractile vacuole is wanting, and even the nucleus is usually indistinguishable, so that their structure would seem to be extremely simple.

In regard to their physiology we know that food is taken into the body in the form of minute organic particles, by means of the flowing or streaming movements of the protoplasm which makes up the pseudopodia. In addition to this food it is possible that some organic matter in solution in the water is also absorbed and used, for the ability to take carbonate of lime in solution and make use of it to form their shells is one of the most characteristic and obvious features of these animals. Their methods of reproduction are only partially understood. The processes of fission and of budding are constantly going on. In certain forms reproduction takes place by the formation of sporelike young. These exceedingly minute germs move about by a single flagellum. Such a flagellum-bearing embryo is called a "flagellula." The Foraminifera are chiefly marine animals, but those with chitinous shells are found mostly in fresh water. They are all very small, practically microscopic, though the white shells of many of the marine forms are large enough to be seen with the naked eye, quite a number are from 1 to 2 millimeters in diameter, and the well-known genus *Orbitolites* has a polythalamous shell, sometimes 20 millimeters across, while *Nummulitis* is an inch in diameter.

The shells of Foraminifera are found all over the ocean floor except in the Arctic regions, and in many places form deposits of great extent and thickness. It was formerly supposed that the animals lived swimming about in the sea, and that it was only at death that the shells sank to the bottom, but it is now known that comparatively few species are pelagic, and it is probable that most species live on the bottom throughout life. Geologically the Foraminifera occur from

Cambrian times down to the present, though they have been most abundant apparently since the close of the Paleozoic era.

The classification of the Foraminifera is a matter of unusual difficulty, owing to the very great individual variation that occurs in the form and appearance of the shell. It is very doubtful whether the "species" of this order are comparable with the species of higher groups, since little is known in regard to their reproduction and limits of variation. Ten families are now generally recognized, the lines of division being based on the composition of the shell, whether polythalamous or not, whether perforate or not, and on the relative arrangement of the chambers. The best-known families are the Globulidae, which includes the fresh-water forms, of which *Gromma* and *Microgromma* are familiar examples, the Miliolidae, including the huge *Orbitolites*, the Globigerinidae, with the widespread *Globigerina*, and the Nummulinidae, including the well-known and characteristic fossil forms *Fusulina* and *Nummulites*.

Fossil Foraminifera. The oldest-known Foraminifera appear in the Lower Cambrian rocks of the Province of New Brunswick, Canada, where occur some minute spherical shells that cannot be distinguished in respect of either size, form, or microscopic structure from the modern species *Orbulina universa*. Associated with these are species of *Globigerina*, very like those of modern times. Many Foraminifera are scattered through the overlying formations up to the Carboniferous system, where they suddenly appear in great abundance. Whole beds of limestone in Europe, Asia, Japan, and North America are formed by the closely crowded shells of the genera *Saccamina*, *Endothyra*, *Fusulina*, and *Schwagerina*. The two latter genera are not found above the Permian. Other extinct genera in the Carboniferous rocks are associated with species of genera that are still living in the Atlantic Ocean and the Mediterranean Sea. The Mesozoic rocks have also their Foraminifera in abundance. The genera of the family Lagenidae are predominant in the Liassic and Jurassic systems. The chalk deposits of the Cretaceous age of Europe and America consist largely of foraminiferan shells (especially *Globigerina* and *Rotalia*), together with spicules of sponges. The members of the order reached their greatest development in Tertiary time, though most of the genera and species found in the rocks of that period are still living in the modern seas. The majority of these were more abundant in the earlier period than they are now. Certain other forms, like *Orbitoides* allied to *Nummulites*, are restricted to rocks of Tertiary age. *Nummulites* (qv) is an important index fossil of the Eocene series, in which its coin-shaped shells constitute great limestone beds in the Alps and Egypt.

The well-known *Eozoon* (qv), found in Laurentian limestones in Canada, has long been considered by some authors to be the oldest foraminifer, and likewise the oldest-known fossil organism. Careful investigation has proved it to be a mineral concretion.

Bibliography. Calkins, *The Protozoa* (New York, 1901), Flint, *Recent Foraminifera* (Smithsonian Institution, Washington, 1889), Butschli, "The Protozoa," in Bronn's *Klassen und Ordnungen des Tierreichs*, vol. 1 (Leipzig, 1897), Zittel and Eastman, *Text-Book of Paleontology*, vol. 1 (New York, 1900), Chapman,

The Foraminifera. An Introduction to the Study of the Protozoa (London, 1902), Brady, "Report on the Foraminifera," in *Report on the Scientific Results of the Challenger Expedition, Zoology*, vol. xi (ib., 1884), Parker and Jones, "Nomenclature of the Foraminifera," in *Annals and Magazine of Natural History* (ib., 1858-75), Sherborn, "Index to the Genera and Species of the Foraminifera," *Smithsonian Miscellaneous Collections*, vol. xxxvii (Washington, 1893-95), Lister, "The Foraminifera," in Lankester's *Treatise on Zoology* (London, 1903), Cushman, *Monograph of the Foraminifera of the North Pacific Ocean* (Washington, 1910), Minchin, *Introduction to the Study of the Protozoa* (New York, 1912), Bagg, *Pliocene and Pleistocene Foraminifera from Southern California* (United States Geological Survey, Washington, 1912). See also PROTOZOA, RADIOLARIA, RHIZOPODA, and articles on the generic names mentioned in the text.

FORBACH, fôr'bag. A town in Lorraine, Germany, at the foot of the Schlossberg, on an affluent of the Rossel, 5½ miles southwest of Saarbrücken (Map Germany, B 4). Much truck farming is carried on. Glass, soap, and pasteboard are its manufactures. The place is mentioned as early as the tenth century under the name of Fuirpac. After the battle of Spichern, fought on the neighboring heights, Aug. 6, 1870, the town was occupied by the victorious German troops. Pop., 1900, 8209, 1910, 10,107.

FORBES, fôr'bz, ALEXANDER PENROSE (1817-75). Bishop in the Episcopal church of Scotland. He was born in Edinburgh and studied at the Edinburgh Academy and under Rev. Thomas Dale, the poet, in Kent; he also attended the Glasgow University (1833) and won distinction as an Oriental scholar. In 1836 he obtained an appointment in the Indian civil service and left England for Madras. Returning to his native country in 1839, he obtained a Sanskrit scholarship in Brasenose College. At Oxford he became associated with Pusey, Newman, and Keble, leaders of the Oxford movement, and in 1844 was ordained deacon and priest in the Church of England and held a curacy. In 1846 he returned to Scotland for a while, but afterward became vicar of Leeds (1847). After the death of Bishop Moir he was called to the see of Brechin (1848). In 1860 he was prosecuted for heresy, because he inculcated the doctrine of the Real Presence, but he made a powerful defense and was acquitted with censure and admonition. His *Short Explanation of the Nicene Creed* (1853) and *Explanation of the Thirty-nine Articles* (1867-68), and various commentaries, reviews, etc., were highly esteemed. He edited the original lives of St. Ninian, St. Kentigern, and St. Columba in the *Historians of Scotland*, vols. v and vi (Edinburgh, 1875), also *The Kalendars of Scottish Saints* (1872). He died at Dundee, Scotland, Oct. 8, 1875. Consult Mackey, *Bishop Forbes. A Memoir* (London, 1888).

FORBES, ARCHIBALD (1838-1900). An English journalist. He was born in Morayshire, Scotland, in 1838. He studied at the University of Aberdeen, served for some years in the Royal Dragoons, and then became special correspondent for the London *Daily News*, in which capacity he accompanied the Prussian army during the Franco-German War, witnessed the close of the Commune, visited India during the famine of 1874, accompanied the Prince of Wales on his

tour through India (1875-76), and was in the Carlist War with Spain, the Servian War, and the Russo-Turkish War of 1877, etc. He lectured in Great Britain, the United States, and Australia. Among his many works are a military novel called *Draun from Life* (1870), *My Experiences in the Franco-German War* (1872), *Life of Chinese Gordon* (1884), *William I of Germany* (1888), *The Afghan Wars* (1892), *Tsar and Sultan* (1894), *Napoleon III* (1898), *Black Watch The Record of an Historic Regiment* (new ed., New York, 1910). He died March 30, 1900.

FORBES, DAVID (1828-76). A British geologist and chemist, brother of Edward Forbes. Born at Douglas, Isle of Man, he specialized in chemistry at the University of Edinburgh, when 19 years old became superintendent of mining and metallurgical works at Espedal, Norway, and 10 years later returned to England as a member of the firm of Evans and Askins, Birmingham, nickel smelters. In 1857-60 he traveled through Bolivia, Peru, and Chile in search of nickel and cobalt, later he explored the Cordilleras in South America and the South Sea Islands, and the year 1866 he spent in Europe and Africa. He was foreign secretary of the Iron and Steel Institute, whose reports he published from 1871 to 1876. He is author of 58 papers, published chiefly in the *Geological Magazine*, the *Quarterly Journal of the Geological Society*, and the *Journal of the Chemical Society*.

FORBES, DUNCAN, of Culloden (1685-1747). A Scottish judge and patriot, born Nov. 10, 1685, probably at the family seat near Inverness. He was educated at Inverness grammar school and after completing his studies at the universities of Edinburgh and Leyden became advocate at the Scottish bar in 1709. Through family influence he was soon appointed sheriff of Midlothian and rapidly acquired political power and a lucrative practice. In 1722 he became member of Parliament for Inverness, in 1725 was appointed Lord Advocate, and in 1737 reached the summit of his profession as Lord President of the Court of Session. His loyalty to the English crown had been conspicuous in the rebellion of 1715, and at the outbreak of 1745 he hastened north and by his presence and influence did much to counteract the uprising. For advocating and exercising humanity towards the rebels he was accused as a suspect by Lord Lovat, who attacked Culloden House, his residence, but Lovat was spiritedly beaten off by the President and his people. The rebellion spread, and Forbes fled for refuge to the Isle of Skye. After the battle of Culloden he returned and zealously discharged his duties until he died, Dec. 10, 1747. He was the author of some important theological works, and a *Treatise* on the dignities, etc., bestowed by English kings on their eldest sons. Consult Duff, *Memoir attached to the Culloden Papers* (London, 1815), Bannatyne, *Memoir attached to Works of Duncan Forbes of Culloden* (Edinburgh, 1816), and Burton, *Lives of Simon, Lord Lovat, and Duncan Forbes of Culloden* (London, 1847).

FORBES, EDWARD (1815-54). An English zoologist. He studied medicine and other sciences in Edinburgh and Paris and in 1841 became naturalist of the surveying ship *Beacon* during a voyage to Asia Minor. In 1843 he became professor of botany at King's College, London, in 1852 professor of natural history at the School of Mines and president of the Geo-

logical Society, in 1853 professor at Edinburgh. He was a brilliant and voluminous writer. Important among his works are *History of British Starfishes* (1841) and *History of British Mollusca* (with Hanley, 1853). Consult Wilson and Geikie, *Memoir of Edward Forbes* (Edinburgh, 1861).

FORBES, EDWIN (1839-95). An American animal and landscape painter and etcher. He was born in New York, studied under A. F. Tait, and began as an animal and landscape painter. During the Civil War he was special artist for *Frank Leslie's Magazine*, and the spirited etchings he did at this time were presented by General Sherman to the government. They are now preserved in the War Office at Washington because of their historic value. Afterward he painted landscape and cattle scenes, among which are "Orange County Pasture" (1879) and "Evening—Sheep Pasture" (1881). In 1877 he was made an honorary member of the London Etching Club.

FORBES, GEORGE (1849-) A British electrician, son of James David Forbes the physicist. He was educated at St Andrews and at Cambridge, became professor of natural philosophy at Anderson's College, Glasgow, and was electrical engineer for the power plant at Niagara Falls. Among his published works are *Lectures on Electricity* (1888), *Alternating and Interrupted Electric Currents* (1895), *Elektrische Wechselströme und unterbrochene Ströme* (1896), *History of Astronomy* (1909), *Puppets A Workaday Philosophy* (1911).

FORBES, GEORGE, EARL OF GRANARD (1685-1765). See GRANARD.

FORBES, HENRY OGG (1851-) A Scottish traveler, born at Drumblade. In 1878-83 he made extensive scientific travels through Sumatra, Java, Timor, and other islands of the East Indies. In 1885 and 1886 he explored British New Guinea. He was elected a fellow of the Zoological Society of London and of the Royal Geographical Society and served as director of the Free Public Museums of Liverpool from 1894 to 1911. In 1911-13 he prepared a report on the birds of the Guano Islands for the government of Peru. He published *A Naturalist's Wanderings in the Eastern Archipelago* (1885) and *Natural History of Sokotra* (1903).

FORBES, JAMES DAVID (1809-68). A Scottish physicist and geologist. He was educated at the University of Edinburgh with a view to the law, but his natural inclinations led him to the study of physics. At the age of 19 he was elected to membership in the Royal Society of Edinburgh and five years later succeeded Sir John Leslie as professor of natural philosophy in the university, although opposed by Sir David Brewster. His studies on thermal radiations resulted in the important discovery of the polarization of heat, for which the Royal Society of London awarded him the Rumford medal. While traveling in the Alps, Forbes collected a vast amount of information bearing on the origin and movement of glaciers, and his book, which appeared in 1843, was the most valuable contribution on glacial phenomena that had been published up to that time. His investigations were limited to the collection and arrangement of reliable data, but they were the means of overthrowing many crude conceptions and of directing future studies in the proper channels. Forbes received the degree of LL.D. from the University of Edinburgh and was elected to

membership in the Royal Society of London, the Geological Society, and many foreign scientific societies, including the Institute of France. He contributed a great number of scientific papers to the *Proceedings* of the Royal Society of Edinburgh. His more extended publications are *Travels through the Alps of Savoy and Other Parts of the Pennine Chain, with Observations on the Phenomena of Glaciers* (1843), *Norway, and Glaciers Visited in 1851* (1853), *A Tour of Mont Blanc and Monte Rosa* (1855).

FORBES, JOHN (1710-59). A Scottish soldier. For some time he was a physician in Scotland, but he entered the army, served in the War of the Austrian Succession, became a colonel in 1757, and served for a time as quartermaster-general under the Duke of Cumberland. In December, 1757, he was sent to America as adjutant general for service against the French and Indians, accompanied the Louisburg expedition early in 1758, and in the summer of that year led a force of 6000 to 7000 across Pennsylvania, and on November 25 took possession of Fort Duquesne, which had been evacuated by the French on the preceding day, and which he renamed Pittsburgh. In March, 1759, Forbes, who had been dangerously ill through the expedition, died in Philadelphia. Consult Parkman, *Montcalm and Wolfe* (Boston, 1884).

FORBES, SIR JOHN (1787-1861). A Scottish physician, born at Cuttlebrae, Banffshire. He studied at Aberdeen from 1805 to 1807 and from the latter year to 1816 acted as assistant surgeon in the navy. In 1817 he graduated in medicine at Edinburgh and practiced at Penzance and Chichester until 1840, when he removed to London. He was physician to the Queen and Prince Consort, and was knighted in 1853. He was a fellow of the College of Physicians and the Royal Society of London, and a member of numerous foreign societies. Jointly with Drs Tweedie and Conolly, he edited the *Cyclopædia of Practical Medicine* (4 vols, 1832-35). In 1836 he founded the *British and Foreign Medical Review*, which he carried on for 12 years. In 1831 he published the first edition of his translation of *Lænnec's Treatise on Auscultation* (5th ed, 1838). Among his other works are *Physician's Holiday* (1849), *Memoranda Made in Ireland* (1852), *Sightseeing in Germany and the Tyrol* (1856), *Nature and Art in the Cure of Diseases* (1857).

FORBES, JOHN COLIN (1846-). A Canadian portrait and landscape painter, born at Toronto. He was already proficient in his art before he went to London, where he studied at the Royal Academy, South Kensington Museum, and afterward on the Continent. He lived in New York City for several years, but in 1911 settled in London, England. Among his works are the "Mount of the Holy Cross," "The Foundering of the *Huberman*," "The Glacier of the Selkirk," and many portraits, including those of the Marquis of Duferin, Gladstone, Sir Charles Tupper, Sir John A. Macdonald, Sir Henry Campbell-Bannerman, King Edward VII, and Queen Alexandra (Canadian Houses of Parliament, Ottawa).

FORBES, JOHN MURRAY (1807-85). An American clergyman. He was born in New York and graduated at Columbia College in 1827 and at the General Theological Seminary in 1830. He was ordained to the Episcopal ministry in the same year and in 1834 became rector of St Luke's Church, New York, also acting

for a time as professor of pastoral theology in the seminary. In 1849 he became a Roman Catholic and after reordination was appointed pastor at St Ann's Church, New York. He acted as theologian for the Bishop of Charleston in the council at Baltimore (1852). In 1859 he returned to the Episcopal church and from 1869 to 1872 was dean of the General Theological Seminary.

FORBES, STANHOPE A (1857-). An Irish genre painter. He was born in Dublin, studied at Dulwich College, the Lambeth Art School, the Royal Academy, and under Bonnat in Paris, and in 1889 received a first-class medal at the Paris Exposition. After spending several years in Brittany, he took up his residence about 1884 in Cornwall, where he became the leader of the so-called Newlyn School of painters, who are distinguished by naturalism, broad brushwork, and sense of atmosphere. Forbes is especially noted for his interior effects, which show much cleverness in the treatment of light. His paintings usually treat of the simple life of the Cornish fishermen. Among the best known are "The Health of the Bride" (Tate Gallery), "The Village Philharmonic Society" (Birmingham), "Off to the Fishing Ground" (Liverpool), "Sir Peter Code" (Norwich), "Mignon" (Sydney), "The Lighthouse" (Manchester); "Forging the Anchor" (1882), "The Pier Head" (1910), "The Old Pier Steps" (1911), and a decorative painting of "The Fire of London," in the London Stock Exchange. Forbes was elected a correspondent of the French Institute in 1905, a Royal Academician in 1910, and received gold medals at Berlin, Munich, and Paris (1900). His wife, ELIZABETH ARMSTRONG FORBES, is also a distinguished painter and etcher. Consult monograph by Hind (London, 1911).

FORBES, STEPHEN ALFRED (1844-). An American entomologist, born at Silver Creek, Ill., and educated at Rush Medical College, the Illinois State Normal University (where he taught zoology in 1875-78), and Indiana University (Ph.D., 1884). As a youth, he had served in the Civil War. He became prominently identified with scientific interests in Illinois, as curator for five years of the Museum of the State Natural History Society, founder (1877) and director of the State Laboratory of Natural History, State entomologist (after 1882) and director of the Illinois Biological Station (after 1894), and, at the University of Illinois, professor of zoology (1884-1909), dean of the college of science (1888-1905) and professor of entomology (after 1909). He organized the International Congress of Zoologists at the Chicago Exposition in 1893, was president of the Western Society of Naturalists in 1890 and of the American Association of Economic Entomologists in 1893 and 1908, and prepared numerous entomological reports and studies.

FORBES, SIR WILLIAM, of Pitshgo (1739-1806). A Scottish banker and writer, born at Edinburgh and educated at Aberdeen. In 1761, after being seven years in their employ, he was admitted as a partner in the bank at Edinburgh of Messrs John Coutts & Co., and two years later a new company was formed, of which he became the head in 1773. In 1781 he purchased the estate of Pitshgo, Aberdeenshire, which had been forfeited by Lord Forbes of Pitshgo for his part in the rebellion of 1745. He introduced the most extensive improvements on it and laid

out and built the village of New Pitsligo. He was a member, with Johnson, Burke, Garrick, Reynolds, and others, of the celebrated Literary Club of London, was a friend of Dr Beattie the poet, and published *An Account of the Life and Writings of James Beattie* (2 vols, 1806). He also wrote *Memoirs of a Banking House* (1803). His bank became, in 1838, the Union Bank of Scotland.

FORBES, WILLIAM CAMERON (1870–) An American public official, born at Milton, Mass. Graduating from Harvard University in 1892, he was for a time a clerk in a Boston banking house, from 1897 to 1902 had charge of the financial department of the engineering firm of Stone and Webster, and after 1899 was a partner of J. M. Forbes & Co., bankers, Boston. In the government of the Philippine Islands he was a member of the Philippine Commission and secretary of commerce and police from 1904 to 1908, Vice Governor in 1908–09, and Governor-General from 1909 to 1913, when he was succeeded by Francis Burton Harrison (qv).

FORBES QUARRY See MAN, ANCIENT TYPES OF.

FORBES-ROBERTSON, SIR JOHNSTON (1853–) An English actor, born in London. He early won some success as a painter, but went upon the stage when he was 21 years old, and was thereafter a member of various companies, including those of Sir Henry Irving and Sir Squire Bancroft. In 1895 he appeared with Miss Patrick Campbell in the first production of *The Notorious Mrs. Ebbsmith*, playing the part of Lucas Cleve. The same year he made his first venture in London management, opening with *Roméo and Juliet*, in which he and Miss Campbell played the title rôles. Three years later he followed this with *Othello* and *Hamlet*, and scored the greatest success of his career in the latter. In 1898 he took his company to Berlin, where he appeared successfully in *The Second Mrs. Tanqueray*, *Macbeth*, and *Hamlet*. His first appearance in America was in 1885 as Orlando. He returned in 1906 and produced Shaw's *Cæsar and Cleopatra*, and again in 1909, when he appeared in *The Passing of the Third Floor Back*, which ran through the entire seasons of 1909–10 and 1910–11. In 1912 he began a farewell tour of the English provinces, appearing in a repertoire of his former successes. He extended this to include America, where he appeared with Gertrude Elliott, his wife, during the season of 1913–14. He was knighted at the termination of his farewell season at Drury Lane in 1913. He came to be regarded as one of the most distinguished actors of his time. Consult William Winter, *The Walley of Time* (2 vols, New York, 1913).

FORBIDDEN FRUIT A name fancifully given to the fruit of different species of the genus *Citrus*. In the shops of Great Britain, a small variety of the shaddock (*Citrus decumana*) generally receives this name, but on the continent of Europe a different fruit, regarded by some as a variety of the orange and by some as a distinct species (*Citrus limetta*), is known as the forbidden fruit, or Adam's apple. The name "forbidden fruit" has also been given to the fruit of *Tabernemontana dichotoma*, a tree of Ceylon, of the family Apocynaceæ. The shape of the fruit, which is a follicle, containing pulp, suggests the idea of a piece having been bitten off, and the legend runs that it was good be-

fore Eve ate of it, although it has been poisonous ever since. See POMELO, SHADDOCK, CITRUS.

FORBIGER, FÖR'BIG-ÉR, ALBERT (1708–1878) A German classical scholar, born in Leipzig. He studied at the University of Leipzig, in 1824 was appointed an instructor in the Nikolaischule in Leipzig, and in 1835 became its associate rector. From 1863 to his death he was at Dresden. His publications include an edition of *Vergil* (4th ed, 1872–75), *Handbuch der alten Geographie* (1842–43), a translation into German of Strabo (1856–62), *Hellas und Rom* (1871–82), with A. Winckler, *Consult Sandys, A History of Classical Scholarship*, vol. III (Cambridge, 1908).

FORBIN, FÖR'BÂN', CLAUDE, COUNT DE (1656–1733) A French mariner, born at Gardanne (Provence). After a wild boyhood he entered the navy and distinguished himself by reckless bravery in the campaigns of Messina (1675), the Antilles (1680), and Algeria (1682–83). He was sent to Siam as Ambassador in 1685 and so pleased the King of that country that he made him his grand admiral. In 1688 Forbin returned to France and under Jean Bart fought against England and was taken prisoner. From 1690 to 1707 Forbin was very active. He fought at La Hogue and Lagos and at the taking of Barcelona and captured numerous English and Dutch vessels as commander of the French fleet in 1706–08. In 1708 he commanded the expedition to conduct the Pretender to Scotland, but failed, as the coast was too well guarded. In 1710 he retired from active life and lived at Marseilles, where he wrote his entertaining *Mémoires*, which were edited by Reboulet and first published in 1729. Consult the biography by Richer, 4th ed. (Paris, 1816).

FORBONNAIS, FÖR'BÔ-NÄ', FRANÇOIS VÉRON DUVERGER DE (1722–1800) A French political economist, born at Le Mans (Sarthe). After study of business methods at Nantes, and travel in Italy and Spain, he became inspector general of the Mint in 1756, and in 1759 the head of the office of Silhouette, Comptroller General of the Finances. In 1763 he was forced to retire. His advice was frequently sought by the Constituent Assembly of 1790, in the reform of the monetary system. He was elected a member of the Institute of France in 1794. He wrote extensively on economic questions, contributing to the *Encyclopédie* the article "Commerce" and opposing the physiocrats, especially Quesnay. He possessed judgment of a high order and clear style, and his works influenced the administration of his day and are still valuable. These include *Éléments du commerce* (2 vols, 1754), *Recherches et considérations sur les finances de France depuis 1555 jusqu'en 1721* (1753), *Principes et observations économiques* (1767), *Analyse des principes sur la circulation des denrées* (1800). Consult Delisle de Sales, *Vie littéraire de Forbonnais* (Paris, 1801).

FORCADOS, FÖR-KA'DÔS A town and port of call on the delta of the river Niger in south Nigeria. It is built on land which has been reclaimed from the river and is the centre of a large project for reclamation and sanitation. Pop., about 3000.

FORCE (Fr. *force*, OSp. *It forza*, from ML. *fortia*, force, from Lat. *fortis*, strong, connected with Skt. *brhan*, high). If the motion of a body is observed to be changing, i.e., if it is observed to have an acceleration (qv), it is said to be

under the "action of a force." As illustrations, changes in motion are observed if a heavy body is allowed to drop from the hand, if a piece of iron is brought near a magnet, if a piece of paper or dust is brought near an electrified body, etc., and therefore one speaks of the "force of gravitation," "magnetic force," "electric force," etc. In every case, however, when there is a change in the motion of a body, it may be shown that this change is in some way due to the presence of some other body, e.g., the earth, the magnet, the charged body, and it is shown in mechanics (qv) that the proper measure of this influence on the body which receives the acceleration is the product of the numerical value of its mass and the numerical value of the acceleration received. Thus, if a body whose mass is m grams is moving with an acceleration a (measured in centimetres and seconds), an "external force" of ma dynes is said to be "acting on it," since in the C G S system the dyne is the unit of force. This acceleration may, of course, be due to the simultaneous "action" of several forces, each of which by itself would have produced a different acceleration. In particular, if there is no acceleration, this does not necessarily mean an absence of external action, but may mean that there are two forces acting in opposite directions which are numerically equal. There are two general methods for measuring forces: one is to measure the mass and the acceleration, the other is to balance the force by one whose value is known. Thus, as all bodies fall towards the earth at any one place on the earth with the same acceleration when allowed to fall freely, viz., with an acceleration which may be called g and which nearly equals 980, the force of the earth on a body, whose mass is m grams, i.e., its "weight," is mg . Consequently, if this body is kept from falling by being suspended by a cord, the cord must exert on the body an upward force whose numerical value is mg . If, therefore, it is required to apply a force F in a particular direction, it is simply necessary to attach a body whose mass m equals F/g to one end of a cord, pass the cord over a pulley (qv), and attach its other end to the body on which the force F is to act, in such a manner that the cord pulls in the specific direction. Similarly, if any force can be neutralized by the weight of a body of mass m , this force must have the numerical value mg dynes. In this way "magnetic" or "electric" forces can be measured.

The "field of force" of a body is the region through which it is possible to detect the action of forces on other bodies due to its presence. Thus, the field of force of gravitation of the earth extends far beyond the moon out into celestial space, the field of magnetic force of the earth also extends far out into space—how far, it is not known, the field of electric force due to a charged body is in general a limited region quite near it. The "direction of the field" at any point is that in which a specific particle of matter placed at that point would move under the action of the given kind of force if allowed to move freely. Thus, the direction of the field of gravitational force around the earth is always vertically towards the centre of the earth, the direction of a magnetic field of force is that in which the north pole of a minute magnet would move, the direction of an electric field of force is that in which a particle of matter positively charged would move. The subject of force plays an important part in all conditions involving

physical measurements. The student of physics is referred to one of the modern treatises on physics. Consult Everett, *Centimetre-Gramme-Second System* (London, 1902), Hertz, *Principles of Mechanics* (ib., 1899), F. Soddy, *Matter and Energy* (ib., 1912), J. Weir, *Energy System of Matter* (ib., 1912), W. Ostwald, *Die Energie* (2d ed., Leipzig, 1912), A. H. Gibson, *Natural Sources of Energy* (New York, 1913).

FORCE, LA See **LA FORCE**

FORCE, MANNING FERGUSON (1824-99). An American soldier, writer, and lawyer, the son of Peter Force (qv). He was born in Washington, D. C., and graduated at Harvard College in 1845 and at the Harvard Law School in 1848. On the outbreak of the Civil War he entered the Federal army as major of the Twentieth Ohio Volunteers, at the close of the war was brevetted major general of volunteers. Refusing a colonelcy in the regular army, he resigned from the service, practiced law, and was judge of the Court of Common Pleas of Hamilton Co., Ohio (1867-77), judge of the Superior Court of Cincinnati (1877-87), and commandant for many years of the Ohio Soldiers' Home. He published *Prehistoric Man* (1873), *To What Race did the Moundbuilders Belong?* (1879), *From Fort Henry to Corinth* (1881), *Marching across Carolina* (1883), *Personal Recollections of the Vicksburg Campaign* (1885), *Life of Justice John McLean* (1885), a biography of Gen. W. T. Sherman (1899). He edited Walker's *Introduction to American Law* (1878) and Harris's *Principles of Criminal Law* (1880).

FORCE, PETER (1790-1868). An American scholar and historian, born near Passaic Falls, N. J. He became a printer, served in the War of 1812, went to Washington in 1815, and in 1820-36 published the *National Calendar*, a statistical annual. From 1823 to 1830 he was proprietor and editor of the *National Journal*, a semiweekly which became a daily in 1824. He was mayor of the city of Washington in 1836-40 and in the latter year was elected the first president of the National Institute for the Promotion of Science. In 1836-46 he published *Tracts and Other Papers Relating principally to the Origin, Settlement, and Progress of the Colonies in North America, from the Discovery of the Country to the Year 1776* (4 vols.). But he is best known for his *American Archives*, a documentary history of the English colonies in North America, edited by him and Matthew St. Clair Clarke, and published at the expense of the government under an Act of Congress of 1833. Nine volumes, covering the period from 1765 to 1776, appeared in 1837-53, but the work was then discontinued because Marcy, Secretary of State, refused to approve further volumes. Force's unique library, including 30,000 pamphlets and more than 20,000 volumes and consisting principally of Americana, of which he was the earliest important collector, was purchased by the government in 1867 for \$100,000 and incorporated with the Library of Congress. Force was also an authority on the literature of Arctic discovery and wrote *Grinnell Land* (1852).

FORCE BILL. In American political history, the name applied to several bills passed by the United States Congress. (See **NULLIFICATION**, **RECONSTRUCTION**, **KU-KLUX KLAN**.) The Force Bill of 1890 was introduced to the House by Representative Lodge, of Massachusetts. It provided that on petition of 500 voters in any

local district Federal officials of both parties be appointed on election boards. The bill was aimed at the Southern States, where the negro had been illegally excluded from the polls. It aroused a storm, and though it passed the House never came to a vote in the Senate.

FORCE DE CHEVAL, fôrs de she-val' (Fr., horse power). A French unit of power, also known as *cheval-vapeur*, equal to 736 watts (qv), and corresponding to the English "horse power," which is equivalent to 746 watts. It is the rate of work or activity equivalent to 75 kilogrammeters per second. See MECHANICAL UNITS.

FORCED MARRIAGE, THE. A tragic-comedy by Mrs. Aphie Behn, produced at the Duke's Theatre in 1671.

FORCELLINI, fôr-chêl-lê-nê, EGIDIO (1688-1768). An Italian philologist. He was born in a village near Padua. Owing to the limited means of his family, Forcellini was deprived of early instruction and was already verging towards manhood when enabled to commence a regular course of study in the seminary at Padua. His ability and industry won the admiration of the principal, Giacomo Facciolati (qv), who associated him with some of his own scientific labors. Forcellini's main life-work was the compilation of a highly important lexicon (For the correct account of the preparation of this work, one of the most valuable acquisitions to philological science of the age, see FACCIOLATI). In addition to the Italian and Greek signification of the Latin word, the literal and figurative application of each expression is given in a collection of examples, embracing the customs, laws, arts, sciences, religion, and history of the Romans.

FORCEPS (Lat., pincers). An instrument of great antiquity, used as a substitute for the fingers, and consisting of two levers of metal jointed together crosswise, usually nearer to one end than the other. The hand grasping the longer ends of the levers, or handles, closes the shorter ends, which are shaped so as to seize firmly the intended object. There is scarcely a surgical operation in which it is not applied. The variety is almost innumerable. In addition to the forms used in dentistry there are in common use the *dissecting* forceps, which has roughened points, to lay hold of small portions of tissue which are to be divided by the knife, the *lithotomy* forceps, which has blades concave like spoons, while other forms of this forceps are adapted for seizing stones of various shapes and sizes, and *artery* forceps, with locks for seizing and holding the extremities of bleeding vessels. By means of Liston's *cutting* forceps, a powerful hand can divide a great thickness of bone. One of the most important of all forceps is the *obstetric* forceps, an invaluable invention in cases of difficult delivery. It consists of two concave fenestrated blades, forming a cavity into which the head of the child fits. The blades are applied separately, one to each side of the head, and then locked together. Holding by the handles, the accoucheur aids the natural efforts of labor. The instrument does not necessarily or generally injure either mother or child.

FORCHHAMMER, fôr-ç'hâm-mêr, JOHANN GEORG (1794-1865). A Danish geologist. He was born in Husum, Schleswig, studied at Kiel and Copenhagen, and was associated with Oersted and Esmarch in a mineralogical exploration of Bornholm. In 1823 he became lecturer on

chemistry and mineralogy in Copenhagen University, in 1831 professor of mineralogy, and in 1848 curator of the geological museum. He succeeded Oersted in 1851 as director of the Polytechnic School and secretary of the Academy of Sciences. His researches (jointly with Steenstrup and Worsaae) on the prehistoric anthropology of the north of Europe have yielded results of great importance. Among his publications are *Krystallographie* (1833), *Danmarks geognostiske Forhold* (1835), *Bidrag til Skildringen af Danmarks geografiske Forhold* (1837).

FORCHHAMMER, PETER WILHELM (1801-94). A German classical archaeologist and mythologist, brother of Johann Georg Forchhammer. He was born at Husum, Schleswig, and studied at the University of Kiel, where he became professor extraordinary in 1836. In 1830-34 he visited Italy and Greece and in 1838-40 undertook a second journey to Greece, Asia Minor, Egypt, and Rome, which bore fruit in valuable contributions to the topography of ancient Hellas and the Greek settlements in Asia. Among these works were *Hellenika* (1837) and *Ueber die Reinheit der Baukunst* (1856), in which he traced the four styles of Greek architecture to climatic conditions and differences in materials. He also wrote treatises on the philosophy of Aristotle and on the archaeology and mythology of Greece. In his works on the latter subject he invariably regarded the Hellenic myths as personified embodiments of natural, and especially aquatic, phenomena, he held that the Greeks had converted the annually recurring processes of nature into acts of heroes and gods. Among these publications mention should be made of his *Achill* (1853), in which he explained the Trojan War as based ultimately on the conflict of the elements in the winter season in the Troad, *Daduchos* (1875), *Die Wanderungen der Inachostochter Io* (1881), *Erklärung der Ilios auf Grund der topischen und physischen Eigentümlichkeiten der troischen Ebene* (1884), *Prolegomena zur Mythologie als Wissenschaft und Lexikon der Mythensprache* (1891), *Homer Seine Sprache, die Kampfplätze seiner Heroen und Gotter in der Troas* (1893). His early work, *Die Athener und Sokrates* (1837), contained many original ideas that were at first ridiculed, but were afterward accepted by prominent historians. On topography he wrote also *Topographie von Athen* (1841) and *Beschreibung der Ebene von Troja* (1850). Forchhammer sat in the Prussian Diet from 1868 to 1870 and from 1871 to 1873 was a member of the German Reichstag. Consult Alberti, in *Bursian's Biographisches Jahrbuch für Altertumskunde*, vol. xx (Berlin, 1897).

FORCHHEIM, fôr-ç'hîm. A town in Upper Franconia, Bavaria, near the junction of the Wiesent with the Regnitz, on the Ludwigskanal, 16 miles south-southeast of Bamberg. It has a castle and the Gothic Collegiate Church, with paintings by Michael Wohlgemut and sculpture by Veit Stasz. Its manufactured products include machinery, cloth, textiles, optical and leather goods, tin foil, water and oil colors, fertilizer, glue, beer, and paper. Forchheim was an important town in the days of Charlemagne and in the ninth and tenth centuries was the meeting place of many royal diets. From 1007 to 1802 it was held by the bishops of Bamberg, except during an interval of about 30 years. In its vicinity the French, on Aug. 7, 1796, gained

a victory over the Austrians Pop, 1910, 9150

FORCIBLE ENTRY AND DETAINER.

The taking and keeping possession of real property through threats or force, without authority of law. To make an entry forcible and, as such, unlawful, there must be such acts of violence or menaces as may give reason to anticipate personal injury or danger in making a defense. But the force must be more than is implied in mere trespass. There are in most of the States statutes regulating proceedings in cases of forcible entry, directing the manner of proceeding for the restoration of property unlawfully withheld and the punishment of the offender. The plea of ownership is not a justification for the use of force in recovering property, for no one may enter even upon his own property in any other than a peaceable manner. Nor can the owner be excused on the plea that he entered to enforce a lawful claim or make a distress. The policy of this legislation is to prevent the disturbance of the public peace and to compel disputants to settle their controversies in a court of justice.

Originally by the common law of England the right of entry upon land of which one had been unlawfully deprived might be exercised by force if necessary. But by a series of early statutes, the first of which dates back to the time of Richard II (5 Rich II, c 7, 1381), this remedy was limited to an entry in peaceable and easy manner, and not with force or strong hand. See ENTRY, RIGHT OF.

FORCING, IN HORTICULTURE The acceleration of vegetation by application of artificial heat. The term is not usually applied to the cultivation of exotic plants in hothouses, where the object is to imitate as much as possible their native climate, but it is strictly applicable to the system usually pursued with various flowers, grapes, pineapples, tomatoes, and other plants, to secure the production of bloom and fruit at desired seasons, and by different plants of the same kind in succession through a considerable period, the heat being increased for one set of plants sooner than for another. Many of the fruits and vegetables which grow well in the open air are very commonly forced, in order that they may be procured out of their natural season. Thus, rhubarb is forced by means of the heat produced by heaps of fermenting manure. Asparagus, salads, radishes, lettuce, onions, etc., are often forced by means of hotbeds, or in flued pits, or a place is found for them in hothouses. Strawberries are treated in the same way. See HOTBED, HOTHOUSE.

FOR/CITE See EXPLOSIVES

FORCKENBECK, fôr'k'en-bêk, MAX VON (1821-92). A German Liberal politician, born at Munster, Westphalia. In 1858 he was elected to the Prussian House of Representatives, in 1862 he founded the Fortschrittspartei, or Party of Progress, and in 1866 the National Liberal party. He was elected president of the House in 1866. From 1867 until his death, except for the years 1887-90, he was a member of the Reichstag, and from 1874 to 1879 its president. He sat in the Prussian House of Peers from 1873, as chief burgomaster of Breslau, and from 1878 until his death he was chief burgomaster of Berlin, but he took little part in politics after the downfall of the National Liberal party. In 1877 Bennigsen refused Bismarck's offer of a portfolio because he would not give a portfolio

to Forckenbeck. The latter broke with Bennigsen in 1880 and with Bamberger and Stauffenberg formed the Liberal Union (Liberal Vereinigung). In 1884 he joined the Deutschfreisinnige party. Consult the biography by Philippson (Dresden, 1898).

FORD, EDWARD ONSLOW (1852-1901). An English sculptor. He was born in London and studied painting at the Antwerp Academy and sculpture at the Munich Academy under Wagnmüller. He became an associate of the Royal Academy in 1888 and a Royal Academician in 1895. He was also elected a corresponding member of the Institute of France. He is best known for his portrait statues and busts which are delicately modeled and truthful likenesses. Among the best of his busts are those of Herkomer, Millais (National Portrait Gallery, London), Alma-Tadema, Dagnan-Bouveret, Briton Rivière, and Sir Frederick Bramwell (Royal Institution, London). His best statues include those of Sir Rowland Hill (1882), at the Royal Exchange, Gladstone (1894), at the city Liberal Club, London, Sir Henry Irving as Hamlet (1883, Guildhall Art Gallery, London), C G Gordon ("Chinese" Gordon) (1890), at Chatham and Khartum, the Marlowe Memorial at Canterbury, the Shelley Memorial at University College, Oxford, a statue of Huxley (1900), at the British Museum of Natural History, the equestrian statues of Lord Strathnairn at Knightsbridge, the Maharajah of Mysore (1898), and the colossal statue of Queen Victoria at Manchester (1901). He also modeled many dainty nude statuettes, such as "Folly" and "The Singer," in the Tate Gallery, "Peace" (1890), "Echo" (1895), "Glory to the Dead" (1901). Ford possessed a strong feeling for the beautiful and the picturesque, his treatment is realistic, but the sculptural effect of some of his finest works is marred by excess of decorative detail. Consult Spielmann, *British Sculpture and Sculptors of To-Day* (London, 1901).

FORD, EMANUEL (fl. 1607). An Elizabethan romancer. He was the author of *Parismus*, in two parts (1598-99), long exceedingly popular, and of the similar romances, *Ornatus and Artesia* (1607) and *Montelion* (1633, but probably published earlier).

FORD, SIR FRANCIS CLARE (1828-99). An English diplomat, son of Richard Ford. He was commissioned a lieutenant in the Fourth Light Dragoons, but left the army in 1851, entered the diplomatic service, and became Secretary of Legation at Washington, where he was acting chargé d'affaires in 1867-68. In 1871 he was appointed Secretary of Embassy at St Petersburg and in 1872 was transferred to Vienna. He represented the British government in 1897 at Halifax before the International Commission, by decision of which \$5,500,000 was awarded to Great Britain for superior advantages obtained by the United States in the Washington fisheries treaty of 1871. In 1878-79 he was United States Minister to the Argentine Republic and during a portion of the time to Uruguay also. He was afterward appointed to similar posts at Rio de Janeiro and at Athens, in 1884 became Minister (from 1887 Ambassador) to Spain, in 1884-85 was commissioner to settle the Newfoundland fisheries question, in 1892 was transferred to Constantinople and in 1893 to Rome. His services to British diplomacy won for him frequent official recognition, including appointment to the Privy Council in 1888.

FORD, HENRY (1863–) An American automobile manufacturer. He was born at Greenfield, Mich., where he was educated in the district schools. He learned the machinist's trade and after 1887 lived in Detroit. For a time he was chief engineer of the Edison Illuminating Company. In 1903 he organized the Ford Motor Company, of which he became president. This corporation is the largest manufactory of automobiles in the world, it employs 16,000 men and has turned out about 1000 automobiles in a day, a specialty being made of low-priced cars. In January, 1914, Ford attracted national attention by his announcement of a profit-sharing plan involving the distribution of \$10,000,000 annually to his employees. See **PROFIT-SHARING**.

FORD, HENRY JONES (1851–1925) An American journalist and professor of politics. He was born at Baltimore, Md., and graduated from the Baltimore City College in 1868. He was editorial writer in 1872 and managing editor in 1875–79 of the *Baltimore American*, served for a time as city editor and in 1883–85 as staff member of the *Baltimore Sun*, held the managing editorship of the *Pittsburgh Commercial Gazette* from 1885 to 1895 and of the *Pittsburgh Chronicle Telegraph* from 1895 to 1901, and was editor of the *Pittsburgh Gazette* in 1901–05. He lectured on political science at Johns Hopkins University in 1906 and 1907, and in 1908 became professor of politics at Princeton University. Besides special articles on political science, Ford is author of *The Rise and Growth of American Politics* (1898) and *The Cost of our National Government* (1910).

FORD, JAMES LAUREN (1854–). An American humorist. He was born at St. Louis, Mo., and received an academic education at Stockbridge, Mass., but moved early to New York, where he held many editorial positions on newspapers and periodicals, either as editor, dramatic critic, literary critic, or as a special writer. He devoted much of his time to dramatic work and is the author or adapter of two successful plays. His humorous writings are, for the most part, in the form of satirical comments on current tendencies and affections in American literature, drama, and life. His writings include *The Literary Shop and Other Tales* (1894, 3d ed, 1899), *Hypnotic Tales* (1894), *The Third Alarm* (1893, new ed, 1908), *Bohemia Invaded* (1895); *Dr. Dodd's School*, *Dolly Dillenberg* (1895), *Cupid and the Footlights* (1899), *The Story of Du Barry* (1902), *The Brazen Calf* (1903), *The Wooing of Folly* (1906). He also edited, with Mary K. Ford, *Every Day in the Year* (1902, new ed, 1914).

FORD, JEREMIAH DENIS MATILIAS (1873–) An American professor of Romance languages. He was born at Cambridge, Mass., graduated (1894, Ph.D., 1897) from Harvard University, and studied also in various French schools. At Harvard he was instructor, assistant professor, and, after 1907, professor of the French and Spanish languages. In 1910–11 he was vice president of the Modern Language Association. He edited Goldoni's *Curioso Accidente* (1899), Moratin's *Si de las niñas* (1899), Alarcón's *Capitán Veneno* (1900), *A Spanish Anthology* (1901), *The Romance of Chivalry in Italian Verse* (1904, 2d ed, 1906), *Old Spanish Readings* (1906, new enlarged ed, 1911), *Selections from Don Quixote* (1908), and published *The Old Spanish Sibilants* (1900), *Exercises in*

Spanish Composition (1901), *Spanish Grammar* (1904). Ford was a contributor to the *NEW INTERNATIONAL ENCYCLOPEDIA*.

FORD, JOHN (fl. 1639). An English dramatist of good county family and singular among his contemporary playwrights in not being dependent upon his pen for his support. He matriculated at Exeter College, Oxford—no university record of him remains, however—and became a bencher of the Middle Temple in November, 1602. His first publication was *Fame's Memorial* (1606), an elegy on the Earl of Devonshire. In 1606 also appeared *Honor Triumphant* and *The Monarches Meeting*, which present him in the light of one ready to use his pen for the entertainment of the court. *An Ill Beginning Has Good End*, which has been attributed to Ford, was played at the Cockpit in 1613. If this attribution be correct, it marks the beginning of his dramatic career. In collaboration with Dekker he wrote *The Fairy Knight* and *The Bristowe Merchant* (both licensed in 1624, but neither of them published), in collaboration with Webster, *A Late Murther of the Son upon the Mother* (licensed 1624), in collaboration, probably with Dekker and others, *The Sun's Darling* (acted 1624, printed 1657), and in collaboration with Dekker and Rowley, *The Witch of Edmonton* (acted probably c. 1621, but printed 1658). Of the plays by Ford alone, *The Fancies*, *Chaste and Noble* (acted 1636, printed 1638) and *The Lady's Trial* (acted 1638, printed 1639) are by general consent dramatically failures, and his reputation rests mainly upon *'Tis Pity She's a Whore* (acted c. 1626), a tragedy of extraordinary power, dealing with the passion of a brother for a sister; (translated into French by Maeterlinck in 1894 and played in that year in Paris under the title *Annabella*), *The Lover's Melancholy* (acted 1628, printed 1629), impressive by the depth of its pathos, but weak in its comic scenes, *The Broken Heart* (acted c. 1629), as good as anything of this author's, unless *'Tis Pity She's a Whore* be given first place, and notable among his plays for its skillful construction, for its comparative freedom from the morbidity of theme to which he was prone, for its tragic intensity, and for various other excellences, both major and minor, and *Perkin Warbeck* (printed 1634, probably acted 1635), an historical drama, which Hartley Coleridge doubtless overpraised in declaring it the best historical play outside of Shakespeare's national histories, but which still ranks high among its contemporaries of the same kind. Regarding Ford's place as a dramatist, Lamb declared in effect that Ford was of the first order of dramatic poets, and Swinburne, in one of his essays, has gone almost an equal length in the way of praise. On the other hand, Hazlitt regards the weakness of his comic vein, his extravagance, and "a certain perversity of spirit" as sufficient seriously to mar his fame. Though Ford lacks the magic of verse and phrase that distinguish the greatest of his contemporaries, his blank verse is still at its best a noble medium of music and expression, and this, together with the dramatic beauty and intensity of scenes and passages scattered through his plays, gives him a secure place in the great succession of Elizabethan dramatists. The best edition of Ford is that of Gifford, revised by Dyce, which contains a memoir (1869). Consult also *Dramatic Works of Massinger and Ford* (1840, 1883),

with introduction by Hartley Coleridge, *Best Plays of Ford* ("Mermaid Series," 1888, 1903), ed by Havelock Ellis, Emil Koepfel, *Quellen Studien* (Strassburg, 1897), W Bang, *Materi- alen zur Kunde des alteren englischen Dramas*, vol xiii (Leipzig, 1906)

FORD, JOHN DONALDSON (1840-1918) An American naval officer, born at Baltimore, Md He graduated from the Maryland Institute School of Design in 1861 and from the Potts School of Mechanical Engineering in 1862 Entering the navy as third assistant engineer, he was at Baton Rouge, La (1863), Mobile Bay (1864), and on the ill-fated *Arizona* (1865) In 1867 he was wrecked in the *Sacramento* on the Coromandel coast of India He was detached from regular service in 1884 to organize the Baltimore Manual Training School In 1894-96 he taught at the Maryland Agricultural and Mechanical College, and in 1898, becoming fleet engineer of the Pacific station, was with the Asiatic fleet during the Spanish-American War In 1902 he was promoted captain and later in the same year was retired with the rank of rear admiral, but continued to serve as inspector of ordnance and machinery until 1908 He published pamphlets on manual training in public schools, professional papers, and *An American Cruiser in the East* (1898)

FORD, JOHN THOMSON (1829-94) An American theatrical manager, born at Baltimore He became manager of the Holliday Street Theatre in Baltimore, where he was elected president of the municipal council (1858) and was acting mayor for two years In Washington, D C, he built three theatres, one of which was that known as Ford's Theatre, the scene of the assassination of President Lincoln by Booth on April 14, 1865 On suspicion of complicity, he was arrested, but after 40 days' imprisonment was released, as no evidence was adduced against him In 1871 he built Ford's Grand Opera House at Baltimore

FORD, PAUL LEICESTER (1865-1902) An American historian and novelist, born in Brooklyn, N Y He was privately educated, and after wide travels in both hemispheres he devoted himself to investigations in the sources of American history and edited the *Writings of Thomas Jefferson* (10 vols, 1892), the *Writings of John Dickinson* (2 vols, 1893), *The Federalist* (1886), etc These studies led to *The True George Washington* (1896), *The Many-Sided Franklin* (1899), and *The New England Primer*, with many minor writings of like character To fiction he contributed *The Honorable Peter Sterling* (1894), *The Great K & A Train Robbery* (1897), *The Story of an Untold Love* (1897), *Tattle Tales of Cupid* (1898), *Jamie Meredith* (1899), *Wanted A Matchmaker* (1901); *Wanted A Chaperon* (1902) Mr Ford also did valuable work in the *Bibliographer*, which he founded, and of which he was editor at the time of his death

FORD, RICHARD (1796-1858). An English writer He graduated at Trinity College, Oxford, in 1817, and was afterward called to the bar, but never practiced He spent four years traveling in Spain and in 1845 published his delightful *Handbook for Travelers in Spain*, in two volumes A second edition (1847) was in one volume, and the material left out was published in *Gatherings from Spain* (1846) Ford also contributed important papers on Spanish art to the *Quarterly Review* and other periodicals He wrote letterpress for several ait

works, notably the *Tauromachia* (1852) of Lake Price

FORD, SIMEON (1855-) An American hotel proprietor, born at Lafayette, Ind, and educated in the public schools For many years he was proprietor of the Grand Union Hotel, New York City—until it was closed in 1914 He became a member of the firm of Ford & Shaw, president of the Official Hotel Red Book and Directory Company, of the Rye Land and Improvement Company, and of the Zeeland Realty Company, and director in various corporations Widely known for his after-dinner speeches, he published some of these, together with addresses, as *A Few Remarks* (1903)

FORD, WILLIAM WEBBER (1871-) An American bacteriologist He was born at Norwalk, Ohio, and graduated from Western Reserve University in 1893 and from Johns Hopkins University (MD) in 1898 He was also a fellow of McGill University (1899-1901) and of the Rockefeller Institute, New York City (1901-02) At Johns Hopkins he was instructor (1903-05), associate (1905-06), and associate professor of bacteriology and hygiene and lecturer on legal medicine (after 1906) He became a member of several scientific and professional societies He is author of papers on intestinal bacteria, diseases of the liver, toxins and antitoxins, water supplies, milk, sewage, and typhoid fever

FORD, WORTHINGTON CHAUNCEY (1858-) An American author and statistician, born and educated in Brooklyn, N Y He was, from 1885 to 1889, chief of the Bureau of Statistics of the Department of State in Washington, from 1893 to 1898 chief statistician of the Treasury Department, and from 1902 to 1909 chief of the division of manuscripts in the Library of Congress In 1909 he became editor of the publications of the Massachusetts Historical Society and in 1910 lecturer at Harvard He wrote *The American Citizen's Manual* (1883), *The Standard Silver Dollar* (1884), *George Washington* (1899, rev ed, 1910), and numerous monographs on historical, biographical, and economic subjects He revised David A Wells's *Natural Philosophy* (1879), and edited the *Correspondence and Journals of Samuel Blachley Webb* (1893-94), *The Writings of George Washington* (1889-91); the *Journals of the Continental Congress*, *Bibliography of the Massachusetts House Journals*, 1715-76 (1905), *John Quincy Adams* (1902), *List of B Franklin's Papers in the Library of Congress* (1905), *Writings of John Quincy Adams* (3 vols, 1913)

FORD CITY A borough in Armstrong Co, Pa, 40 miles northeast of Pittsburgh, on the Pennsylvania Railroad, and on the Allegheny River (Map Pennsylvania, C 5) It is in an agricultural and coal-mining region and has manufactories of plate glass The water works and electric-light plant are owned by the city Pop, 1900, 2870, 1910, 4850

FORDHAM. Formerly a village in Westchester Co, N Y, situated on the east bank of the Harlem River (Map Greater New York, E 3), but since 1898 included in the city of Greater New York The first permanent settlement in this vicinity was made in 1671 by a Dutchman named Jan Arca, who bought the tract from Andrian Van der Donck and the Indians Fordham University (qv) was founded here in 1841 as St John's College. There is

also the cottage in which Edgar Allan Poe lived from 1844 to 1849

FORDHAM UNIVERSITY, formerly **ST JOHN'S COLLEGE** A Roman Catholic institution, directed by the Fathers of the Society of Jesus in Bronx Borough, New York City, adjoining Bronx Park and the Botanical Gardens which were formed in part out of land formerly belonging to the college St John's College was begun as the New York Diocesan College and Seminary by Archbishop Hughes in 1839 He purchased for that purpose, in the village of Fordham, for \$30,000, the old Rose Hill manor house and 98 acres of land Tradition says that this was where Cooper found the scene for his novel *The Spy* St John's College was opened with six students, June 24, 1841 The Rev John McCluskey (afterward the first American Cardinal) was its president, and its faculty was secular priests and lay instructors The ecclesiastical part or seminary was called St Joseph's and was in charge of Italian Lazarists, with the Rev Dr Felix Villanis at its head It had 14 students After several years of this secular administration Archbishop Hughes invited the Jesuits to take charge, and a number of the order came to New York from St Mary's, Washington (now Marion) Co, Ky, for that purpose The Rev Augustus J Thébaud was the first rector of both college and seminary The New York Legislature granted the college its charter to give degrees in theology, arts, law, and medicine, April 10, 1846 In 1856 Archbishop Hughes resumed direct control of St Joseph's Seminary and returned its management to secular priests It was moved to Troy and opened there Oct 18, 1864 In 1896 it was moved to its present location, Dunwoodie, Westchester County On June 21, 1904, the board of trustees of St John's authorized the opening of law and medical departments in addition to the Arts course and on March 7, 1907, the charter was amended by the regents of the State University to formally establish this, and allow St John's College to change its corporate name to Fordham University In 1912 a College of Pharmacy was opened The grounds cover 70 acres, upon which are erected 10 buildings for the use of the faculty and students In 1914 the number of students at the university was 1500 There were 140 professors and instructors, and the library contained 60,000 volumes The president in 1914 was Thomas J McCluskey, S J Consult T G Taaffe, *History of St John's College, Fordham, N Y* (New York, 1891)

FORDIL'LA (Neo-Lat, named in honor of the discoverer, S W Ford) A small bivalve shell found in the limestones of Lower Cambrian age of Rensselaer and Columbia counties, New York See **CAMBRIAN SYSTEM**, **PELECYPODA**

FORD'S THEATRE A Washington theatre, in which President Lincoln was assassinated by Booth, April 14, 1865 The building was purchased in 1866 by the United States government and was used until 1887 as the Army Medical Museum and later as the Pension and Records Bureau of the War Department It collapsed, with the loss of many lives, on June 9, 1893

FORDUN', JOHN OF (?-c 1384) A Scottish historical writer He was probably a chantry priest in the cathedral of Aberdeen He is said to have traveled on foot through Britain and Ireland in search of materials for a chronicle of

Scotland, which he had set himself to compile This was probably between 1363 and 1384 He died probably in 1384, or a little later His *Chronica Gentis Scotorum* consists of five books, extending to 1153, and a part of book vi, which deals with English history His *Gesta Annalia* extend from 1153 to 1383 The work which John of Fordun left unfinished was continued by Walter Bower (qv) Bower gives him credit for the first five books of the *Chronica Gentis Scotorum* and part of the sixth, but claims the last 10 books (*Gesta Annalia*) as his own He used Fordun's material, however, up to 1371 The whole was published under the name of *Scotichronicon*, and it is the chief authority for the history of Scotland prior to the fifteenth century, its value being greatest for the fourteenth, where it is contemporary Four printed editions have been published, of which the best is that by Skene (Edinburgh, 1871-72), from the text of the Wolfenbüttele and other standard manuscripts Bower's interpolations and additions are separated from Fordun's text Consult Maxwell, *Early Chronicles Relating to Scotland* (Glasgow, 1912)

FORDYCE, för'dis A town and the county seat of Dallas Co, Ark, 78 miles south of Little Rock, on the Chicago, Rock Island, and Pacific, and the St Louis Southwestern railroads (Map Arkansas, C 4) Its chief industry is the manufacture of lumber, staves, and spokes Pop, 1900, 1710, 1910, 2794

FORECAST, WEATHER See **METEOROLOGY**, **WEATHER BUREAU**

FORECLOSURE. The legal process whereby a mortgagor's right, or "equity," of redemption is cut off and the mortgagee's title to the mortgaged lands or goods perfected In order to put a limit on the "equity of redemption" of the mortgagor (see **EQUITY OF REDEMPTION**) the remedy of foreclosure was devised by the Court of Chancery It is available to the mortgagee at any time after default and is instituted by a bill of foreclosure praying that an account may be taken of the principal and interest due under the mortgage, and that the mortgagor, on failing to pay the mortgage debt by a specified date, may forfeit his equity of redemption If on the day fixed for payment the money be not forthcoming, the mortgagor will be declared to have forfeited his equity of redemption, and the mortgagee will be allowed to retain the estate in perpetuity This method of enforcing the security of the mortgagee of lands is still in use in England and in many of the United States

In a few of the American States, however, in which the mortgage has come to be regarded as a mere lien, and not as a legal estate in the mortgagee, a statutory process, known also as a foreclosure, has been adopted in lieu of the foregoing process of "strict" foreclosure This differs from the older method principally in the fact that it involves the satisfaction of the debt, not by a forfeiture, but by a sale of the mortgaged premises The suit, which is also in equity, is instituted by the mortgagee as plaintiff, the mortgagor and all creditors, subsequent lienors, and other parties in interest, being made defendants The demand is for a judgment that the defendants be foreclosed and cut off from all their interest in the mortgaged premises, and that the same be sold to satisfy the mortgage debt The sale is made upon notice and is at public auction, generally by the sheriff or a referee appointed by the court. After the sale

the money in the hands of the referee will be applied to the payment of the mortgage, and any surplus may be claimed by subsequent mortgagees, or, if there is no other claim upon it, it will be paid to the mortgagor. Other methods of effecting a foreclosure, by legal rather than equitable process, as by a writ of entry or of ejectment directed by the mortgagee against the mortgagor, also occur in a few States. See EQUITY OF REDEMPTION, MORTGAGE, and the authorities there referred to.

FOREFANG See FORFANG

FOREIGN ATTACHMENT A process which a few local courts of England have authority, by immemorial custom, to issue. The custom of the Mayor's Court of London is that when a foreigner defendant, of whom the court has jurisdiction, does not appear in response to a summons served on him, the plaintiff may attach his goods or debts due to him as security to enforce his appearance. Recent decisions of the House of Lords have so narrowed the custom and have pointed out so many difficulties of procedure under it that it has fallen into disuse. In this country the attachment or garnishment of the goods or debts of nonresidents is regulated by statutes in the several States. See ATTACHMENT, GARNISHMENT, and the authorities there referred to.

FOREIGN JUDGMENT The judgment of a tribunal in a jurisdiction independent of that in which it is sought to be enforced. The effect to be given to such a judgment depends either upon treaty or the comity of nations. A government is not bound to enforce a judgment rendered in another country, nor even to recognize its existence, unless it has bound itself by treaty to do so. As a matter of courtesy, however, towards sister states, as well as from considerations of convenience to suitors, every civilized nation is accustomed to treat a foreign judgment as conclusive upon the parties thereto concerning the matters decided by it, unless it is shown that the judgment was obtained by fraud, or that the court granting it did not have jurisdiction.

The States of the United States are foreign to each other so far as their judicial systems are concerned. They are subject, however, to the Federal Constitution, which declares that "full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State. And the Congress may by general laws prescribe the manner in which such acts, records, and proceedings shall be proved, and the effect thereof" (Art. IV, Sec. 1). This does not mean that a judgment obtained in one State can be enforced by an execution issued in another State. It only means that if an action is brought upon such judgment in another State, or if the judgment is pleaded there in bar to an action brought for the same cause, it shall receive the same credit that it would receive in similar circumstances in the State where it was rendered. The refusal of some States to recognize a judgment or decree (as a decree of divorce) rendered in another State is based on the finding that such judgment or decree is a nullity because fraudulently obtained or because the court rendering it acted beyond its jurisdiction. In other words, a foreign judgment is entitled to recognition only if it is a valid judgment in accordance with the law governing the tribunal by which it was rendered.

By common law a foreign judgment is proved by an exemplified copy under the great seal of the State, or by a true copy proved to be such by a witness who compared it with the original, or by the proper certificate of an officer duly authorized by law. Special methods of proving such judgments are provided by statute in the various States. (See DIVORCE, JUDGMENT). Consult A. C. Freeman, *Treatise on the Law of Judgments* (4th ed., San Francisco, 1892), H. C. Black, *Handbook on the Law of Judicial Precedents* (St. Paul, 1912), H. W. Seton, *Forms of Judgments* (7th ed., Toronto, 1912), J. R. Rood, *Leading and Illustrative Cases with Notes on the Law of Judgments* (3d ed., Ann Arbor, 1913).

FOREIGN LAW The law of a foreign country. The law of a state is, under modern conditions, entirely without authority in any other country, though foreign states may, as a matter of international comity, recognize the validity of acts legally performed in other countries, and may even, under proper conditions, administer the rules and principles of foreign law in its own tribunals. As to the circumstances under which this will be done, see CONFLICT OF LAWS.

For judicial purposes the several States of the Union are foreign to each other, though the comity subsisting between them is of the strongest character, and the Constitution of the United States (Art. IV, Sec. 1) requires the recognition by one State of the validity of judicial acts of another. See FOREIGN JUDGMENT, EXTRADITION.

The courts of a country do not take judicial notice of foreign laws, but, where they are in issue, require them to be proved as matters of fact. Foreign statutory law may be proved by duly certified copies of the statutes in question, or even by printed compilations issued by the authority of the state enacting them. Foreign customary, or unwritten, law, however, can be proved only by the sworn testimony of properly qualified experts, though it has been held in the United States that the law of a kindred system like that of England may be established for judicial purposes by the citation of reported cases and textbooks of recognized authority. The Federal courts of the United States, however, even in matters in which they have no jurisdiction, will always take judicial notice of the laws of all the States. See COMITY OF NATIONS, INTERNATIONAL LAW.

FOREIGN MONEY, VALUE OF. For the purpose of fixing the rates at which the different foreign coins shall be computed for the purpose of determining the values of goods imported into the United States, it is made the duty of the Director of the Mint to publish from time to time the values of foreign coins. This was formerly done annually, but the fluctuating value of silver coins led in 1890 to a change in the law, requiring the statement to be made quarterly. Gold coins are reckoned by comparing the number of grains of fine gold which they contain with the amount of gold in the dollar. Silver coins are reckoned at the average value of the pure metal they contain during the three months prior to the determination of their value. When the values are determined by the Director of the Mint and proclaimed by the Secretary of the Treasury, they are valid in estimating the value of imports for the succeeding three months. See accompanying statement for April 1, 1914.

VALUES OF FOREIGN COINS

COUNTRY	Legal standard	Monetary unit	Value in terms of U S money	Remarks
Argentina Republic	Gold	Peso	\$0 9648	Currency Paper, normally convertible at 44 per cent of face value, now inconvertible
Austria	Gold	Krone	2026	
Belgium	Gold and silver	Franc	1930	Member Latin Union, gold is actual standard
Bolivia	Gold	Boliviano	3893	12½ bolivianos equal 1 pound sterling
Brazil	Gold	Milreis	5462	Currency Government paper normally convertible at 16 pence (= \$0 3244) per milreis
British Colonies in Australasia and Africa	Gold	Pound sterling	4 8665	
British Honduras	Gold	Dollar	1 0000	
Bulgaria	Gold	Lev	1930	
Canada	Gold	Dollar	1 0000	
Chile	Gold	Peso	3650	Currency Inconvertible paper
		Amoy	8318	
		Canton	8293	
		Cheefoo	7955	
		Chin Kiang	8125	
		Fuchau	7694	
		Haikwan	8463	The tael is a unit of weight, not a coin The customs unit is the Haikwan tael The values of other taels are based on their relation to the value of the Haikwan tael
		(customs)		
		Hankow	7782	
		Kiaochow	8060	
		Nankin	8237	
		Niuchwang	7800	The Yuan silver dollar of 100 cents is the monetary unit of the Chinese Republic, it is equivalent to 644+ of the Haikwan tael
		Ningpo	7997	
		Peking	8109	
		Shanghai	7598	
		Swatow	7683	
		Takau	8370	
		Tientsin	8060	
		Yuan	5390	
		Hongkong	5471	
		British	5471	
		Mexican	5511	Mexican silver pesos issued under Mexican decree of Nov 13, 1918, are of silver content approximately 41 per cent less than the dollar here quoted, and those issued under decree of Oct 27, 1919, contain about 51 per cent less silver
China	Silver	Tael		Currency Government paper and gold
Colombia	Gold	Peso	9733	
Costa Rica	Gold	Colon	4653	
Cuba	Gold	Peso	1 0000	
Denmark	Gold	Krone	2680	
Ecuador	Gold	Sucre	4867	
Egypt	Gold	Pound (100 piasters)	4 9431	The actual standard is the British pound sterling, which is legal tender for 97½ piasters
Finland	Gold	Markka	1930	
France	Gold and silver	Franc	1930	Member Latin Union, gold is actual standard

FOREIGN WARS, MILITARY ORDER OF An hereditary patriotic society instituted in New York City in 1894, as the Military and Naval Order of the United States, but known under its present name since 1895. The objects of the order are to honor and preserve the names and memory of those who aided in maintaining the United States government in the five foreign wars in which it has been engaged—viz, the War of the Revolution, the War with Tripoli, the War of 1812, the Mexican War, and the War with Spain—and to collect the records and documents relating to these wars. It admits to membership Veteran Companions, consisting of commissioned officers of the army, navy, and marine corps of the United States who participated in any of these foreign wars, and also Hereditary Companions, direct lineal descendants of commissioned officers in the male line. The national organization is made up of 20 State commanderies. The order had in 1914 a membership of over 1500 companions, among whom were many of the leading officers of the army and navy. This order has been officially recognized by several European monarchs.

FOREIGN WEIGHTS AND MEASURES.
See WEIGHTS AND MEASURES

FOREKNOWLEDGE AND FOREORDINATION Terms of theology, signifying God's knowledge of all things before they come to pass (foreknowledge), and the eternal purpose which finds its execution in the history of man (foreordination).

There have been various theories of foreknowledge. (a) It is viewed simply as one of the divine perfections, absolute because the nature of God is infinite, and thus embracing all events whatsoever, including the volitions of free beings, but capable of no explanation except that it is a fact of the nature of God. Foreknowledge is no more of a mystery upon this view than any knowledge, or any other attribute of God. (b) A kindred view adds an element of explanation from the "ideality of time." There is no time to God, and hence foreknowledge, in the human sense of that word, does not exist. To know the future does not essentially differ from the knowledge of the present, for all the future is present to God. (c) Foreknowledge depends upon foreordination. God has in some sense foreordained all things, and what He foreordains He knows, not with an immediate vision, as is supposed by the previous theories, but by the knowledge of inference and imagination. (d) The foreknowledge of God is limited by the freedom of man, inasmuch as he cannot foreknow contingent volitions which are essentially uncertain. This is a voluntary self-limitation, since God has Himself given His creatures freedom. This theory has been proposed at various periods in history, but has always met with criticism as militating against the infinity of God. It is, however, finding increased favor at the present day in many quarters.

The proofs of God's foreknowledge have been derived from the perfection of God and from the Scriptures. Even men have a certain kind and degree of foreknowledge, which is absolutely essential to them in the regulation of life. If God were nothing more than an infinite man, He must have at least the same sort of foreknowledge and in an infinite degree. This proof

is reinforced by the Scriptures, which ascribe the most various and minute foreknowledge to God. Yet neither of these proofs goes so far as they have often been supposed to go. Nothing in Scripture answers the question whether free volitions are in themselves subject to foreknowledge. Many are, for, though free in their essential nature, they are made in conformity with the balance of motives and may be foreknown. This fact is the foundation of society. But, while volitions remain free, are there none that are unaccountable, against the balance of motives, and hence uncertain? That is the question of free will (qv), and it would be false exegesis which would rest its determination upon passages of Scripture.

Foreordination pertains to all events. So much is maintained by all theologians. Some teach that all events are embraced in foreordination in the same sense and way. This theory differs from fatalism because intended to be consistent with the freedom and responsibility of the creature, and it may be consistent if determinism (see FREE WILL) is consistent, as was maintained by Edwards and many others. Some types of Calvinism made a distinction between foreordination and permission. The first sin of man is then said to have been permitted, and the lost are said not to have been "reprobated," but "passed over" by electing grace, i.e., left in the sinful state into which they have voluntarily brought themselves (so the Westminster Confession). Others, with more direct reference to free will and with a conception of the divine government as a moral government—i.e., one through persuasives acting upon the will—have said that foreordination is the determination in the first instance as to what God will Himself do. From what He does, often follows immediately what men do, as in regeneration which leads to conversion, or when He does not do what would prevent sin. Thus He often indirectly foreordains what men shall do. This indirect foreordination will ultimately extend to the entire circumference of the government of God, and it will be in such a sense that it can be said that God foreordains "whatsoever cometh to pass." The divine government embraces all things even when it is in part a government of permission.

The existence of God involves the idea of plan (teleological argument), and plan is foreordination. Conceived as the plan of the world and of the history of man, foreordination may be interpreted by the actual course of events.

The grounds of this plan are to be found in the infinite wisdom and goodness of God. Whatever may be the success with which various schools have made this clear, such has been the meaning of all theologians. The most extreme schools of supralapsarians have believed that the lost were lost in consequence of their own sin, for which they were guilty, and which deserved in justice precisely the punishment they received, and they have also believed that justice must be done, and that neither wisdom nor goodness could permit it to go unsatisfied. The doctrine of election, which is but a corollary of foreordination, has often been regarded as a doctrine of favoritism. But theologians have never meant this by it. They have always founded it in the wisdom and goodness of God. They have often maintained that God elected every one who could be gained to righteousness by all the resources of His government. They have sometimes taught that more efforts were put forth

for the finally lost than for some who were actually saved. The differences between the schools upon this doctrine have often been resolvable into this, that some referred a given fact to God, because it was under His government though by permission, while others ascribed it purely to man because done by him, though confessedly under a governmental permission.

The consistency of plan with free agency must be a real consistency under the divine government because it is real under human governments. A human governor can successfully determine to conquer a country under the conditions in which he is placed, and can successfully carry out his determination, as when Frederick the Great conquered Silesia. God can do the same. The attempts of philosophy to explain this consistency do not affect its reality, whether more or less successful. Calvinism has been especially concerned with these doctrines. Consult Calvin's *Institutes*, Edwards's *Freedom of the Will*, the *Westminster Confession*, Mozley, *Treatment on the Augustinian Doctrine of Predestination* (London, 1855), McCabe, *The Foreknowledge of God and Cognate Themes* (New York, 1878), Bruce, *The Providential Order of the World* (New York, 1899), Richards, *God's Choice of Men* (New York, 1905). See FREE WILL.

FOREL, fô'rêl', AUGUSTE [HENRI] (1848–) A Swiss entomologist and psychologist. He was born at Morges (Canton of Vaud), studied at the universities of Zurich and Vienna, became a lecturer at Munich in 1877, and after 1879 held the chair of psychiatry at Zurich, from which he resigned in 1897. He was connected as assistant and director with various institutions for the insane. His works include the prize essay *Les fourmis de la Suisse* (1874), *Der Hypnotismus* (1889, 6th ed, 1911, Eng trans by Armit, 1906), *Gehirn und Seele* (1894, 11th ed, 1910), *Die psychischen Fähigkeiten der Ameisen und einiger anderen Insekten* (1901–04, trans by Wheeler, *Ants and Some Other Insects*, 1912), *Hygiene der Nerven und des Geistes* (1903, 4th ed, 1913, Eng trans by Aikins, *Hygiene of the Nerves and Mind*, 1907), *Die sexuelle Frage* (1905, 9th ed, 1909, new ed, 1913, *The Sexual Question*, trans by Marshall, 1908), *Sinnesleben der Insekten* (1886, 1910, Eng trans by Yearsley, 1908).

FOREL, FRANÇOIS ALPHONSE (1841–1912). A Swiss physician and naturalist, brother of the preceding, born at Morges (Canton of Vaud). After medical studies he was appointed professor of anatomy and physiology in the University of Lausanne. His studies concern the glaciers and lakes of Switzerland and earthquakes, on which he became an international authority. He invented a xanthometer. His writings appeared in *Le Léman* (3 vols, Paris, 1892–1904) and in the *Handbuch der Seenkunde* (Stuttgart, 1901).

FORELAND, NORTH AND SOUTH. Two promontories on the east coast of Kent, England—**NORTH FORELAND**, the Cantium of Ptolemy, forms the northeast point of the county, and is in lat. 51° 22' N, 2 miles east of Margate, on the Thames estuary (Map England, H 5). Its chalk cliffs, 188 feet high, projecting into the North Sea, are crowned by a lighthouse, with a fixed light, 184 feet high, visible 24 miles—**SOUTH FORELAND**, also composed of chalk cliffs, 16 miles south of North Foreland and 3 miles northeast of Dover, has

two fixed lights, respectively 375 and 290 feet above the sea and visible about 25 miles (Map England, H 5). They indicate the proximity of the dangerous Goodwin Sands (qv) and the anchorage of the Downs (qv).

FORENSIC MEDICINE. See MEDICAL JURISPRUDENCE.

FOREORDINATION. See FOREKNOWLEDGE AND FOREORDINATION.

FORESHORE. In English law, the sea-shore, the strip of land subject to the ebb and flow of the tide and lying between the ordinary high-water and low-water mark. The title to the foreshore is at common law *prima facie* in the crown, but may be shown to have become vested in a subject either by grant from the crown or by evidence from which a grant can be presumed. It has been contended by eminent authority (Stuart Moore, *History of the Foreshore*) that the presumption should be the other way, in favor of the subject's title instead of that of the crown, but, however this may be, the law has come to be settled the other way, in this country generally (though not universally) as well as in England. For the rights and liabilities with respect to the foreshore, especially of the public and of adjoining owners, see the title SEASHORE.

FORESHORTENING. That view of a figure or portion of a figure which, obeying the laws of perspective, diminishes in actual extent according to the angle at which it is seen. For example, a figure looked at from below becomes condensed, as it were, in length, and in portraying such an abrupt view there would be less space demanded than if the figure stood upright on the same level as the observer. In the same sense an arm extended and pointing directly out of the picture would require less actual space on the canvas than an arm laterally extended. The representation, then, of this effect of reduced space suggesting at the same time the actual length of the object, is termed foreshortening. It is practiced more or less by all painters as occasion demands, and it is always called for in the painted ceiling, where figures are represented as above one's head. Some of the chief masters of foreshortening among the Italians were Melozzo da Forlì, Luca Signorelli, Michelangelo, Tintoretto, and, especially, Correggio, who in his frescoes of the cupola of Parma went further than had any before him. His example was followed by painters of the baroque and rococo period, who often introduced foreshortening into their works merely for the purpose of parading their technical skill. In modern times greater care prevails, and foreshortening is practiced only with reference to the laws of perspective. Consult G. A. Storey, *The Theory and Practice of Perspective* (London, 1910).

FOREST (OF forest, Fr *forêt*, It, ML *foresta*, forest, from Lat *foras*, *foris*, out of doors, *fores*, door, Gk *θύρα*, *thýra*, OChurch Slav. *двери*, Lith *dūrys*, Goth *dairōns*, OHG *tura*, Ger *Thur*, AS *dairu*, Eng *door*). A tract of land covered with a natural growth of trees. From the standpoint of vegetation the world may be roughly divided into forest, grassland, and desert, the area of each being determined by various climatic factors. Among these climatic factors atmospheric moisture takes a prominent place, as can readily be seen in comparing a vegetation chart of the world with a rainfall chart. Other things being equal, the greater the rainfall, the

richer the forest. Forests seem to be in a measure independent of the seasonal distribution of rain, since they occur in regions of daily rain, of summer rain, or winter rain. Endurance through dry seasons is made possible by the great depth of tree roots, and also by the thick and leathery leaf texture in the case of evergreens, or by the shedding of leaves in deciduous trees. Because of the heat, more water is required by a tropical forest to meet the demands of transpiration than by a forest in the temperate zone. Another factor, perhaps of equal importance with moisture, is wind. Kihlman has shown that the presence or absence of trees in Arctic regions is not a question of cold, nor even of a season's length, but of winter winds; trees grow only where they are protected from the great loss of water by transpiration induced by dry winter winds by being buried under the snow, the height of the trees thus marks the winter level of the snow. Since the winds of eastern Argentina are strong during the resting period, grassland is present, though the moisture is sufficient for a forest.

The forest formations of the world may be divided into eight types, based chiefly on the ecological characters of the leaves. (See LEAF.)

- 1 The evergreen forest of the tropical regions of diurnal rainfall. This forest is especially well developed in the regions of the trade winds in oceanic climates, as of Brazil and Malaysia. This type is often called the rainy forest and may be taken as representing the climax of the world's vegetation. Here plants grow in vast profusion and great diversity of form, and lianas, or climbing plants, and epiphytes reach their greatest development. Simultaneous periodicity is largely wanting, so that the forest is always in active life.
- 2 The deciduous monsoon forest, especially characteristic of the monsoon district of India, differs from the forest first named chiefly in having simultaneous periodicity. The other characters of the rainy season are present, but in a less complete degree.
- 3 The evergreen forest of the temperate zone is essentially an extension of the tropical evergreen forest into the cooler regions, especially of the Southern Hemisphere. It is peculiar to pronounced oceanic climates with markedly uniform temperature and moisture.
- 4 The deciduous forest of the north temperate zone is the typical forest formation of the eastern United States. The forests of beech, maple, chestnut, oak, etc., are too familiar to need description. The radical difference between the forests of the same latitudes in the Northern and Southern hemispheres is doubtless associated with the continental climates of the one and the oceanic climates of the other.
- 5 The deciduous savanna forest of the tropical and warm temperate regions is transitional between forest and grassland (qv), having a parklike aspect, which is due to scattered trees in a district where grasses form the chief undergrowth. Such a forest commonly has a moderate rainfall.
- 6 The thorny or scrubby forest of tropical and warm temperate regions where the rainfall is slight is transitional between forest and thicket (qv).
- 7 The forest of temperate regions where the rainfall occurs in winter is finely shown in the Mediterranean region, coarse and leathery but large evergreen leaves, like those of the holly, laurel, oleander, and the evergreen oaks, may be taken as typical of such regions.
- 8 The conifer forests, the pines and firs with their leathery

needle-shaped evergreen leaves, form great forests in the colder regions of the temperate zones, especially of the Northern Hemisphere.

The forests heretofore discussed are all climatic and widespread. Edaphic (qv) or local forests also occur. Indeed, in most of the regions where the above climatic types are found, there are localities in which other forest combinations are present. For example, in a swamp in the deciduous zone of the northern United States there may be found tamarack, spruce, and white cedar. Close observation in such a place for many years would doubtless show the gradual dying out of these trees and their replacement by the ordinary members of the deciduous forest. On a hill there may often be found a pine-plant association, but this is not a permanent condition. Pines are often likely to be followed in a natural sequence by oaks, and they in turn by maples and beeches. These changeable plant associations may be called edaphic, while the ultimate forest towards which all are tending may be called the climatic formation. Viewed in this light, the eight great forest types outlined above are forest formations.

FORESTALLING. The buying of provisions with a view to enhancing the price thereof in open market. This was a common-law offense and was the subject of early and repeated legislation. It was described by Statute of 5 and 6 Edw. VI, c. 14, as the buying or contracting for any merchandise or victual coming in the way to market, or dissuading persons from bringing their goods or provisions there, or persuading them to enhance the price when there. It was analogous to engrossing (qv) and regrating (qv). Modern conditions of trade have rendered these practices legitimate and the laws intended to regulate them obsolete, while at the same time the abuses referred to have, under the name of "corners" and monopolies, become more flagrant and oppressive. The laws against forestalling and allied offenses against trade have long been obsolete and were formally repealed in England by Statute 7 and 8 Vict., c. 24. In the United States they have remained unenforced. Consult the authorities referred to under CRIMINAL LAW.

FOREST CANTONS, THE FOUR. The four cantons of Schwyz, Uri, Unterwalden, and Lucerne, in Switzerland.

FOREST CITY. A borough in Susquehanna Co., Pa., 23 miles north by east of Scranton, on the Delaware and Hudson, the Erie, and the New York, Ontario, and Western railroads (Map Pennsylvania, L 3). Coal mining and silk manufacturing are the chief industries, and there are important agricultural interests. Forest City was incorporated in 1888 and is governed by a burgess, quadrennially elected, and a unicameral council. Pop., 1900, 4279, 1910, 5749.

FOREST CITY, THE. A name given to Cleveland, Ohio, famous for its shade trees.

FOR/ESTER, FRANK. A nom de plume of Henry William Herbert (qv).

FORESTERS, ANCIENT ORDER OF. A fraternal organization founded in 1745 at Knaresborough Castle, in Yorkshire, England. The order was introduced into the United States in 1832 by the establishment of Court Good Speed, 201, in Philadelphia. In 1914 there were three high courts, and 439 subordinate courts in the United States, with a membership of about 50,000. The order throughout the world has about 1,600,000

members The order has courts in 36 countries, and a reserve fund of over \$50,000,000 Funds are raised by fixed dues, and more than \$5,000,000 annually are distributed in benefits

FORESTERS, INDEPENDENT ORDER OF A fraternal and benevolent society founded at Newark, N J, in 1874 and reorganized in 1881 The order is general throughout the United States and Canada and has branches in Great Britain, Norway, France, India, and Australia Its government is vested in a supreme court, with delegates from all the countries represented High courts, corresponding to the grand lodges of other societies, have supervision of the order in various states and countries There were in the United States in 1914 one high court and 4149 subordinate courts The members numbered 246,463 The disbursements since its organization aggregated nearly \$40,000,000, and the annual disbursement about \$3,500,000

FORESTERS OF AMERICA A benevolent and fraternal organization known under its present title since September, 1895 Originally the order was part of the Ancient Order of Foresters, founded in England in 1745, and introduced in the United States in 1832 In 1889, however, the American order freed itself from the jurisdiction of the high court in England and became a separate organization It had, in 1914, 18 grand courts and 1865 subcourts There were about 245,000 members The disbursements since its organization aggregate nearly \$35,000,000

FOREST FLY. The British name of a small, widely distributed fly (*Hippobosca equina*), representing that aberrant division of Diptera styled Eproboscidea (see **FLY**) and the family Hippoboscidae These minute insects are louse-like in appearance and habits, dwelling altogether as parasites among the hairs of animals and feathers of birds, and some forms are called "bird ticks" A common species on large birds in America is *Olfersia americana* Species of another genus, *Lipoptera*, have wings when young and live upon birds, but after a time they migrate to some mammal, and there, having no further use for their wings, wrench or bite them off Another genus, *Melophagus*, includes the wingless sheep ticks, a whole family, the spider-like bat ticks (*Nycteribidae*), inhabit the fur of bats alone, and another includes the bee louse (*Brauhidae*) All obtain their living by piercing the skin and sucking the blood with an extensible tube thrust out from the mouth An extraordinary feature in the economy of all these flies is that they do not lay their eggs, but retain them until they hatch into larvæ, and the larvæ are almost ready to pupate, not until then are they extruded by the parent, and only one is produced at a time Hence the group is sometimes named Pupipara by some systemists

FORESTI, fò-rës'tè, ELEUTARIO FELICE (1793-1858) An Italian patriot and scholar He was born at Conselice, graduated at the University of Bologna, practiced law at Ferrara, and in 1816 was made prætor at Crespino He was a member of the Carbonari and from 1819 to 1836 was imprisoned He came in 1836 to the United States He was for many years professor of Italian in Columbia College, and in 1858 he was appointed United States Consul at Genoa He published an edition of Ollendorff's Italian grammar (1846) and *Crestomazia italiana* (1846)

FOREST LAWS, IN ENGLAND Laws for the government of the forests in the King's possession Such forests were vast tracts of country, containing not only woodland, but pastures and even villages Smaller tracts of woodland were called chases, or, if inclosed, parks, and might be included in a royal forest The forests varied in number and extent at different times and were situated in different parts of the kingdom Among the best known were New Forest, in Hampshire, Windsor Forest, and Epping Forest

Most of them, indeed, dated from the Anglo-Saxon period and, having their origin in the unclosed woodlands which had been national property, became royal demesne in the eleventh century But all the Norman and early Plantagenet kings attempted, with varying success, to increase the forest area by afforestation—a summary proceeding, which consisted in simply proclaiming the desired tract a forest, after it had been inclosed with metes and bounds by royal commission Sometimes the people were allowed to remain, but subject to the strict forest law; often they were ruthlessly driven away The increase of the forest area was attempted not only by such high-handed monarchs as William I and his sons, but until the fourteenth century it was a recurring source of complaint against the kings Such wise kings as Henry II and Edward I were guilty of the same practice, and it was not until 1301 that the latter finally yielded to the wishes of his people and permanently put an end to afforestation by force When Henry VIII created Hampton Court Forest, he was obliged to pay the freeholders for the lands of which he deprived them, and even Charles I is said to have followed a like course when he created Richmond Park From early times a king had occasionally alienated a forest to an individual with authority to enforce the forest laws over them as he had done In the fourteenth century all the forests in the County of Lancaster were held by the earls of Lancaster subject to the same laws as those held elsewhere by the King

We have no means of determining the state of the law at the time of the Conquest A series of enactments attributed to Canute is of such uncertain authority as to have been rejected by Coke in 1548, and Dr Liebermann has recently shown that it is a forgery of about 1184 All that we know of his legislation on this subject is that he permitted every man to hunt in his own wood, but forbade trespassing in the King's forest

The terrible severities of the Norman period are usually said to have been introduced under Henry I, but in his charter of liberties Henry professes merely to retain the forests as his father had held them His law claimed supreme jurisdiction over private forests as well as over his own and prescribed terrible penalties for the killing of game, among which were death, blinding, and emasculation The Assize of the Forest, issued by Henry II in 1184, retains these punishments, but mitigates others and prescribes the limits of the jurisdiction of forest courts The extreme rigor with which this otherwise just King enforced the forest law gave cause for great complaint In the Great Charter John renounced his afforestments, promised reform of all bad customs, and excused from attendance on the forest courts those not living in the forest The Charter of the Forests, issued by the Earl Marshal for Henry III in 1217, was a still

more liberal document, greatly diminishing the punishments, the severest of which is now imprisonment for a year and a day. Besides confirming the provisions of Magna Charta, it permits freemen to exercise many other rights, such as those to mills, fish ponds, marlpits, arable land, falcons, etc., on their own land, within the forest. Renewed by Edward I and supplemented by another ordinance in 1306, it remained the basis of the forest laws of the kingdom.

In general, the inhabitants of the forest folds were subject to the royal rights of forestry. These were both of *vert*, i.e., to every kind of tree and brush in the forest, and *venison*, i.e., to every wild beast of the forest. They were not allowed to hunt or cut wood or brush on their own land without license of the royal official. They indeed retained some rights of pasture for *commonable* beasts (excluding sheep, goats, geese, and swine), but they might not use as much as would deprive the King's beasts of food.

The officers of the forest were numerous and important. In 1238 two provinces, divided by the river Trent, were established for forest administration, and a justice was appointed for each province. Under such justice was usually a warden for each particular forest, verderers, whose chief duties were discharged at the forest court and who were responsible to the King and not to the warden, foresters, whose duties were similar to those of a modern gamekeeper. Still other officers were the foresters in fee, woodwards, rangers, regarders, and agisters.

The forest courts were three in number, running parallel with the ordinary courts of justice. There was the *woodmote*, or court of attachments, held before the verderers every 40 days. It tried minor trespasses only and could not convict. The *swanmote* was held three times a year by the same officials, all freeholders of the forest being bound to attend. Presentments were made by a jury which tried and convicted, but did not pass judgment. This was reserved for the justices in eyre, who every third year held the *court of justice seat*, a supreme court of civil and criminal jurisdiction over all offenses committed in a forest, whether against the forest law or not.

The last important general forest legislation was passed by the Long Parliament in 1640. Charles I had been exacting fines for alleged encroachments on his forests, and Parliament replied with an act for the "certainty of forests," exempting from prosecution any alleged encroachments which were considered valid in the second year of James I. Since that act the laws of the forest have practically ceased. The crown still retains ancient forestal rights over private lands in Dean Forest and New Forest, but such rights survive as curious legal anomalies. During Queen Victoria's reign three of the royal forests, viz., Hainault, Whittlewood, and Wichwood, were disafforested by act of Parliament. It would be better, however, if the remainder, and particularly such as are near large cities, could be held as national parks and recreation grounds. This has recently been done in the case of Epping Forest near London and seems to be the probable destiny of others as well.

The royal forests of Scotland were nearly as numerous as those of England, and their area was larger in proportion to that of the country.

As in England, there was a special code for them. Indeed, this code is so much like the English that it seems to have been derived from it. The penalties, however, are not so severe, nor did afforestation play such a prominent part in the Scottish constitutional struggle as in the English. The best edition of the Scottish forest code is in the *Acts of the Parliaments of Scotland* (Edinburgh, 1844). The best study of the English forest law and procedure is Turner, *Select Pleas of the Forest* (London, 1901).

Bibliography. Most of the laws are given in convenient form by Stubbs, *Select Charters* (Oxford, 1895), they are published in full in the *Statutes of the Realm*, Record Commission, vol. 1 (1810), Coke's *Fourth Institute of the Laws of England* (London, 1548) is the earliest legal authority, and the most complete is Manwood's *Treatise of the Laws of the Forests* (ib., 1598). For good brief modern descriptions, consult Stubbs, *Constitutional History*, 1 (Oxford, 1896-97), "Forest Laws," in the *Encyclopædia of the Laws of England*, ed. by Ranton (London, 1895-98), Cox, *The Royal Forests of England* (ib., 1905), Townley, *English Woodlands and their Story* (ib., 1910).

FOREST OAK. A name sometimes given in commerce to the timber of *Casuarina torulosa*, and other species of the same genus, all Australian trees. In Queensland the wood is considered as one of the most valuable for fuel and is also split into shingles. It is light yellowish brown and prettily marked with short red veins. It is exported for use in cabinetwork for which purpose it is employed as veneer.

FOREST PARK. A village in Cook Co., Ill., 4 miles west of the city limits of Chicago, on the Chicago, Great Western, the Baltimore and Ohio Chicago Terminal, and the Minneapolis, St. Paul, and Sault Ste. Marie railroads, and on the Des Plaines River. It is mainly a residential suburb of Chicago and contains the well-known Harlem race track. There are several cemeteries here, among them Forest Home and Waldheim—the latter of note as the site of a monument to the anarchists executed for complicity in the riot in 1886. (See CHICAGO.) Settled in 1854, Forest Park was incorporated as Harlem in 1883, and its name was changed in 1907. It adopted the commission form of government in November, 1912. The village owns the water works and electric-light plant. Pop., 1900, 4085, 1910, 6594, 1920, 10,768.

FOREST PRESERVATION. See FORESTRY, LUMBER INDUSTRY.

FOREST RESERVES. See FORESTRY.

FORESTRY (from ML *foresteria*, *forestaria*, *forestage*, from *foresta*, forest). The economic management of trees as communities. It is distinct from arboriculture, which is more strictly concerned with the individual tree. Forestry looks to the conservation and utilization of the various forest products in order that the greatest returns may be obtained. It may apply to the planting of a new forest or the preservation of an old one, the reforestation of a mountain side, the prevention of ruthless forest destruction, or the utilization of the forest products as a crop. The uses of a forest are to supply timber, fuel, etc., to offer protection against winds, to conserve moisture, by storing up water or at least by checking its loss by seepage and evaporation, and to minister to the enjoyment of man in providing parks, game covers, etc. In many new countries forests are

considered detrimental to the growth of the varied interests upon which the new community is dependent, and they are removed as rapidly as possible. In older regions the lack of forests is keenly felt in various ways, and attempts have been made to restore, in part, the former wooded areas.

History. In some form forestry has been practiced in Europe for several centuries. The growing scarcity of timber and fuel began to be felt in England early in the sixteenth century, and attempts were made to supply the failing resources by making new plantations and by more scientific cutting of the native growth. About the beginning of the eighteenth century plantings were begun in Scotland and later in Ireland, now the artificially planted areas exceed the natural ones. About this time there was great activity in the introduction of foreign species of forest trees, many of which were so well adapted to their new conditions that in places there are to-day more exotic than native trees. In France, Belgium, Germany, and other parts of Europe extensive areas of forests are now under systems of management that result in increasing rather than in decreasing production. Old native forests have been cared for, and denuded areas reforested. Governmental, communal, and private forests alike are so managed as to provide the various objects for which they were designed. In Germany and France the management of forests has received the greatest attention and has been most systematically and scientifically conducted. Government schools are maintained for the education of skilled foresters, and special attention is paid this important subject.

Forestry in the United States. Forest regulation did not for a time seem as necessary in the United States, with its great forest wealth, as in Europe. However, with the destructive methods of lumbering and the enormous waste by forest fires, the supply has been so encroached upon that means have been taken to repair the damage and to provide against its continuance. Various States have enacted laws designed to correct the former abuses by granting bounties for tree planting and remission of taxes upon purely forest areas. The general government has also attempted to aid by laws providing for the acquirement of land upon the condition of planting a portion to trees. Since the laws enacted by the general government were improperly prepared, interpreted, and enforced, and have resulted in little good, they have been repealed. The greatest good has probably come from the reservation of extensive areas about the watersheds and sources of some great rivers. On July 1, 1913, there were in the United States 163 national forest reserves—on national forests, as they are designated—embracing 186,616,648 acres, situated in whole or in part in Arizona, Arkansas, California, Colorado, Florida, Idaho, Kansas, Michigan, Minnesota, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington, Wyoming, Alaska, and Porto Rico. These reserves were created by presidential proclamation, and their management is now confided to the Forest Service of the United States Department of Agriculture, having been transferred from the Department of the Interior in 1905. The Forest Service patrols the reserves as a protection against fire and trespass, devises plans for the conservative

use of the forests, sells timber under proper regulations, and supervises the grazing privileges and movement of stock through the reserves. Under what is called the Weeks Law the government is purchasing forest lands to protect watersheds in the White Mountain and southern Appalachian regions, and to June 30, 1913, 713,415 acres had been approved for purchase. In addition to national forests there are a number of State reserves, the object of which is mainly to prevent the too rapid escape of water in floods, and the succeeding periods of scanty water supply for irrigation and other uses. They are situated at the sources of water supplies and are patrolled to insure their safety against marauders and fires.

Forestry in Canada. The administration of all matters pertaining to the public forests of Canada is vested in a Director of Forestry under the Department of the Interior. The organization and objects are similar in many ways to those described above and include studies of forest resources, timber surveys, reforestation, fire protection, etc. Rangers are provided for the vast forest area, and much good has been accomplished in the suppression of forest fires. By the Act of May 19, 1911, and the amending Act of June 6, 1913, a system of Dominion forest reserves was provided, and there were set aside 23,017,504 acres, comprising 31 reserves, 13 being in British Columbia, 8 in Saskatchewan, 5 in Manitoba, and 5 in Alberta. The largest of these is the Rocky Mountains reserve in Alberta, on the east slope of the Rocky Mountains, containing, in 1914, 13,373,772 acres, divided into 5 administrative units each in charge of a forest supervisor. The width of the reserve varies from 12 to 100 miles, and it extends from the international boundary line northward 500 miles. The cutting of timber in the reserves is permitted under restrictions, also grazing, but permanent settlement is forbidden, although leases are granted for summer resorts, mining claims, and other specified purposes. The Province of Ontario has reserves amounting to 12,824,320 acres, and the Province of Quebec has 111,401,280 acres. The Dominion has a large area set aside for national parks, the chief of which are Rocky Mountain Park, Alberta, 1,152,000 acres, Yoho Park, British Columbia, 358,400 acres, Glacier Park, 299,520 acres, Jasper Park, Alberta, 640,000 acres. The parks are in charge of a general superintendent, assisted by five local superintendents.

Forest Trees. Forests are of two kinds, pure and mixed. The former are less common than the latter and are usually, though not always, composed of coniferous trees. One advantage of a pure forest is the greater ease in lumbering; one disadvantage is its liability to destruction by drought, insects, diseases, etc. Among species adapted to pure forests are pines, spruce, silver fir, Douglas fir, beech, and maple. Those doing best in mixed woods are larch, birch, poplar, ash, oak, chestnut, and walnut. Mixed forests can be grown, and often are grown, as a series of small colonies devoted to single species, but for general purposes mixed woods are most satisfactory. Since the requirements of different species differ as to light, moisture, and soil, the trees of mixed forests protect each other and the forest floor, as the ground is called, better than those of pure forests.

Reforestation. Forests when once depleted

are restocked in several ways. Although the setting out of young trees is one of the most expensive methods of restocking, it has been practiced to some extent in the plains region of the United States and extensively in England. The seeds are sown and the young trees reared in nurseries where the peculiar requirements of the seedlings can be carefully met. After a growth of several seasons the trees are set in the places where they are to grow. Where the surface of the land will permit, they are often cultivated like any other crop until they attain a size sufficient to care for themselves. Frequently, too, various crops are grown in the spaces between the rows. While expensive, this method is best adapted to the conditions in the prairie region of the western United States. A second method is that of hand seeding the region designed for the future forest. This method is followed in many places, but the difficulties of collecting and caring for the seed prior to seeding are so great as to make this method unsatisfactory, except where the former forest has been destroyed by fire or other means. Natural seeding is largely depended upon to restock scientifically managed forests, occasional seed-bearing trees being left for the purpose. In some places the practice of thinning out the growth is followed to give the new stock of seedlings the air and light they require. Lastly, sprouts or suckers from the stumps and roots of trees that have been cut are often used for restocking. This method will apply mainly to such broad-leaved species as renew themselves in this way. They should be cut while dormant. This is about the only way employed in the reproduction of coppice woods. (See COPSE.) As a rule, the conifers do not sprout from their stumps. Pruning and thinning must be given some attention. Natural pruning is most satisfactory and will be done by the trees themselves if they are planted close enough. In natural pruning the lower twigs and branches die because close planting prevents their obtaining sufficient light. In time these dead parts are broken off and their stubs are buried by the trunk as it increases in girth. Thinning, on the other hand, must be done from time to time so as to prevent overcrowding. When branches are cut off, the cut should be close to the main trunk, and where the wound is too large to heal over in a single year or possibly two, the cut surface should be protected against the entrance of fungi by painting it.

Economic Returns. The financial returns from forests depend upon a number of factors, but in any case they are tardy. In coppices the whole area may be cut over every 20 or 30 years, while forests grown for timber must of necessity be of greater age. By conservative management, where the land is not too valuable at the beginning and markets are convenient, it is believed that 4 per cent can be realized in European forests, and there are records of even greater returns in the United States. A 10-year-old plantation of hardy catalpa in Kansas is said to have yielded a net gain of \$197.55 per acre, which sum could have been increased by continuing the marketing over a longer period.

Since it has been shown that private holdings of forest areas can be so managed as to be a source of continual revenue without impairing the original capital, many large owners are availing themselves of the opportunity offered by the government to secure the aid of expert

foresters in planning their management. To provide experts schools of forestry have been established at Cornell and Yale universities, and forestry instruction is given in the agricultural and other colleges of a number of States.

Climatic Influence. The climatic influences of forests are very great. Whether forests are actually instrumental in securing greater rainfall is somewhat problematical. Observations covering a long period of years and a large extent of forest are not sufficiently abundant to determine this point. That they do aid very materially in conserving moisture is not to be denied, and as a factor in the distribution of water they are equally important. In tempering hot and cold winds and as wind breaks, they are of great importance. The temperature in a forest is lower in summer and warmer in winter than in an adjacent tract, and this influence may be exerted to a considerable distance. The use of forests as a means for reclaiming tracts of almost barren sand and for protecting regions against wind-shifted sand is well shown by some of the forests of France.

Forest Enemies. The worst enemy of forests is man, through the agency of destructive lumbering, forest fires, grazing of animals, especially sheep, insect attacks, and fungous diseases. Mixed forests are not so subject to great loss from the last two causes as pure woods, since the same fungus or insect seldom attacks any great number of species of trees. Consult Fernow, *Economics of Forestry* (New York, 1902), *History of Forestry* (Toronto, 1911), Gifford, *Practical Forestry* (New York, 1902), Green, *Principles of American Forestry* (ib, 1903), Brucken, *North American Forests and Forestry* (ib, 1908), Fron, *Sylviculture* (Paris, 1909), Forbes, *The Development of British Forestry* (London, 1910), Graves, *The Principles of Handling Woodlands* (New York, 1911), Allen, *Practical Forestry in the Northwest* (Portland, Oreg, 1911), Nisbet, *Elements of British Forestry* (London, 1911), Schlick, *Manual of Forestry* (ib, 1911), Hawley and Hawes, *Forestry in New England* (New York, 1912), Noyes, *Wood and Forest* (Peoria, Ill, 1912), *Reports of the Director of Forestry* (Ottawa, Canada). See ARBORICULTURE, FOREST.

FORESTRY ASSOCIATION, AMERICAN.

An association organized in 1882 and incorporated in January, 1897, with the following general objects: (1) the promotion of a business-like and conservative use and treatment of the forest resources of the United States, (2) the advancement of legislation tending to this end, both by the States and the Congress of the United States, the inauguration of forest administration by the Federal government and by the States, and the extension of sound forestry by all proper methods, (3) the diffusion of knowledge regarding the conservation, management, and renewal of forests, the proper utilization of their products, methods of reforestation of waste lands, and the planting of trees. The association accepts as members all who are interested in promoting the objects for which it is organized. It has taken an important part in the movement for the conservation of the forest resources of the United States which characterize the first decade of the twentieth century. It carries on an educational propaganda by which it enlists support in securing the proper use and conservation of the forests in every State of the Union, every province in Can-

ada, and every civilized or semi-civilized foreign country. The association is generally recognized as the leading exponent of forest conservation in the Western Hemisphere. In 1913, 11 committees investigated various forest conditions and reported at the meeting of the National Conservation at Washington in November of that year. These reports represent the most advanced thought of theoretical and practical experts in forestry in the United States and Canada. The membership of the Association is over 5000. It publishes a monthly magazine, *American Forestry*, which is the only national publication on forestry in the United States. The headquarters are in Washington, D. C.

FOREY, fô'râ', ELIE FRÉDÉRIC (1804-72). A French soldier. He was born in Paris, was educated at Saint Cyr, accompanied an expedition to Algeria in 1830, was made a brigadier in 1848, aided Napoleon III in 1851—notably by clearing the Hall of Deputies of those who opposed the coup d'état—and in 1852 attained the rank of general of division. He fought in the Crimean War and in the Italian campaign of 1859 and in 1862 went to Mexico as military and civil administrator and Minister Plenipotentiary. He promised the Mexicans that their liberties should be preserved and their rights respected, but he sequestered the goods of many who were opposed to Maximilian. Puebla surrendered to him on May 17, 1863, after a long siege, and the city of Mexico was soon occupied, and a provisional government was formed. Forey was accused of too great clericalism. He was replaced by Bazaine, became a marshal in the same year, and soon afterward was given command of a corps d'armée. He retired in 1867, after a stroke of paralysis.

FORFAIT, fôr'fâ', PIERRE ALEXANDRE LAURENT (1752-1807). A French engineer, born at Rouen. In 1773 he was elected a member of the Academy of Rouen, in 1781 became an engineer in the French navy, and in 1787 was intrusted with the construction of packet boats running between France and the French colonies and to the United States. In 1791 he was elected from Seine-Inférieure to the Constituent Assembly. He was charged by Napoleon with the naval preparations for the invasion of Egypt and from 1799 to 1801 was Minister of Marine and the Colonies. Subsequently he was appointed Councilor of State, and inspector general of the fleet designed to be employed in the invasion of England. He was the inventor of the *Seine boat*, wrote many scientific papers, and published a *Traité élémentaire de la nature des vaisseaux* (1788).

FORFANG, or **FOREFANG** (Sax. *fore*, before, and *fangan*, to take). In old English law, the offense of buying up provisions, grain, etc., at a fair or market, before the King's purveyors were served with necessaries for his Majesty. It is denounced in a charter of Henry I in 1133, but has long been obsolete. The term "forfang" was also used in Anglo-Saxon law to describe the lawful recovery, by force and arms, of stolen or strayed cattle from a thief, or from those having illegal possession of them, as well as the reward fixed for such rescue.

FORFAR, fôr'fâr. The county town of Forfarshire, Scotland, a parliamentary and royal burgh situated on the Loch of Forfar, 14 miles north-northeast of Dundee (Map Scotland, F 3). It has a courthouse, county hall with portraits by Raeburn, Romney, and Opie, a public

library, and a public park. The county hall contains a curious relic, a witches' bridle, or gag for use on the way to executions. Linen and jute are its staple manufactures, it also makes leather, rope, and iron castings. Supposed to be the ancient Orreia, it was once the seat of the Scottish kings. David I (1124-53) made it a royal burgh. In 1308 Bruce destroyed the castle, and, according to Boece, Forfar by 1526 had dwindled to "a country village." Since the middle of the eighteenth century it has grown into a prosperous town. Pop., 1901, 12,061, 1911, 12,254. In the neighborhood is Glamis Castle, the seat of the Earl of Strathmore.

FORFARSHIRE, or **ANGUS**. A maritime county in the East-Midland division of Scotland, bounded east by the North Sea, north by Kincardineshire and Aberdeenshire, west by Perthshire, and south by the Firth of Tay (Map Scotland, F 3). Area, 573 square miles. The surface of the county is irregular, and intersected with hills, the Sidlaw being 1400 feet high, and Catlaw, the highest, 2264 feet. The chief rivers are the Tay, North Esk, South Esk, and Isla. Forfarshire is an agricultural county, raises sheep and cattle, and is also the chief seat of Scotch jute and linen manufactures. Capital, Forfar, other important towns are Dundee, Montrose, Arbroath, and Brechin. Pop., 1801, 99,000, 1901, 284,000, 1911, 281,417. Consult Warden, *Angus or Forfarshire* (4 vols., Edinburgh, 1880-83), and A. Jervise, *Memorials of Angus and Mearns* (Edinburgh, 1895).

FORFEITURE. The loss of title to property, as a punishment for crime or other unlawful act. Personal as well as real property is subject to forfeiture, and the penalty may be incurred for civil as well as for criminal offenses. The forfeiture of lands was a penalty of the feudal law and was a direct consequence of the feudal relation of landlord and tenant. This relation was primarily personal and confidential, the lord owing protection to his vassal, and the vassal being bound to the highest degree of loyalty and devotion to his lord. As it was this feudal relation of interdependence which made the vassal a legal person (*homo legalis*)—i.e., a member of society protected by the political organization of the state and its machinery of justice—so the rupture of this feudal relation by any disloyalty operated at once to render the tenant a man without law, a lawless man, or outlaw. As he held his lands, his goods, and even his life on the condition of loyalty to this feudal bond, its breach naturally involved the forfeiture of these.

Forfeiture for Crime. The penalty of forfeiture for treason prevailed in England before the Conquest, as is clear from the fact that lands held in gavelkind, which is a Saxon tenure, may be forfeited for treason. But after the Conquest forfeiture of lands and goods came to be regarded as the peculiar punishment of felony, of which treason against the sovereign was the highest kind, being denominated high treason, to distinguish it from all other felonies, which were called petty treason. In cases of treason the offender forfeits all his lands absolutely to the crown. Upon conviction of felony, according to the old law, the offender forfeited to the crown the profits of all estates of freehold—i.e., life estates—during his life, and all his estates in fee simple for a year and a day, after which they escheated to the lord of whom they were

held. The crown during the year of occupancy was entitled to commit upon the lands what waste (qv) it pleased. By Magna Charta this power of committing waste was restrained, but by 17 Edw II, c 16, the King's right to waste of forfeited lands was again recognized. In all felonies the goods and chattels of the offender are, on conviction, forfeited to the crown, but forfeiture of the goods does not operate until conviction. Where, therefore, a person has disposed of his goods before conviction, the crown cannot reach them. Forfeiture of lands does not take effect until sentence of attainder (qv) has been pronounced. So that a person committing *felo de se* (qv), or a rebel dying before sentence, or killed in open rebellion, does not *ipso facto* forfeit his lands. But sentence of attainder, as soon as pronounced, has a retroactive effect, and annuls all conveyances made between the act of treason or felony and the pronouncing of sentence. Conveyances made before the act of treason are not affected. Hence a wife's jointure is not forfeited, because settled on her before the commission of the act. The same thing is true of the wife's dower in all lands of which her husband was seised prior to the commission of the treasonable acts charged.

Forfeiture for treason and felony is accompanied by *corruption of blood*, whereby the offender is incapable of inheriting any lands or of transmitting any title to an heir. It was this doctrine which produced the escheat of forfeited lands, to which reference has been made above. The tenant, having been cut off by his crime from all human relationships, his blood being corrupted—i.e., bastardized and rendered illegal—by the attainder, has no lawful heirs to whom the lands can descend, and there being thus a failure of heirs, the land escheats to the lord of whom it is held. (See ESCHER) By 7 Anne, c 21, it was enacted that after the death of the Pretender and his sons no attainder for treason should operate to the prejudice of other than the offender himself, but this provision was repealed (39 Geo III, c 93). In 1870, however, the crown's claim of forfeiture was abolished in all cases but outlawry (Forfeiture Act 33 and 34 Vict, c 23, § 1), and in 1879 (42 and 43 Vict, c. 59, § 3) outlawry in civil cases was also abolished.

In the United States conviction of felony has never been attended with forfeiture, and the penalty of forfeiture for treason is confined within narrow limits by the Federal and State constitutions. See ATTAINDER.

Civil Forfeiture. Civil forfeiture may be incurred in England in five ways—viz, by tortious alienation, by wrongful disclaimer, by alienation in mortmain, by breach of condition, and by the commission of waste. The first three of these modes were incidents of the feudal tenure of lands, the last two were introduced by statute. It must be observed that, according to the earliest feudal customs, a gift of lands was always made in favor of a particular person, and that alienation, without consent of the overlord, involved a forfeiture of the fee. But this strictness having by degrees ceased to be observed, forfeiture was only incurred in case of a tortious alienation. Tortious alienation was where the owner of a particular estate conveyed by common-law conveyance, as feoffment, fine, or recovery, a greater estate than that to which he was himself entitled, as where a ten-

ant for life made a feoffment in fee. The immediate effect of this act was the forfeiture of the land to the remainderman or reversioner. By 3 and 4 Wm IV, c 74, abolishing fines and recoveries, and 8 and 9 Vict, c 106, § 4, declaring that feoffment should not have a tortious operation, forfeiture by tortious alienation has ceased to exist. (See FEOFFMENT.) Forfeiture by wrongful disclaimer was where a tenant holding of a superior lord, on being summoned in any court of record, either disclaimed his allegiance or did any act which amounted to a disclaimer. Since, excepting in a few ancient manors, all landowners in England now hold directly of the crown, this form of forfeiture is probably obsolete. Forfeiture by alienation in mortmain is incurred by the conveyance of lands or tenements in favor of any corporation (qv), sole or aggregate, ecclesiastical or temporal. As by vesting the land in a tenant of this description the overlord was deprived of all the duties and services due by his vassal, this act was declared by various acts of Parliament to involve the forfeiture of the lands. (See MORTMAIN.) Forfeiture of copyholds was incurred by committing waste, and by other acts of a wrongful kind inconsistent with the fealty due to the lord. By the Statute of Gloucester (6 Edw I, 1278), the penalty of forfeiture was affixed to the commission of waste by any tenants for life or for years, as well as by guardians in chivalry. (See WASTE.) Forfeiture on breach of condition subsequent is where an estate is held upon a condition contained in the grant itself. On failure of the condition the grantor or his heirs may enter upon the lands. See CONDITION, ENTRY, RIGHT OF.

In Scotland civil forfeiture may arise either from statutory enactment, at common law, or by agreement. By a Statute of 1597 it was enacted that vassals failing to pay their feu duties for two years should forfeit their right. This forfeiture must be established by an action to recover the feu duties in arrear and might be avoided by payment at the bar. At common law a vassal forfeited his land by disclamation or purpresture. The former is analogous to the English disclaimer and consists in the denial by a vassal of his lawful superior. Purpresture was incurred by the vassal's encroachment on the streets, highways, or commonalties belonging to the crown or other superior. These forms of forfeiture have long since fallen into disuse. Forfeiture on special agreement depends wholly upon the terms of the condition inserted in the titles. See FEE, FEUDALISM, IRRITANCY, TENURE.

In the United States civil forfeiture is generally limited to acts of waste committed by tenants for life or years and to the breach of conditions upon which lands are granted, and in a few States even these have been abolished. But there are certain offenses in regard to which particular statutes have been enacted by Congress exacting the forfeiture of property employed as a means of committing the wrongful act or used in an unlawful transaction, but forfeiture in such cases applies only to the particular property designated, and not generally to chattels or lands, as in the other instances which have been maintained. Thus, laws have been passed from time to time providing that smuggling or importation of goods under fraudulent invoices shall cause a forfeiture either of the entire invoice or of the property wrongfully imported. Acts of piracy entail a forfeiture of

the piratical craft and its appurtenances. The same was true of vessels engaged in the slave trade. For forfeitures in war, see PRIZE.

FORGÁCH, or **FORGÁCS**, for'gach. A noble family of Hungary, which traces its origin to the time of King Stephen I.—**FRANCIS FORGÁCH** (1530-75) was Bishop of Grosswarden (1556-67). He took part in the Council of Trent. He afterward traveled to Italy and wrote *Rerum Hungaricarum Sui Temporis Commentarii Libri XXII, 1540-1572*, republished in 1866 by Major in the *Monumenta Hungarica Historica* (vol. xvi). The more recent members of the family include Count **IGNATIUS FORGÁCH** (1702-72), a general of ordnance under Maria Theresa, and Count **ANTON FORGÁCH** (1819-85), who held several offices under Ferdinand and Francis Joseph. From 1861 to 1864 he was High Chancellor and was a staunch supporter of the old Conservative party and bitterly hated by the Nationalists, whose reforms he opposed. After 1860 he was deputy in the Hungarian Diet.

FORGE, FORGING (from *OF forge*, from Lat. *fabrica*, workshop, from *faber*, smith). A forge is a furnace or open fire, commonly fitted with a bellows or air blast, for heating metal which is to be formed into special shapes by forging. Forging is the process of hammering or pressing hot metal into special shapes for use in engineering and the arts. Forges are made in all sizes, from the miniature gas-heating device used by jewelers to the great furnaces for heating steel ingots, armor plates, engine shafts, etc., weighing many tons, and they may be either fixed or portable. Portable forges are usually constructed of metal and are of small size, they comprise a shallow pan or hearth for the fire, a bellows or fan for blowing the fire, and the hand or power mechanism for operating the blast-producing device. Fixed forges are usually built of masonry with an interior lining of fire brick or other refractory material, and the blast is produced by power bellows.

Originally forging was a hammering process solely, but with the advent of larger masses to be treated, and the consequent need for very heavy hammers if the effect of the blow is to reach the centres of such forgings, presses have come into use, especially for making heavy forgings of steel. Forging by hammering may be done either by hand or by power. Hand hammering or forging is usually confined to the production of small forgings or to finishing large forgings produced by power hammers. The process is a simple one and is familiar to any one who has observed a blacksmith fashioning horseshoes or similar small articles. Power forging by hammers is nothing more than the hand-hammering process accomplished by means of heavy hammers operated by steam or other power. (See **HAMMER**.) It is employed in the production of large forgings for engines and machinery. Forging by presses consists in substituting for the power hammer, with its sudden heavy blow, a hydraulic press which squeezes the metal into shape by a comparatively slow, steady pressure. Steel forgings for engine shafts, armor plates, etc., are usually made by pressing. The process may be illustrated by tracing the operations conducted in forging a modern hollow steamship shaft. An ingot of open-hearth steel of proper chemical composition to give the necessary physical properties

is cast approximately twice the size of the finished shaft. The metal is then submitted, while liquid, to hydraulic pressure of 7000 tons, or thereabouts, until cold, great care being taken to cool the ingot slowly and equally on all sides to prevent strains or cracks from forming on account of unequal contraction. When the ingot is cold, the sand from the mold which has adhered to it is cleaned off, and then, if intended for a small shaft, it is ready for the forging process proper. If the shaft is to be of more than 12 or 14 inches in diameter, a hole is bored through the axis of the ingot. The size of this hole varies according to the size of the shaft and the service to which it is to be eventually subjected. Generally speaking, however, it is made from one-third to two-fifths the diameter of the finished shaft. The first operation in the process of forging is the reheating of the ingot. This is a very delicate operation. Great care must be taken to insure a slow and uniform penetration of the metal by the heat, as there is otherwise danger of expanding the surface metal so rapidly that it will crack away from that underneath, which has not been heated to the same temperature. The hole in the centre of large ingots allows the interior and exterior to heat up and expand together, thus relieving this tendency to crack. When the ingot is heated, it is forged into shape under a slow-moving hydraulic press of from 2000 to 5000 tons' capacity instead of the rapid steam hammer of from 5 to 25 tons' falling weight. In the case of the hollow ingot a steel mandrel is inserted, of a size to fit loosely into the hole, and the metal is forged down in the same manner as is employed with a solid shaft. Generally the shaft, if very long, has to be reheated one or more times during the forging. The finishing process consists in annealing or tempering the shaft, when it is ready to be machined.

Many small articles of common use are forged by machinery. Balls, screw and rivet blanks, nuts, nails, etc., are among the more familiar machine-forged articles. In general the process consists in inserting steel bars, heated to the proper temperature and of suitable cross section, into a machine automatically operating, which cuts off the proper lengths and stamps or presses them into shape between dies. The process is a continuous one, one heated rod being inserted after another as fast as the machine will handle them. Many articles of intricate pattern are drop-forged. In this process an upper and a lower die are employed. The lower die is placed on the anvil of a drop hammer, the heated piece of metal placed on it, and the upper die descends on top of the heated metal. A hammer falling from a height carries the upper die and thus stamps the plastic metal into shape between the dies. Drop hammers are made of various sizes, the largest now in operation has a 3000-pound hammer. A very large proportion of the shapes used in the motor vehicle for levers, treadles, connecting rods, and the like are drop-forged. They would once have been either cast and malleableized or hand-forged with entailed cost of manufacture. Shaping or pressing of steel plate in dies is a forging process and is done by heavy power-driven presses. A shaping process carried on without heat is not properly a forging process. See **IRON AND STEEL**.

FORGERY (Fr. *forger*, to form metal into shape, to fabricate). The *crimen falsi* of the

Roman law is held in English common law to be the fraudulent making or altering of a writing or seal, to the prejudice of another man's right, or of a stamp to the prejudice of the revenue. As regards writings, the instrument forged must be executed with such skill or in such circumstances as to be capable of being mistaken for a genuine document by a person of ordinary intelligence and observation. It is not necessary that there should be an attempt at imitation of the handwriting of another or of the form of the simulated document. If there was intention to deceive, and the circumstances were such as to render deception possible, the crime has been committed, and consequently it is possible to forge the name of a person who cannot write. Any material alteration, however slight, is a forgery just as much as the subscription of the name of the pretended maker, or the fabrication of the entire writing. It will not lessen the crime, though the whole writing should be genuine, the name only being forged, or the name being really the handwriting of the party to whom it belongs, but appended to a forged writing. Even if the name be a fictitious one, but appended for the purpose of deceiving, a forgery has been committed. The offense is not limited to the fabrication of writing, using that term in its literal sense. It includes the fabrication of printed or engraved instruments, such as railroad tickets, corporation certificates, bonds, etc. Falsely painting an artist's name on a picture is not forgery, however, for the picture is not a document or writing. Moreover, the document fabricated must have an apparent legal efficacy. A letter of introduction, though requesting a personal favor for the bearer from the one to whom it is addressed, is not a subject of criminal forgery, as it does not purport to confer any legal right or to impose any legal duty. At common law forgery is a felony punishable by fine and imprisonment, or both.

To secure a conviction for forgery it is necessary to prove an intent to defraud, but it is not necessary that the purpose should have been actually effected, it is sufficient to show that the forgery would have proved injurious to another's interests. The different State laws in this country generally define specific offenses as constituting the crime of forgery, but these laws do not materially change the character of the offense at common law, but simply provide a special and increased punishment in such cases as they particularly enumerate. Consult Stephen, *Digest of the Criminal Law* (4th ed., London, 1904), Osborn, *Questioned Documents* (Rochester, 1910), and the bibliography under CRIMINAL LAW.

FORGET, for'gə, AMÉDÉE EMMANUEL (1847–) A Canadian statesman, born at Marieville, Province of Quebec, and educated at Marieville College. Admitted to the bar in 1871, he practiced in Montreal, but later he went West, and became private secretary to the Lieutenant Governor of the Northwest Territories (1876), clerk of the Legislative Assembly, Regina, Saskatchewan (1888), and Assistant Commissioner of Indian Affairs for Manitoba and the Northwest Territories, and in the government of the latter was a member of the Council of Public Instruction (appointed 1893), Indian Commissioner (1895–98), and Lieutenant Governor (1898–1905). In 1905–10 he was Lieutenant Governor of Saskatche-

wan and in 1911 became a member of the Dominion Senate. He was elected vice president of the British Empire League and of the Dominion Forestry Association.

FORGET, SIR JOSEPH DAVID RODOLPHE (1861–) A Canadian capitalist and legislator. He was born at Terrebonne, Province of Quebec, and was educated at Masson College there. He early engaged in business and in 1890 joined the Montreal Stock Exchange, after which he rapidly acquired a fortune and became president of, or a director in, a large number of financial and industrial corporations. In 1908–11 he was chairman of the Montreal Stock Exchange, in 1911 he founded La Banque Internationale du Canada, of which he became president, and he also headed an important merger of Canadian navigation interests. In 1907 he was appointed honorary lieutenant colonel of the Sixty-fifth Carabimiers. Elected (1904) an Independent Conservative member of the House of Commons, in 1911 he declined a seat in the Conservative cabinet of Premier R. L. Borden. In 1912 he was knighted.

FORGET-ME-NOT (*Myosotis*) A genus of annual or biennial herbs of the family Boraginaceae with small, generally blue flowers. The genus is distributed over the temperate zones in all quarters of the world, and a number of species are common in America, growing chiefly in ditches and damp meadows. *Myosotis scorpioides* and the closely related *Myosotis laxa* have crooked, creeping perennial roots, an angular stem 1 to 2 feet in height, and calyx covered with appressed bristles. *Myosotis sylvatica*, with calyx covered with stiff spreading hairs, grows in bushy places and woods and is often planted in flower gardens. It is especially admired for the size and brilliancy of its flowers. The dark-blue forget-me-not of the Azores (*Myosotis azorica*) is cultivated in Europe, but requires the greenhouse. The genus is a favorite with most persons, both because of the brilliancy of the flowers and because it is generally regarded as the emblem of friendship. The English name, scorpion grass, is now seldom heard. The German name, *Vergissmeinnicht*, corresponds with the English, forget-me-not. *Myosotis versicolor*, very common in Great Britain, often as a weed in gardens, and naturalized in the eastern United States, is remarkable for the change of color in the very small flowers, which are first yellow, then blue. Some species occur in such great abundance in parts of Alaska as to color the hillsides. *Myosotis virginica* is rather abundant in dry places of the eastern United States during May and June.

FORK (Fr. *fourchette*, Ital. *forchetta*, AS. *forc*, Lat. *furca*) An instrument with two, three, or four prongs, and a handle, that serves to hold food while it is being cut and also to convey food to the mouth. The common use of individual table forks is European and comparatively modern. The Chinese and the Japanese eat with chopsticks, pencil-shaped objects that they hold in one hand and wield like a pair of tongs. The Greeks and the Romans ate with their fingers, as primitive and half-civilized peoples still do. During the periods of transition from fingers to forks knives were used for eating as well as cutting and still are by the lower classes. But with the development of the wide, flat, four-pronged silver fork, polite society has decided that the fork and spoon alone may be brought to mouth, and the

use of fingers or knives is regarded as inelegant. According to the Italian priest and scholar Peter Damiani, who lived in the eleventh century, individual table forks were first introduced into Venice by a Byzantine princess and from Venice spread through the rest of Italy. In France table forks appear for the first time in an inventory of Charles V dated 1379, and as late as the sixteenth century the court use of forks to eat with was satirized as a novelty. In French and Scottish convents forks were forbidden as sinful. Into England forks are said to have been introduced by Thomas Coryate, who visited Italy in 1608, but as late as the revolution of 1688 few English noblemen owned more than a dozen. At first table forks had only two prongs, later three, and four only towards the end of the seventeenth century. The carving forks used in Italy in the sixteenth century are illustrated and described in a fascinating volume, published in Venice in 1593, entitled *Il Trinciante* (The Carver). Consult Paul La Croix, *Manners, Customs, and Dress during the Middle Ages* (London, 1874), and W. G. Sumner, *Folkways* (New York, 1907). See CUTLERY.

FORK'BEARD (so called from the apparent bifurcation of the ventral fins). A British hake (*Phycis blennoides*), also called hake's dame (q.v.), the ventral fins of which are long and filamentous.

FOR'KEL, JOHANN NIKOLAUS (1749-1818). A German writer on music. He was born at Meeder, Saxe-Coburg, was organist to the University Church in Göttingen, and later director of music at the university. Though he acquired considerable reputation as organist and harpist, his chief interests were the theory and the history of music. Noteworthy are his *Allgemeine Geschichte der Musik* (2 vols., 1788-1801), and *Allgemeine Litteratur der Musik, oder Anleitung zur Kenntniss musikalischer Bücher* (1792), the first bibliographical work of its kind.

FORK'TAIL. A name applied to various birds having noticeably forked tails, as the scissor-tailed flycatcher (see Plate of FLYCATCHERS) or a kite. Specifically it denotes a group of black-and-white insectivorous birds of moderate size, inhabiting mountainous regions from northern India to Borneo, which have long forked tails kept incessantly in motion. They constitute the genus *Hemcirus* and place their nests beside a stone or log, near the edge of small streams.

FORLÌ, fôr-lê' (ancient *Forum Livii*). The capital of the Province of Forlì, in central Italy, on the right bank of the Montone, 40 miles southeast of Bologna (Map Italy, D 2). The town lay on the ancient Æmilian Way (q.v.). In the churches of Santi Biagio e Girolamo and San Mercuriale, named after the first Bishop of Forlì, are the tomb of Barbara Manfredi, paintings by Palmezzano and others and, in the choir stalls, fine wood carving by Alessandro dei Bigni. The imposing cathedral of Santa Croce has been almost entirely rebuilt since 1844, but the dome has fine frescoes of the Assumption by Carlo Cignani. The church of San Mercuriale has an imposing campanile. The collection of paintings in the municipal art gallery contains a fresco by Melozzo da Forlì. The citadel, built in 1361 by Cardinal Albornoz, is now used as a prison. Forlì has a town hall, a lyceum, a seminary, a technical institute, a technical

school, a library, and a hospital (founded in 1636). It markets grain, wine, cattle, silk, and hemp, and manufactures machinery, silk goods, hats, pottery, and furniture. It is the seat of a bishop. The ancient *Forum Livii* is said to have been founded by and named after Livius Salinator, in 207 B.C., after his victory over Hasdrubal in the battle of the Metaurus. (See HASDRUBAL, 3, FOSSOMBRONE.) Early in the Middle Ages it was part of the Exarchate of Ravenna. It changed masters during the struggles of Guelphs and Ghibellines, and was annexed to the Papal States in 1504 by Julius II. Pop. (commune), 1901, 43,708, 1911, 45,994. Melozzo da Forlì, the painter, and Flavio Biondo, the Renaissance topographer, were natives of Forlì. Consult Baedeker, *Central Italy* (15th Eng. ed., Leipzig, 1909).

FORLÌ, MELOZZO DA. See MELOZZO DA FORLÌ.

FORM. 1 For perception of form, see FIGURE. 2 Form of Combination. A proposed rendering of the German *Gestaltqualität*, or quality of form. Some psychologists find it necessary to postulate a form of combination as a distinct mental attribute or content. They say, e.g., that a square is more than four linear extensions, sensibly of the same length, and occupying certain relative positions in the visual field, a square is a square, and squareness is a new character common to all squares, but not to be explained by attention, or by the laws of sensory connection, or by those of imaginal supplementing. A melody, again, is more than rhythm and consonance and scale, a melody is melodic, we recognize its melodic nature as such, the melodic character is something new and unique, common to all melodies, but not found elsewhere. Hence, they argue, "the presentation of a form of synthesis is as distinct from the presentation of the elements combined, considered apart from their union, as the presentation of red is distinct from the presentation of green."

As against this position, two things may be said. 1 It betrays a confusion of the analytic and genetic points of view. The "square" and the "melody" are given as perceptions, the psychological task is, then, to analyze these given perceptions and to formulate the laws under which the elementary processes combine, how these particular processes came to mean "square" and "melody" is another question. Furthermore (2), there are psychologists who on the basis of their own observations are unable to identify the form of combination as a distinct mental attribute or content, and if there are cases where a perception resists analysis, they believe it the better plan to suspend judgment while awaiting more refined methods. Consult Mach, *On Analysis of the Sensations* (Chicago, 1897), Stout, *Analytical Psychology* (London and New York, 1902), Bentley, "The Psychology of Mental Arrangement," in *American Journal of Psychology* (Worcester, 1902); Titchener, *Text-Book of Psychology* (New York, 1910).

FORM (Lat *forma*, shape). In botany, the unit of ecology, as the species is the unit of classification or taxonomy. The term is often used in expressions such as "life form," "plant form," etc. See ECOLOGY, TAXONOMY.

FORM. In music, that element which unites all the various parts into an harmonious whole. It is essential that these various parts should have some intimate relation to one another,

otherwise they would only be loosely strung together and could never represent artistic unity. Musical unity is attained by various means, such as the repetition of musical motives or phrases, the maintaining of a certain rhythm or figuration, the choice of a fixed tonality. Dissonant or contrasting elements are not excluded, but they must be resolved into a higher unity. The germ of all musical form is the two-measure motive, or *section*. A combination of two sections forms a *phrase*, of two phrases a *period*. The first two phrases constitute the *antecedent*, the last two the *consequent*. This is shown by the following example (1) from Beethoven. To this period Beethoven adds another one (2) similarly constructed, and standing to the first in the relation of consequent to antecedent. These two periods together constitute what is known as the simple *Liedform*. Symmetry is one of the most essential features of all musical works, and a composition is unintelligible unless its themes are so arranged that the architectonic structure of the whole presents perfect symmetry. The three fundamental forms are the liedform, sonata form, and rondo form. The grouping of the themes in these forms is

I Liedform A—B—A

II Sonata form [A (key of tonic), B (key of dominant)] — $\frac{A}{B}$ — A—B (in key of tonic)

III Rondo form (a) with two themes A—B—A (in key of B), B (in key of A)—A, (b) with three themes A—B—A—C—A—B—A. The second and third time A appears in keys different from the original.

These forms admit of considerable variety, and the great masters, especially Beethoven and Brahms, have been inexhaustible in ingenious combinations of themes. No definite rules can be laid down in this respect, anything is permissible that does not destroy the symmetry of the whole. In cyclical compositions symmetry between the various movements is maintained by the proportion of the various movements to one another, the relation of their keys, the alternation of slow and fast tempo, and sometimes also the introduction of a theme from a previous movement (Beethoven, Symphony No. 9). See CYCLICAL FORMS.

Instrumental forms were originally developed from simple vocal forms. Their development has been the slow product of centuries. Simple dances were united in the suite (qv), which gradually developed and evolved the sonata. From the stringing together of madrigals arose the original *dramma per musica*, which became the *opera* (qv) and culminated in the *musical drama* (qv). For a careful study of musical forms, consult Lavignac, *Music and Musicians*,

translated from the French by Marchant, with additions by Krehbiel (4th ed., New York, 1903). Consult also E. Pauer, *Musical Forms* (London, 1880), L. Bussler, *Musikalische Formenlehre* (Berlin, 1878), H. Riemann, *Katechismus der Kompositionslehre*, part II (Leipzig, 1904), M. H. Glyn, *Analysis of the Evolution of Musical Forms* (New York, 1909). See CYCLICAL FORMS, FUGUE, LIED, RONDO, SONATA, SYMPHONY.

FORM. In philosophy, a term used by Plato (Gk *idea*, *eidos*) to express the reality of a thing, that which, besides the material of which it is composed, makes it what it is, and which is permanent, in contrast with appearances and objects of sensation that pass away and are altered as they pass. The metaphysical character of Plato's forms, or ideas, has been the subject of much dispute, the question being whether Plato conceived them as having an existence in independence of the world of sense, or whether they were not for Plato very much what laws of nature are for the modern scientist. Aristotle gave the authority of his great name to the former interpretation, which has thus become traditional. Aristotle himself used the word *form* (*eidos*) as expressing the essence of a thing, and thus meaning became current in scholasticism especially in the expression "essential form." Bacon used the word *forms* in the sense of "the laws and modes of action which regulate

and constitute any simple nature, such as heat, light, weight, in all kinds of matter susceptible of them, so that the form of heat and the law of heat, or the form of light and the law of light, are the same thing." But Bacon did not succeed in keeping the term free from scholastic connotation, even in his own use of the word. Kant used the term to designate any principle of arrangement or organization, supplied by the mind to the materials of sense. Kant recognized two perceptual forms, *space* and *time*, and four classes of conceptual forms, which he called categories. In this sense form is subjective, i.e., it is not a characteristic belonging to an object as it exists in independence of experience, but only as it appears in experience. Hegel pointed out the impossibility of thus separating the objective and the subjective.

FORMALDEHYDE, HCHO . A compound of carbon, hydrogen, and oxygen, discovered by A. W. Hofmann in 1867. It is the simplest of the class of aldehydes (qv). It is obtained by the oxidation of wood alcohol. Dry air, saturated with the vapor of wood alcohol, is passed over a superficially oxidized spiral of copper gauze, inclosed in a long glass tube. The products of the reaction—the vapors of formaldehyde and water—pass out of the glass tube into empty receivers, in which the water vapor con-

condenses to liquid water, and the latter dissolves much of the formaldehyde vapor, the result being a 35-per cent solution of formaldehyde in water. Such formaldehyde as passes unabsorbed through these receivers is taken up in water, forming more—this time weaker—aqueous formaldehyde.

Attempts to condense formaldehyde vapor alone, without water, have invariably failed, the isolated compound undergoing chemical transformations with great rapidity. Formaldehyde solutions, known commercially under the name of *formalin*, are used as antiseptics and disinfectants, in the manufacture of certain dyes, etc. Subcutaneous injections of formalin have been proposed as a remedy for septicæmia, but the possible value of the drug is more than counterbalanced by its highly poisonous nature. In this connection it may be interesting to note that, while formaldehyde itself is poisonous, its compound with acid sodium sulphite, $\text{CH}_2(\text{OH})\text{SO}_3\text{Na}$, whose properties resemble to some extent those of formaldehyde itself, is harmless. With ammonia formaldehyde reacts to form a compound known as hexamethylene-tetramine, $(\text{CH}_2)_6\text{N}_4$. This reaction permits of determining analytically the amount of formaldehyde in a given solution. When heated with phenol (carbolic acid), in the presence of a base, formaldehyde enters into reaction, the product being a valuable substance known as *bakelite* (qv), which is used as a substitute for hard rubber, celluloid, horn, amber, ivory, and similar materials. With casein formaldehyde forms a bone-like substance known as *galalith*.

Formaldehyde has formed the starting point in the modern synthetic work on the sugars (qv). If allowed to stand for some time in the presence of weak alkalies, it is transformed into a mixture of simple sugars known as "formose" and including ordinary fructose ("ævulose"). It is probable that in the transformation by plants of atmospheric carbonic acid into complex carbohydrates, such as the sugars and starch, the production of formaldehyde is the first step. Formaldehyde itself has never been found in plants and would probably kill them if produced in considerable quantities. But possibly every trace of formaldehyde undergoes chemical change as soon as formed. See FORMIC ACID. Consult J. E. Orloff, *Formaldehyd* (Leipzig, 1909), and L. Vanino, *Der Formaldehyd* (Vienna, 1901).

FORMALIN. See FORMALDEHYDE.

FORMAN, HARRY BUXTON (1842–). An English author, born in London. He entered the civil service in 1860 and became assistant secretary in the general post office and comptroller of packet services. He is best known as a scholarly and discriminating editor, notably of Shelley (London, 1876–80) and Keats (ib., 1883). His work, editorial and other, also includes *The Letters of Keats to Fanny Brawne* (ib., 1878), *The Shelley Library* (ib., 1886), *E. B. Browning and her Scarcer Books* (ib., 1896), *The Books of William Morris* (ib., 1897), *Letters of Edward John Trelawney* (ib., 1910), *Note Books of Shelley Deciphered* (ib., 1911), *Medwin's Life of Shelley, Enlarged and Fully Commented* (ib., 1913).

FORMAN, JUSTUS MILES (1875–1915). An American author, born at Le Roy, Genesee Co., N. Y. He graduated from Yale University in 1898 and then studied painting for three years in Europe. Besides more than 100 short stories published in the popular magazines, he is author

of *The Garden of Lies* (1902), dramatized in collaboration with Sydney Grundy and played in London in 1904–05, *Journey's End* (1903), *Monsigny* (1904), *Tommy Carteret* (1905), *Buchanan's Wife* (1906), *A Stumbling Block* (1907), *Jason* (1909), *Bianca's Daughter* (1910), *The Unknown Lady* (1911), *The Court of the Angels* (1912), *The Opening Door* (1913), *The Blind Spot* (1914), *The Six Rubies* (1914). He died on the *Lusitania*.

FORMAN, SIMON (1552–1611). A notorious English astiologer and quack doctor. He claimed to have discovered his marvelous powers in 1579 and thereafter practiced as a quack. Strangely enough, he received later (1603) the degree M.D. from Jesus College, Cambridge. At this time he was engaged in a most scandalous practice among the ladies at court, with love philtres and wax images. Besides his *Grounds of the Longitude* (1591), he left behind him a mass of manuscripts, small parts of which have been published, as the *Diary* from 1564 to 1602 (J. O. Halliwell-Phillipps, 1843), and extracts from the *Book of Plays* (Halliwell-Phillipps, Folio Shakespeare, 1853–65), giving the dates of performances at the Globe Theatre of *Macbeth* (April 20, 1610) and *Winter's Tale* (May 15, 1611).

FORMA PAUPERIS, IN (Lat., in the character of a poor person). The phrase usually employed in both England and America when a person arranges to conduct an action in such a way as to avoid certain expenses because too poor to sue in the ordinary way. In England, the statutes 11 Hen. VII, c. 12, and 23 Hen. VIII, c. 15, provide that such as will swear themselves not worth £5 except their wearing apparel and the matter in question in the cause, shall be exempt when plaintiffs, but not when defendants, from the payment of court fees, and shall be entitled to have counsel and attorney assigned to them by the court without fee. They are further excused from costs when unsuccessful, a privilege which, according to Blackstone, amounted in former times only to the rather uncomfortable alternative of choosing between paying and being whipped. In the event of success, however, a person suing in this form is entitled to his costs, because his counsel and agent, and the officers of court, though they are bound to give their labor gratis to him, are not bound to give it on the same terms to his antagonist, unless he too be a pauper. To prevent the abuse of suing in the superior courts at Westminster in this form in matters of small amount, it is provided (19 and 20 Vict., c. 108, § 30), subject to certain exceptions, that any plaintiff who resorts to one of these, in a case falling within the cognizance of a county court, and recovers no more than £20, or in some cases £5, shall have no costs, unless he satisfies the court or a judge that he had sufficient reason for taking that course.

In Scotland this benevolent arrangement was introduced by statute more than half a century before the date of the English act above mentioned.

Similarly, actions *in forma pauperis* may be prosecuted in all of the United States. The provision is deemed a part of the common law of the several States, derived from the English system of administering justice, though it is now in many States governed by statute.

FORMATES See FORMIC ACID.

FORMATION (Lat. *formatio*, from *for-*

mare, to shape, from *forma*, shape) In botany, a widespread assemblage of plants with similar life relations, whose presence is determined by climatic factors—e.g., one may speak of desert formations or tropical evergreen forest formations. A second use of the word applies to an assemblage of similar plant associations or of plant associations in similar habitats, e.g., all the peat-bog associations of a region taken as a whole make up the peat-bog formation of that region, or the associations occurring upon sandstone constitute the sandstone plant formation of the region. The formations first described would be called climatic, in contrast to the more restricted edaphic formations, such as those of the peat bog. See ECOLOGY, DISTRIBUTION OF PLANTS.

FORMATION In geology, a group of strata united by some common characteristic, such as age, origin, or composition. It is loosely employed and may be synonymous with any of the stratigraphic divisions—e.g., coal formation (Carboniferous system), Canadian formation (Canadian series), etc.

FORMA URBS ROMÆ (Lat., shape of the city of Rome). A famous map of Rome engraved on marble and affixed to the outer wall of the so-called Templum Sacræ Urbis (now the church of SS Cosma e Damiano). This map is known also as the Marble Plan or as the Capitoline Plan. Between 1559 and 1565 many pieces of this plan were found at the foot of the wall of the temple and came into the possession of the Farnese family. In 1742 such of these fragments as remained were put in the Capitoline Museum. Other portions were found in 1867 and in 1884, in 1888 over 180 small pieces were found. From 1891 to 1901 about 425 more pieces were discovered. All these pieces are in the Museum. The map represents the plan of the city and some of the suburbs as reconstructed under Severus and Caracalla, after the fire of Commodus, and replaced a previous map made under Vespasian. The fragments have been of great help in identifying existing ruins. Consult Platner, *The Topography and Monuments of Ancient Rome* (2d ed., Boston, 1911), and the references there.

FORMEDON An ancient form of action, in the law of England, belonging to the class of real actions, whereby the heir in tail, or the reversioner or remainderman who had been ousted by a discontinuance, was entitled to vindicate his claim to the lands from which he had been ousted. By 21 Jas I, c 16, it was enacted that writs of formedon should be brought within 20 years after the cause of action arose. The writ of formedon is now abolished, simpler and more convenient forms of action for the recovery of lands having been substituted therefor. It has never been employed in the United States.

FORMENTERA, fôr'mân-tâ'râ. One of the Balearic Islands, in the western part of the Mediterranean (Map Spain, F 3). It is a part of the Spanish Province of Baleares. The island has an area of 38 square miles. Pop., 1900, 2295, 1910, 2600. Wheat is grown, cattle raising, fishing, and salt working are other occupations. Formentera was taken by Aragon in 1232.

FORMER AGE, THE A poem by Chaucer, a metrical version of part of his translation of Boethius. It was discovered by Bradshaw, and published by Morris in 1866.

FORMIÆ, fôr'mê-a (ancient *Formiæ*, later

known as Mola di Gaeta, later still called Formia). A city of the Province of Caserta, in south Italy, beautifully situated on the north shore of the Gulf of Gaeta, 68 miles by rail northwest of Naples. The lower slopes of the mountains that rise behind it are covered with groves of olives, lemons, oranges, and pomegranates. It lay on the ancient Appian Way and once held the summer homes of many wealthy Romans. The entire surrounding country is dotted with the remains of homes and public works of the Romans, who took advantage of the mild climate and the view towards the distant Bay of Naples. The so-called Villa of Cicero, or Villa Caposele, formerly the favorite summer residence of the kings of Naples, contains two well-preserved ancient *nymphaea* of Doric architecture. These remains belong to the first or second century A.D. There is some coasting trade. The town makes pottery and oil. Pop. (commune), 1901, 8108, 1911, 8734.

FORMIÆ See FORMIÆ.

FORMIC ACID (from Lat. *formica* ant), CH_3CO_2 . The simplest and one of the earliest known of the so-called fatty acids of organic chemistry. It derives its name from the circumstance of its having been first obtained from the *Formica rufa*, or red ant, by Rey, in 1670. In a concentrated state it is a fuming liquid with an irritating odor and causes vesication if dropped upon the skin. If pure, it solidifies at moderately low temperatures, forming a crystalline mass that melts at 8.3°C . It boils at a slightly higher temperature than distilled water, yielding a vapor that burns with a blue flame. It is a powerful antiseptic and acts chemically as a reducing agent, e.g., readily reducing the salts of silver, mercury, platinum, and gold. It may be obtained in various ways. For example: (1) by the distillation of red ants with water; (2) by the action of acids or alkalis upon hydrocyanic acid, (3) by the oxidation of various organic substances, such as sugar, starch, wood alcohol, etc., (4) by the action of alkalis upon chloral or chloroform, (5) synthetically (Berthelot), by keeping carbonic oxide gas for a prolonged period in contact with potassium hydroxide at a temperature of 100°C . Kolbe and Schmitt obtained it also by the reduction of carbonic acid—a reaction of great importance, as it suggests a possible explanation of the process by which the transformation of carbonic acid into complex organic substances is effected in the organism of plants, for, since formic acid itself is a very common product of the oxidation of organic bodies, it is easy to conceive how such bodies may be formed in plants by a reversed process—i.e., by the reduction of formic acid and hence of carbonic acid.

The most convenient method of preparing formic acid consists in gradually adding crystallized oxalic acid to anhydrous glycerin at a temperature slightly above 100°C , oxalic acid decomposing into formic and carbonic acids according to the following equation

In the animal organism formic acid occurs not infrequently, either free or in combination, thus, it is found not only in ants, but in the poison of the bee and wasp, and in the hairs of the procession caterpillar. It has also been detected in sweat, in the expressed juice of the spleen.

pancreas, thymus gland, and muscles, in the brain, the blood, and the urine

The salts of formic acid, called *formates*, or *formates*, are crystalline substances, soluble in water, and, if heated above 400° C, readily transformed into salts of oxalic acid. Chemically formic acid is both an acid and an aldehyde, its molecule containing both the acid group COOH and the aldehyde group CHO

Formic acid

and it is to the presence of the latter group in its molecule that formic acid owes its reducing properties. Formic acid is used as a food preservative and in brewing as an antiseptic. In conjunction with certain mordants it is also used as a reducing agent in dyeing. See ALDEHYDES

FORMICATION (Lat. *formicatio*, from *formicare*, to crawl like an ant) A peculiar sensation of partial numbness and tingling of the skin, such as might be produced by the creeping of ants or other small insects over the surface. It is one of the forms of disordered tactile sensation, or paræsthesia, and resembles the awakening from numbness or from a limb being "asleep." It is sometimes a symptom of spinal disease. It may be due to pressure on a nerve or to poisoning by aconite, in the latter case the feeling is experienced in the tongue and cheeks. It is sometimes a symptom of hysteria.

FORMICIDÆ, fôr-mis'î-dê (Neo-Lat. nom. pl., from Lat. *formica*, ant) The ant family, sometimes regarded as a superfamily (Formicoidea.) See ANT, *Social Insects*, under INSECT.

FORMIGÉ fôr'mé'zhâ', JEAN CAMILLE (1845-) A French architect, born at Bouscat (Gironde). He studied architecture under J. C. Laisné and prepared for the government a series of plans and restorations of various public buildings, including the famous Roman Theatre at Orange. In 1885 he became architect of streets and parks at Paris. He constructed the buildings of Liberal Arts and Fine Arts at the Exposition of 1889 and of Rumania at that of 1900. He became an officer of the Legion of Honor and also of the Academy.

FORMOSA A Territory of Argentina, South America, occupying the northeast portion of the Republic, and lying between the rivers Pilcomayo and Bermejo (Map Argentina, H 2). It borders on Paraguay on the northeast and east, the Chaco Territory on the south and west, and the Province of Salta on the northwest. The area is estimated at 41,402 square miles. It is a part of the great Chaco plain, having an elevation of about 350 feet. The surface is level, well watered, and covered with forests. The interior is inhabited by uncivilized Indians and is unexplored. The chief products are sugar cane and tobacco. Pop., 1912, 17,232. The capital is Formosa, on the Paraguay River, with about 6000 inhabitants. The town was founded after General Victorica defeated the natives of the Chaco in 1884-85.

FORMOSA A large and important island of the western Pacific, which formed part of the Empire of China until 1895, when it was ceded to Japan by the treaty concluded at Shimonoseki

(qv) (Map Japan, D 8). With the adjoining group of 47 islands known to foreigners as the Pescadores (qv), ceded by China to Japan by the same treaty, it forms a province of the Japanese Empire under the name of Taiwan.

Topography. Formosa lies off the east coast of China, opposite the Province of Fukien, from which it is distant about 90 miles. It stretches in a general northeast to southwest direction from lat 25° 15' to 20° 56' N, and extends east and west from long 120° to 122° E. Its length is about 235 miles, and its greatest breadth 90 miles, estimated area, 13,841 square miles. Its shape is that of a long oval running to a point known as South Cape. Forty miles east of this lies the island of Botel Tobago, and a little farther north the small island of Samasana. Formosa is regarded by some as a link in the chain of volcanic islands which form the eastern escarpment of a former Malayo-Chinese continent. Along the greater part of the west coast facing China the water is shallow, while on the east coast deep water is found at once.

Throughout almost the entire length of the island, but nearer the east coast than the west, runs a great chain of forest-clad mountains, with peaks ranging from 7000 to nearly 15,000 feet in height. The two highest are Mount Morrison, called Mukang Shang by the Chinese, which the Japanese renamed Nintaka-yama, 14,270 feet, and Mount Sylvia, which they call Setsu-zan, 12,480 feet. East of this massive backbone the country is mountainous, abruptly terminating in a precipitous coast and a few small rocky islands. Some of the cliffs present a sheer descent of from 3000 to 6000 feet. To the west of this mountainous region lies a range of low, barren clay hills, and to the west of this is a broad alluvial plain stretching from north to south, intersected here and there with water channels, terminating in sand banks and long muddy spits, the whole coast presenting a remarkable contrast to the bold rocky face of the east. The land on the west side is regularly gaining on the sea, owing, no doubt, to the sediment brought down from the mountains by the watercourses, especially during the rainy season, when travel in some parts of the interior is rendered almost impossible.

Climate. Except in the north, the climate during the winter is delightful. The excessive rainfall of the north, and especially in the neighborhood of Kelung, makes it unpleasantly cold, though the temperature is generally higher than in the same latitude on the mainland of China. At Tainan the atmosphere is said to be clear and bracing. On the whole, however, the climate is very trying to many. The temperature seldom rises to 100° F, but the general humidity renders even a moderate degree of heat very enervating.

Fauna. As Formosa is included within the "Oriental" zoogeographical region, formed to include the Indo-Chinese coast and the Malayan and Chinese islands, the general characteristics of its fauna will be found under the title ORIENTAL REGION. The island has not been thoroughly explored by naturalists, though Swinhoe and others have done much investigating. Its denizens are largely the same as those of the adjacent mainland, showing that there formerly was a land connection. That the separation occurred comparatively long ago, however, is probable from the fact that the island possesses a goodly number of peculiar species, though very

few, if any, are of a peculiar genus. The main depauperates have been in small forest-keeping birds and such small mammals as moles, flying squirrels, and mice, though a special species of goat antelope or "serow" (*Nemorhædus sumneri*) has been developed in the mountains, and one of a forest deer (*Cervus taevanus*), allied to Chinese and Japanese species, which the natives have half domesticated. The tiger seems never to have reached Formosa, where the largest beast of prey is the beautiful "clouded tiger" (*Felis macroleucis*).

Mining. The interior has been but little explored and little is known of the geology of the island. Gold is found in the streams, but nearly all the gold is obtained from quartz. The output of gold in 1909 was 160,000 momme. Bituminous coal abounds in over two-thirds of the island, and the best-known mines are situated near Kelung and are worked under foreign superintendence. Sulphur is found in great abundance, especially in the north. Petroleum and natural gas are found, but are still undeveloped. Iron is also reported.

Agriculture and Industries. Agriculture is the chief industry and is carried on principally by the Chinese. Camphor, tea, and sugar are the staples, but there are also produced rice, millet, corn, wheat, barley, yams, sweet potatoes, indigo, hemp, jute, peanuts, etc. The forests which cover the mountainous parts are rich in bamboo, camphor, banyan, betel nut, and other trees. The camphor tree, which was formerly looked upon as the most important asset of the island, as it gave to Japan a virtual control of the natural camphor supply of the world, is found principally in the eastern part of the island. The relative importance of this industry has been greatly lessened by the production of synthetic camphor, which has become a rival in the world markets with that produced from the forest growths. Since the monopolization of the camphor industry in 1899, steps have been taken for the elimination of the wasteful methods of production, which under the old régime had threatened the complete exhaustion of the camphor supply of the island. In 1904, 4,685,000 pounds of camphor and 3,712,000 pounds of camphor oil were produced, and in 1912 the output had increased to 7,077,100 and 7,733,922 pounds respectively. Tea is grown chiefly in the northern part and sugar in the southern part of the island. The manufacturing industries are few and confined principally to the production of sugar, camphor, mineral oil, etc.

Commerce and Transportation. Formosa has been open to foreign commerce since the Treaty of Tientsin (1858), which provided for the opening of the four ports of Tainan, Takow, Anping, and Tamsui. There are 15 ports in the island, though most of the imports and exports occur at Tamsui and Kelung. The two safest harbors are those of Kelung, in the north, and Takow, in the southwest. The total value of merchandise exported from the island in 1911 was \$26,500,000 to Japan and \$6,700,000 to other countries, composed principally of tea, sugar, rice, camphor and camphor oil, hemp, jute, etc. The imports of merchandise for the same year amounted to \$17,300,000 from Japan and \$9,897,000 from other countries, and consisted chiefly of fruit products, opium, textiles, metals and metal manufactures, lumber, saki, cigarettes and tobacco, etc. After Japan, the countries sharing most in the trade of Formosa

are China, British India, the United States, and Great Britain. The imports direct from the United States in 1912 amounted to nearly \$1,000,000, and the exports to the United States nearly \$2,500,000. The trade is carried on principally by Chinese and a few European firms, while the commercial influence of Japan is confined to the trade in camphor, opium, and salt—all government monopolies. Nearly all of the trade is carried in Japanese ships. The principal bank of the island, the Bank of Formosa, is a private corporation under government supervision, and has the right of issuing notes, whose circulation, however, is confined to the island. The coin in circulation is that of the Japanese government. The construction of means of transportation and communication is being pushed by the Japanese government with great rapidity. A trunk line, from Takow in the southwestern part of the island to Kelung in the north, has been completed. The total length of railway is now 290 miles, besides 150 miles of light railway. The telegraph system has about 700 miles of line and the telephone system 800 miles.

Government and Finance. The island is under the administration of a military governor-general, who is responsible to the cabinet at Tokyo. He is assisted by a council. The civil Governor, who resides at Taipei, which is called by the Japanese Taihoku, is responsible for the civil administration. Formosa and the Pescadores are divided, for administrative purposes, into seven districts, of which three are known as *kens*, or prefectures of first rank, and the other four as *chos*, or prefectures of the second class. The judicial code of the island is different from that of Japan. The finances are still in an unsatisfactory condition, owing to the unsettled state of the island, which necessitates the maintenance of a large military force. The budget of the colony for 1913-14 estimated the revenue at \$21,940,000, and the expenditure at a like sum. The revenue is derived chiefly from monopolies, customs, and subsidies from Japan. Japanese schools are being established all over the island. In 1910 there were over 20,000 native pupils in Japanese schools.

Population. According to the official estimate of 1913 the population was 3,512,607, besides a temporary population of 20,000. In 1910 the population was 3,341,217. The Japanese number about 50,000. The chief towns are Dai Hoku (95,000), Taiwan City (60,000), Tamsui, and Kelung. In the earthquake of March 17, 1906, 1228 persons were killed and 2329 were injured.

Ethnology. The population consists of three elements: (1) the Japanese, who, apart from the garrisons, are mostly officials, teachers, traders, and fishermen, (2) the aboriginal tribes and clans, and (3) the Chinese settlers, chiefly from the provinces of Fukien and Kwangtung on the mainland. These occupy the plain which borders the west coast, and the regions of the north. The Hakkas (qv) form an important feature of this part of the population. They live in villages of their own and carry on the greater portion of the barter trade with the aborigines. Until comparatively recent times no official was allowed within their inclosures.

So little is known regarding the aboriginal inhabitants of Formosa that the question of their relationship is very obscure. When the early Chinese settlers arrived in Formosa, some

time after the year 1430, they approached it by the west coast, where they found many tribes of savages. Those first encountered they designated Pepohwan, 'Barbarians of the level plain'. These were gradually dispossessed and driven eastward to the low hills which flank the mountains on the west. They have acquired a certain amount of civilization and speak Chinese. The males for the most part dress like the Chinese and in religious matters follow the Chinese, though they still retain many of their original notions and practices. Inheritance is through the mother. By the Chinese they are now designated Sek-hwan, 'cooked,' or 'tamed, barbarians,' as distinguished from the Chi-hwan, 'raw,' or 'untamed, barbarians,' whose habitat is in the mountains beyond and in the south. These are divided into many tribes and clans, with a great variety of languages and dialects, and preserve in their wild independence their ancient customs and institutions—bodily ornaments and mutilations, tattooing, head hunting, spirit and nature worship, etc. They live in villages, have houses of stone roofed with great slabs of slate, and are remarkably neat and clean. Those living on the hillsides build houses of bamboo, grass, and mud. Order prevails everywhere, and in marriage matters they are very strict. Often a large house is provided outside the village where the unmarried men sleep. They cultivate millet and other crops.

History. Chinese records speak of an expedition against Formosa undertaken as early as the year 603. Japanese adventurers are said to have landed and made conquests in it in the twelfth century, and we are told that from the fifteenth century the eastern or aboriginal half was officially considered by the Japanese as a part of their empire. The first Europeans to visit the island were Portuguese. This was in 1590. The Spanish attempted to hold a part of the island, but were driven out by the Dutch, who had gained a footing in the Pescadores in 1621. In 1624 the Dutch occupied a point near Taiwan, where they built a fort and a town which they called Zeelandia, began commercial operations on a great scale, opened schools, and inaugurated mission work. When in 1620 the persecution of native Christians broke out in Japan, large numbers of them fled to Formosa and formed a colony, but later dwelt with the Dutch until the latter were forced in 1662 to withdraw, as the result of many conflicts with the Chinese settlers and with Koxinga (q v), the famous pirate, who succeeded in making himself King of the island. After a brief and stormy reign his successor was dethroned by the Manchu emperors. The opening in 1858 of Formosa to foreigners was an important event in the history of the island. Roman Catholic missions were established in 1859, Protestant missions in 1860, and by 1864 a prosperous foreign trade had been established. The aborigines, however, continued to give trouble. As the result of the murder of a number of Japanese sailors by the natives, China was appealed to for redress, but disclaimed responsibility for the acts of the savages. In 1874 the Mikado sent a punitive expedition under General Saigo. On the protest of the Peking government, however, the Japanese retired, but only on conditions secured in Peking by the Japanese envoy—Soyeshima (q v)—that China should reclaim and govern east Formosa and pay the expense incurred by Japan. In 1884 Kelung was taken

by the French under Admiral Courbet and held until June, 1885.

One result of the Chino-Japanese war over Korea, in 1894-95, as specified in the Treaty of Shimonoseki (q v), was the cession of Formosa to the Mikado's officers, June 2, 1895. The Chinese officials on the island, summoning the Black Flag General Liu to their aid, declared a 'republic.' Forthwith the Japanese Imperial guard of 7000 men was dispatched, the rebellious republic was duly crushed, and the natives were chastised. Then began the costly occupation and development. Outbreaks have been frequent, but order is being rapidly evolved from the complicated conditions of races and interests.

Bibliography. This is extensive, but it may be simplified by consulting Henri Cordier's *Bibliographie des ouvrages relatifs à l'île Formose* (Paris, 1903). The works of the early annalists contain much that is both useful and curious. See Imbault-Huart, *L'île Formose* (Paris, 1893). For those who can read French, this is an excellent work to refer to. Other general works on Formosa are Campbell, *Missionary Success in Formosa* (London, 1889), Mackay, *From Far Formosa The Island, its People and Missions* (New York, 1896), *Geschichte Formosa bis Anfang 1898* (Bonn, 1898), Swinhoe, *Notes on the Island of Formosa* (1863).—Mr Swinhoe was a naturalist, Le Gendre, "Account of a Visit to the Southern Tribes," in *United States Commercial Relations for 1868-69*, House, *The Japanese Expedition to Formosa* (Tokyo, 1875). The astonishing literary imposture may also be consulted Balmanazar, *Description of Formosa* (London, 1705). Davidson, *The Island of Formosa* (1902), Y Takekoshi, *Japanese Rule in Formosa*, trans by G Braithwaite (London, 1907), and Terry, *The Japanese Empire, including Korea and Formosa* (Boston, 1914), are the most recent works on the subject.

FORMO'SAN DEER. A species of deer (*Cervus taivanus*) peculiar to the mountains of Formosa, and frequently caught in traps by the people and tamed as a pet. It is one of the "sika" group, which includes the spotted deer of Japan and others of Manchuria. It is lighter in color than the others, while the spots have a tendency to persist during winter, and the tail is white with a black stripe down the middle of its upper side. See SIKAs.

FORMO'SUS. Pope, 891-896. He was born about 816, probably in Rome, and first appears in history as Cardinal Bishop of Porto (864), he was sent on an embassy to the Bulgarians by Nicholas I in 866 and trusted with important missions by Adrian II. His period was one of strife between the factions which drove on the disruption of the Empire of Charlemagne. Having sided with the German faction against John VIII, he was excommunicated and banished, but on taking an oath never to return to Rome or again to assume his episcopal functions, he was readmitted as a layman to the rites of the church (878). From this oath he was absolved by Marinus, the successor of John VIII, and restored to his dignities (883), and on the death of Stephen VI, in 891, he was chosen Pope. The Italian faction had chosen Sergius; and the election of Formosus, which was in opposition to an old rule against the translation of bishops from one see to another, could not be confirmed without violence, but he was rendered secure for a time by the success of the arms of Arnulf of

Germany After the withdrawal of Arnulf Formosus was compelled to grant the Imperial crown to Lambert, son of Guido of Spoleto, but this act did not pacify the Italian faction, and Formosus was released from very hard straits only by the arrival of Arnulf, who captured Rome in the end of 895. In the following year Arnulf was crowned Emperor by Formosus, who died soon after. His successor, Stephen VII, had his body disinterred and treated with contumely as that of a usurper of the papal throne, but Theodorus II, in 897, restored it to Christian burial, and at a synod presided over by John IX, in 898, the pontificate of Formosus was declared valid and all his acts confirmed. Consult A E McKilliam, *Chronicle of the Popes from St Peter to Pius X* (London, 1912).

FORMS, or QUANTICS. In mathematics, rational, algebraic, integral, homogeneous functions of r variables, $x_1, x_2, x_3, \dots, x_r$, the degree of these variables being the order of the form. If $r = 2$ there results a binary form, if $r = 3$, a ternary, etc., terms due to Gauss (1801). Symbolically a binary form may conveniently be

represented by $f(x_1, x_2) = \sum_{r=0}^n \binom{n}{r} a_r x_1^{n-r} x_2^r$

With algebraic forms is connected the study of invariants and covariants, the whole subject being sometimes called, by the English, the theory of quantics, or modern higher algebra. The theory was first extensively investigated by Gauss (q v), although Lagrange had already studied the invariant property of the discriminant (Sylvester, 1852, Gauss had called it the determinant, 1801) $a_0 a_2 = a_1^2$, of the quadratic form $a_0 x^2 + 2a_1 xy + a_2 y^2$, finding, viz, that it is unaltered by substituting $x + \lambda y$ for x . To Boole (1841) is due the discovery of the invariant property of the discriminant of every binary form. Eisenstein, Hesse, Aronhold, and Clebsch in Germany, Cayley and Sylvester in England, and Brioschi in Italy, have been among the most prolific contributors to the theory. The best historic survey is that of Franz Meyer, "Bericht über den gegenwertigen Stand der Invariantentheorie," in *Jahresbericht der deutschen Mathematiker-Vereinigung*, vol 1 (Berlin, 1892). The most important treatises upon the subject are Cayley's "Memoirs upon Quantics," in the *Philosophical Transactions* (London, 1854 et seq); Salmon, *Modern Higher Algebra* (Dublin, 1859, and enlarged later editions), Fiedler, *Die Elemente der neueren Geometrie unter der Algebra der binären Formen* (Leipzig, 1862), Clebsch, *Binäre Formen* (ib, 1872), Faà di Bruno, *Formes binaires* (Turin, 1876, Leipzig, 1881), Gordan, *Invariantentheorie* (ib, 1887), Elliot, *Algebra of Quantics* (2d ed, Oxford, 1913). An important digest of the theory, with bibliography and historical notes, is Meyer, "Invariantentheorie," in the *Encyclopadie der mathematischen Wissenschaften*, vol 1 (Leipzig, 1899).

FORMS OF ACTION. The approved classes into which actions are divided under the common-law system of pleading and practice. They had their origin in the use of original writs, which were mandatory letters or processes issuing in the King's name, containing a statement of the alleged injury, and directing the sheriff to first command the defendant to satisfy the claim, and, on his failure to do so, to summon him into court to answer and defend the com-

plaint made against him. Many of these writs were of remote antiquity, some of them antedating the Conquest, and others being shaped by the clerks and judicial officers of the Norman kings. They were drafted in fixed and certain forms, providing remedies for the more ordinary and obvious civil wrongs. These writs were limited in number, and where an injured person could not make the facts of his case fit the allegations of a known writ, he was wholly without remedy, as there was no other way in which he could get his cause before the court. Thus they had the effect of limiting and defining the right of action itself, and for this reason the enumeration of writs and causes of action became identical. This condition of affairs was somewhat relieved by the introduction of curious and arbitrary legal fictions, whereby an old writ was made to do service for a new cause of action. Thus, there being no form of action for the recovery of goods unlawfully detained by a tortfeasor, the action in trover, originally devised to permit the recovery of lost goods from the finder, was without change of form made available for the more general purpose. For example, if A, having B's goods in his possession, wrongfully withheld them from B, the writ would allege that B had casually lost the goods and A had found them, but, although knowing them to be the goods of B, had refused to deliver them to him. B was not required to prove this fictitious allegation, but could show the true circumstances, which might be that he had given A the goods to store for him, to be returned on demand, and that A had converted them to his own use.

A further important modification of the ancient forms of action was effected by a statute enacted in the reign of Edward I, which provided that where the facts of a new case were similar to those covered by a known writ, the clerks of Chancery should have power to frame a new writ to meet the exigencies of the case. This caused an increase in the number of writs, and consequently in forms of action, the new forms being known as actions on the case, i.e., actions in similar cases (*in consimili casu*), and contributed very greatly to making the common-law system more efficient in the administration of justice. Notwithstanding these changes, forms of action have always tended to become inflexible and insufficient for the relief of many civil wrongs, and this inflexibility has been a potent cause of the growth of equity jurisdiction.

The following were the principal forms of action at common law. Assumpsit, Covenant, Debt, Account, Trespass, Trover, Case, Detinue, Replevin, Ejectment, and Writ of Entry. They have been abolished in England by the Judicature Acts (q v), and in several of the United States have been superseded by modern forms of action instituted by codes of procedure, but they are still in use with some changes and modifications in some jurisdictions. See ACTION, COMMON COUNTS, COMMON FORMS, PLEADING, PRACTICE.

FORMS OF ADDRESS. In those countries where gradations of rank and title prevail there is great complexity in the forms of address. As those which are most often practically useful, the ceremonious modes of addressing letters to titled personages in England are given in the accompanying table. It must be understood that in nearly all cases these forms are employed only where strict formality is requisite, as from com-

plete or comparative strangers. In informal conversation it is nowhere the custom of persons of good social position to use the strict forms here given unless there are personal or professional reasons for it. Thus, e.g., a very young man of good manners, speaking to an aged and distinguished peer, or a clergyman to his bishop, may call him "My Lord", but the King or the Prince of Wales is usually addressed by persons with whom he is acquainted simply as "Sir," the Queen as "Ma'am," a duke as "Duke," other peers and their wives as "Lord ——" and "Lady ——".

Forms of address in the United States are not so rigidly governed by custom as in the older or

Archbishops "The Most Rev the Archbishop of ——" (If a cardinal, "His Eminence the Cardinal Archbishop of ——")

Bishops in the Roman Catholic or Episcopal churches "The Right Rev the Bishop of ——" or "The Right Rev ——" The Presiding Bishop in the Episcopal church, "The Most Rev," etc., dean of cathedrals, "The Very Rev," etc., and archdeacons of dioceses as "Venerable," usually shortened to "Ven." In the Methodist church, "The Rev Bishop ——".

The use of the term "Esquire" was at one time largely confined in America to addressing lawyers, but more recently the English practice which attributes it to any gentleman of position

PERSONAGE	Address of letter to	Beginning of letter to and reference to
Archbishop	His Grace the Lord Archbishop of —	My Lord Archbishop, your Grace.
Baron	The Right Hon Lord —	My Lord, your Lordship
Baron's son	The Hon John —	Sir
Baron's daughter	The Hon Mary —	Madam
Baronet	(If married, the Hon Mrs —)	
Baronet's wife	Sir John —, Bart	Sir
Bishop	Lady —	Madam
Countess	The Right Rev the Lord Bishop of —, or simply, The Lord Bishop of —	My Lord, your Lordship
Daughter of Duke, Marquis, Earl	The Right Hon the Countess of —	Madam, your Ladyship
Duchess	The Lady Mary —	Madam, your Ladyship
Duke	Her Grace the Duchess of —	Madam, your Grace
Earl	His Grace the Duke of —	My Lord Duke, your Grace
Eldest son of Duke, Marquis, Earl	The Right Hon the Earl of —	My Lord, your Lordship
King	Uses the second title of his family, and is by courtesy addressed as though he held the title by law	
Knight	His [Most Gracious] Majesty the King	Sire, your Majesty.
Knight's wife	Sir John —	Sir
Lord Lieutenant (of Ireland)	(If a knight commander of any order, its initials follow name, as K C B, K C S I)	
Lord Mayor*	Like baronet's wife	
Maid of Honor	His Excellency the Lord Lieutenant	According to rank
Marchioness	The Right Hon the Lord Mayor	My Lord, your Lordship
Marquis	The Hon Mary S —	Madam
Members of Parliament	The Most Hon the Marchioness of —	Madam, your Ladyship
Officers in the Army and Navy	The Most Hon the Marquis of —	My Lord, your Lordship
Prince	The letters M P are added to their usual address	
Princess	Their rank in the service, if above subaltern, is prefixed to any other rank	
Privy Councillor	His Royal Highness the Prince of —, or Prince —, or (if the prince is a duke) His Royal Highness the Duke of —	Sir, your Royal Highness
Queen	Her Royal Highness the Princess of —, or the Princess —, or the Duchess of —	Madam, your Royal Highness.
Viscount	The Right Hon —	
Viscountess	Her Majesty the Queen	Madam, your Majesty
Younger sons of Duke or Marquis	The Right Hon Viscount —	My Lord, your Lordship
Younger sons of Earl or Viscount	The Right Hon Viscountess —	Madam, your Ladyship
	The Lord John —	My Lord, your Lordship
	The Hon —	Sir

*The title "Lord Mayor" is confined to the chief magistrate of the city of London and a few of the larger cities—until recently York and Dublin alone

monarchical countries, but common usage has sanctioned the following forms

The President of the United States is addressed simply as "The President of the United States"

Governors of States and ambassadors and ministers to foreign countries are addressed as "His Excellency" (the Ambassador from Great Britain)

The Vice President, heads of executive departments at Washington, justices of Supreme or Superior courts, lieutenant governors of States, mayors of cities, etc., "The Hon ——" (Vice President of the United States, etc.)

Senators and Representatives of the United States, or of the several States, "The Hon ——" to which may be added their official designation

Ex-presidents or other former officials of the above-mentioned ranks are commonly addressed as "The Hon ——".

not possessing another title has been gaining ground, although "Mr ——" is still a common usage

PHAEL, SEBASTIANO DEL PIOMBO

FORNEY, JOHN WEISS (1817-81). An American journalist and politician. He was born at Lancaster, Pa., and at the age of 16 entered the printing office of the *Lancaster Journal*. Four years later he purchased the *Lancaster Intelligencer*, and in 1840 he became proprietor of the *Journal* and combined the two papers under the name of the *Intelligencer and Journal*. In 1845 President Polk appointed him deputy surveyor of the port of Philadelphia, where he purchased a half interest in the *Pennsylvania*, a Democratic paper of great influence, which under his editorial control attained a

national importance In 1851-55 he was clerk of the United States House of Representatives, and he edited the *Union*, the organ of the Northern Democrats He conducted Buchanan's successful campaign for the presidency, and Buchanan would have given him a cabinet office if the appointment had been more popular in the South Buchanan's influence was not strong enough to win Forney a seat in the United States Senate, which went instead to Simon Cameron (qv) In August, 1857, Forney established the *Philadelphia Press* At first a Douglas Democrat, he became, in the latter days of the Buchanan administration, a Republican and contributed to the organization of that party and its early successes In 1859-61 he was a second time clerk of the House, and he published in Washington the *Sunday Morning Chronicle*, which in 1862 was changed to a daily, and was throughout the Civil War looked upon as the organ of the Lincoln administration After serving as secretary of the United States Senate from 1861 to 1868, he disposed of his interest in the *Chronicle* and returned to Philadelphia, where in 1871 he was made collector of the port by President Grant He was an earnest promoter of the Centennial Exposition and visited Europe in its interest in 1875 In 1877 he sold the *Press* and established a weekly, the *Progress*, which he edited until his death In 1880 he left the Republican party and supported Hancock for the presidency He published *Letters from Europe* (1869), *What I Saw in Texas* (1872), *Anecdotes of Public Men* (2 vols., 1873), *Forty Years of American Journalism* (1877), *The New Nobility* (1881) Consult McClure, *Old Time Notes of Pennsylvania* (Philadelphia, 1905)

FORNICATION (*fornicatio*, from *fornix*, an arch vault, and by metonymy a brothel, because brothels in Rome were in cellars and vaults under ground) The illicit carnal intercourse by an unmarried person with one of the opposite sex, whether married or unmarried In most countries this offense has been brought within the pale of positive law at some period of their history, and prohibited by the imposition of penalties more or less severe, but it is now usually left to the restraints which public opinion imposes on it in every community which is guided by the principles of morality and religion In England, in 1650, during the ascendancy of the Puritan party, the repeated act of keeping a brothel or committing fornication was made felony without benefit of clergy on a second conviction At the Restoration this enactment was not renewed, and though notorious and open lewdness, when carried to the extent of exciting public scandal, continued, as it had been before, an indictable offense at common law, the mere act of fornication itself was abandoned "to the feeble coercion of the spiritual court" In a few of the United States the offense is made a misdemeanor by statute, punishable by fine and imprisonment, but in most of the States it is ignored as at common law Consult the authorities referred to under CRIMINAL LAW

FORO APPIO See FORUM APPII

FORER, fō'rā', LUDWIG (1845-1921). A Swiss statesman, born in Islikon, near Winterthur, and educated at the University of Zurich He was in the department of police and then was cantonal attorney of Zurich, and in 1873 began to practice law in Winterthur He went into

politics, became president of the Nationalrat in 1891, director of the central office for railways in 1900, and a member of the Bundesrat in 1902 and leader in it of the Radical party In 1906 and 1912 he was President of the Swiss Confederation

FOR'REST, DAVID WILLIAM (?—) A Scottish clergyman, born in Glasgow He was educated at Glasgow and Leipzig universities and the United Presbyterian College, Edinburgh, was pastor of Saffronhall Church, Hamilton (1882-87), the United Presbyterian Church of Moffat (1887-94), the Wellington Church, Glasgow (1894-99), and the United Free Church, Skelmorlie, Wemyss Bay (1899-1903), and in 1903 became minister of the Edinburgh North Morningside United Free Church He was Kerr lecturer at Edinburgh in 1897, publishing his lectures under the title *The Christ of History and of Experience* (1897, 6th ed., 1908), and was special lecturer at Yale University in 1901 He wrote *The Authority of Christ* (1906) and was joint editor of *The Letters of Dr John Brown* (1907)

FOR'REST, EDWIN (1806-72). An American tragedian, long the most famous that our stage had produced He was born in Philadelphia, March 9, 1806, of Scottish and German descent Already he had attracted attention in amateur theatricals when, Nov 27, 1820, he made his first regular appearance at the Walnut Street Theatre, in Philadelphia, in Home's *Douglas* By diligence and close study he rose in the profession and in 1826, at the Park Theatre, New York, made a decided triumph in *Othello* Henceforward his career was one of distinction, both in this country and in England, where he made his first appearance at Drury Lane in *The Gladiator* in 1836 There in 1837 he married Catharine, the daughter of John Sinclair, the singer In later years he became jealous of her, and the trial by which, in 1852, she obtained a divorce was one of the most celebrated cases of the time His quarrel with Macready, whom he hissed from a private box in Edinburgh, was another affair which did him little honor Much of the odium that has been cast upon him for the Astor Place Riot in New York (1849), which was ostensibly in favor of Forrest against his English rival, was certainly undeserved, for that unfortunate outbreak was really one of the episodes of the native American movement of this period, but Forrest's relation to the matter was far from dignified Though he lost the favor of many of the best people, his success upon the stage was, nevertheless, uninterrupted He had already made a fortune and built a castle on the Hudson, called Fonthill, later he established himself in a home in Philadelphia His last professional appearance was in 1871 He died Dec 12, 1872, from apoplexy, after an illness of half an hour In his will he left a large portion of his ample estate to found a home for aged and destitute players

Forrest has been called essentially a melodramatic actor His robust physique and voice made the assumption of sentimental parts almost impossible In Shakespeare his best rôles were Richard III, Lear, Coriolanus, and Othello, but he was even more effective in Virginius, Metamora, Spartacus, Damon, and characters of that range His personal disposition was impetuous and frank, though marred at times by jealousy and an excessive opinion of his own merits He was an arduous student of his pro-

fession and gathered a splendid library, in which the Shakespearean collection was famous. Consult Bariett, *Edwin Forrest* (Boston, 1882), Alger, *Life of Edwin Forrest, the American Tragedian* (Philadelphia, 1877), Rees, *The Life of Edwin Forrest, with Reminiscences and Personal Recollections* (ib, 1874), Winter, *Other Days* (New York, 1908), id, *The Wallet of Time* (2 vols, ib, 1913).

FORREST, FRENCH (1796-1866). An American naval officer, born in Maryland. He distinguished himself as a midshipman in the War of 1812 and was present at the battle of Lake Erie. In 1817 he became a lieutenant, in 1837 commander, and in 1844 captain. During the Mexican War he was adjutant general. He joined the Confederates at the outbreak of the Civil War, was appointed to the command of the navy yard at Norfolk, and became Acting Assistant Secretary of the Confederate navy.

FORREST, SIR GEORGE WILLIAM (1846-1926). A British administrator and historian of India. He was born in Nasirabad, the son of an English captain, and was educated at St John's College, Cambridge. In 1872 he was appointed to the Bombay Educational Department, in 1882 was census commissioner in Bombay, became professor of English history at Elphinstone College in 1887 and director of records for Bombay in 1888, and was knighted in 1913. He edited valuable *Selections* from the Bombay State Papers, especially on the Indian Mutiny (1897), and wrote *The Administration of Warren Hastings* (1892), *The Administration of the Marquis of Lansdowne* (1894), *History of the Indian Mutiny* (1904-12), *Life of Field-Marshal Sir Neville Chamberlain* (1909).

FORREST, SIR JOHN (1847-1918). An Australian explorer and politician, born near Bunbury, in Western Australia. He entered the survey department of that colony in 1865, in 1869 commanded an expedition to the interior to trace Dr Leichhardt, and in 1870 led an exploring expedition from Perth to Adelaide. In 1874 he commanded a second exploring expedition, from Champion Bay on the west coast to the overland telegraph line between Port Darwin and Adelaide, a distance of about 2000 miles. He was appointed Deputy Surveyor-General of Western Australia in 1876, and Commissioner for Crown Lands and Surveyor-General in 1883. From 1890 to 1901 he served as first Premier and Treasurer of Western Australia. In 1901 he became Postmaster-General in the first cabinet of the Australian Commonwealth, but in the same year was transferred to the Ministry of Defense, which he held till 1903, was Home Minister till 1904, and Postmaster-General again in that year. He was Treasurer in the Deakin cabinet in 1905-07. He was knighted in 1891. His publications include *Explorations in Australia* (1876), and *Notes on Western Australia* (1884-87).

FORREST, NATHAN BEDFORD (1821-77). An American cavalry leader on the Confederate side during the Civil War. He was born near Chapel Hill, Tenn., on July 13, 1821, removed with his father, a blacksmith, to Tippah Co, Miss, in 1834, attended school for only about six months altogether, joined an uncle in the horse and cattle trading business at Hernando, Miss, in 1842, later became a slave trader at Memphis, Tenn., and by 1859, when he became a cotton planter in Mississippi, had accumulated a fortune. Though at first opposed to a dissolution

of the Union, he entered the Confederate army as a private in June, 1861, and in July was called upon by Governor Harris of Tennessee to organize a battalion of cavalry, of which, in October, he became lieutenant colonel. Soon afterward he was ordered to Fort Donelson, where he remained until Grant's attack, and with Floyd and the cavalry escaped on the night of Feb 15-16, 1862, leaving Buckner to surrender on the 17th. (See FORT HENRY AND FORT DONELSON.) On July 21, 1862, he was promoted to be brigadier general and thereafter served in Kentucky for some time under General Bragg. He was transferred to northern Mississippi in November, 1863, was promoted to be major general on December 4 of that year, and in November of the following year was placed in command of all the cavalry with the Army of Tennessee. On Jan 24, 1865, he was placed in command of the cavalry in Alabama, Mississippi, and east Louisiana, on February 28 became a lieutenant general, in March was defeated at Selma, Ala., by Gen J H Wilson, and in May surrendered at Gainesville, his troops being included in the arrangement made by Gen Richard Taylor with General Canby. In the North he became unfavorably known as the leader of the Confederates at the so-called "massacre of Fort Pillow," though he uniformly denied the charges that were brought against him. (See FORT PILLOW.) After the war he worked his plantation for a time, was president from 1868 to 1874 of a company which endeavored without success to build a railroad between Memphis and Selma, and subsequently until his death conducted two large plantations, one on President's Island and the other in Shelby Co, Tenn. During part of the Reconstruction period he is said to have been at the head of the Ku-Klux Klan (qv). Forrest was 6 feet, 2 inches tall and weighed 185 pounds. A born soldier, he suffered not a little from his lack of education. A fine equestrian monument to him by Niehaus was unveiled in Forrest Park, Memphis, Tenn., in 1905. Consult Jordan and Pryor, *Campaigns of Nathan B Forrest* (New York, 1868), Wyeth, *Life of General Nathan Bedford Forrest* (ib, 1899), Mathes, *General Forrest* (ib, 1902), one of the "Great Commanders Series."

FORREST CITY. A city and the county seat of St Francis Co, Ark, 90 miles (direct) east by north of Little Rock, on the St Louis, Iron Mountain, and Southern and the Chicago, Rock Island, and Pacific railroads (Map Arkansas, E 2). The city contains the Crowley Ridge Institute and a courthouse. It is the centre of a fertile agricultural and stock-raising district, and manufactures spokes, cottonseed oil, lumber, cotton, veneer, ice, bottling-work products, etc. The water works, sewage system, and electric-light plant are owned and operated by the city. Pop, 1900, 1361, 1910, 2484.

FORRESTER, ALFRED HENRY (1804-72). An English artist, whose pen name was ALFRED CROWQUILL. He was born in London. At the age of 20 he began to contribute to various periodicals and afterward practiced drawing and modeling, wood and steel engraving. He contributed sketches to *Punch*, the *Illustrated London News*, other periodicals, and several annuals, and illustrated many books, six of which he wrote himself. *Phantasmagoria of Fun* (1843) is representative of his best work, and some of his other publications are *A Bundle of Crowquills* (1854); *The Comic Arithmetic*

(1844), *The Book of Ballads* (1849, with Doyle and Leech). His elder brother, CHARLES ROBERT (1803-50), also employed the name of Alfred Crowquill. Charles was for a time on the staff of the *New Monthly Magazine* and *Bentley's Miscellany*. He was the author of several novels and tales.

FORRESTER, CHARLES ROBERT See FORRESTER, ALFRED HENRY

FORRESTER, FANNY The pseudonym of Miss Emily Chubbuck, who became the wife of Adoniram Judson, the American missionary. See JUDSON, ADONIRAM

FORSBERG, förs'bër-y', Nils (1842-). A Swedish historical and portrait painter. He was born at Riseberga, Skåne, the son of a peasant, and was apprenticed to a house painter at Göteborg. A statue of Minerva which he modeled having procured for him a government stipend, in 1867 he went to Paris, where he studied painting under Bonnat. The siege of Paris, during which he enlisted in the Ambulance Department, afforded him opportunities for studying and sketching the stirring scenes that came under his observation. In 1877 he exhibited "An Acrobat Family," now in the Museum at Göteborg, which contains nude figures of great energy and virility. "The Hero's Death" (1888), for which he was awarded the great gold medal at the Paris Salon, now in the National Museum at Stockholm, is an attempt to reconcile the traditional historical picture with modern painting. Afterward he devoted himself more especially to historical subjects, and still later to portraits. He received a gold medal at the Paris Exhibition of 1900 and was made Chevalier of the Legion of Honor in 1901.

FORSETE, för-sët'e, or FORSETI, för-sët'e (Icel, Fore-seated). The son of Balder, and the god of Justice, in Norse mythology.

FORSHEY, CALEB GOLDSMITH (1812-81). An American engineer, born in Somerset Co., Pa. He was educated at Kenyon College, Ohio, and at West Point, but left the latter institution in 1836 before graduating and became professor of mathematics and civil engineering at Jefferson College, Miss. He was engaged in engineering work in the Southwestern States for several years, was engineer in charge of the government survey of the Mississippi River delta from 1851 to 1853, and from 1853 to 1855 was chief engineer of the Galveston, Houston, and Henderson Railroad. In 1855 he established the Texas Military Institute and served as its principal until 1861, when, on the outbreak of the Civil War, he joined Sam Houston in actively opposing the Secession movement in Texas. After the secession of the State, however, he offered his services to the Confederacy and was commissioned a lieutenant colonel of engineers, in which capacity he performed valuable services both in Virginia, where he served on the staff of General Magruder, and in Texas. After the war he engaged in railway engineering and in work on the Mississippi River and its branches. He was one of the authors of *The Physics of the Mississippi River* (1861, new ed., 1876).

FORSKÅL, för'skal, PETER (1736-63). A Swedish botanist. He was born in Kalmar, studied at Göttingen, and was professor at Copenhagen. In 1761 he took part in a scientific expedition to Egypt and Yemen, where he collected several hundred plants which had previously been unknown. Seized with an attack

of the plague, he died on his journey in Arabia. Among his publications are *Dubia de Principis Philosophiæ Recentioris* (1756), *Descriptiones Animalium, Arum, Amphibiorum, Piscium, Insectorum, Vermium quæ in Itinere Orientali Observavit Petrus Forskal* (1775), *Flora Ægyptiaco-Arabica* (1775). The genus *Forskalia* is named in his honor.

FORSSELL, förs-sël', HANS LUDVIG (1843-1901). A Swedish historian, editor, and statesman, born at Gefle. He was educated at the University of Upsala, where he became an instructor in 1866. In 1875-80 he was Finance Minister and from 1888 President of the Exchequer. From 1879 to 1897 he was a member of the Upper House of the Riksdag. He largely assisted in the establishment of the gold standard for Swedish currency, and wrote *Studier och Kritiker* (1875-88), collections of essays, *Sveriges inre historia från Gustaf I* (1869-75), *Anteckningar ur Sveriges jordbruksnärings i 16 sekel* (1884).

FORST, först A town in Brandenburg, Prussia, on the Neisse, 44 miles south of Frankfort-on-the-Oder (Map Prussia, F 3). Its chief industry is weaving cloth, in which 112 factories engage more than 11,000 hands. It also has tanneries, and manufactories of buckskin, leather goods, artificial flowers, and dyestuffs. Forst was founded in the thirteenth century. It has belonged to Prussia since 1815. Pop., 1900, 32,075, 1910, 33,875.

FORSTEMANN, för'ste-man, ERNST WILHELM (1822-1907). A German philologist, born in Danzig. In 1865 he became chief librarian at the Royal Library in Dresden. His services in behalf of the reorganization of the Dresden Library were most important. His principal publications include *Altdeutsches Namenbuch* (2 vols., 2d ed., vol. 1, 1900, 2d ed., vol. 11, 1872), a valuable and interesting work devoted to a discussion of old German proper names, the volumes being respectively devoted to names of persons and places, *Geschichte des deutschen Sprachstamms* (1874-75), *Aus dem alten Danzig, 1820-40* (1900), and commentaries on the Maya manuscripts in the libraries of Dresden (1901), Madrid (1902), and Paris (1903).

FORSTER, för'stër, AUGUST (1822-65). A German anatomist, born at Weimar and educated at Jena. He held professorships at Göttingen (1852-56) and Würzburg (1856-65), where his investigations on pathological histology and teratology gave him a wide reputation. His chief publications include *Lehrbuch der pathologischen Anatomie* (10th ed., 1875), *Atlas der mikroskopischen pathologischen Anatomie* (1854-59), *Grundriss der Encyclopädie und Methodologie der Medizin* (1857).

FÖRSTER, ERNST (1800-85). A German art critic and painter, brother of Friedrich Christoph, the historian and poet. He was born at Munchengosserstadt, Saxe-Meiningen, April 8, 1800, and at first studied theology and philosophy, but, soon devoting himself to art, entered the studio of Peter Cornelius at Munich. He was employed in painting the frescoes in the Aula at Bonn, and those of the Glyptothek and the arcades at Munich, but his reputation rests chiefly on his researches and writings on the history of art. His greatest discovery was the frescoes by Jacopo di Avanzo (1376), in the chapel of San Giorgio at Padua. Among his paintings are "Hellas Liberated" and portraits

of the Duke and Duchess of Altenburg and children. Among his frescoes are scenes from Goethe's poems, and scenes from Wieland's *Musarion* and *Die Grazien*, Royal Palace, Munich. Among his works are *Die Wandgemälde der Sanct Georgenkapelle zu Padua* (1841), *Vorschule der Kunstgeschichte* (1862), *Denkmale deutscher Baukunst, Bildnerei und Malerei* (1855-69), *Geschichte der deutschen Kunst* (1851-60), *Geschichte der italienischen Kunst* (1869-78), *Peter von Cornelius* (1874). Most of these works were illustrated by woodcuts after his own designs. He wrote a life of Jean Paul Richter, who was his father-in-law, and edited several of his works. He died at Munich, April 29, 1885.

FORSTER, för'stär, FRANÇOIS (1790-1872). A French engraver, born at Locle, Switzerland. He studied in Paris under the engraver Langlois, and then entered the Ecole des Beaux-Arts, where he won the Grand Prix de Rome in 1814. He was one of the foremost engravers on steel of his time, and handled the graver with remarkable skill, elegance, and firmness. He is, however, often too coldly correct and fails to render the spirit of the original. Among his most important plates are "Francis I and Charles V Visiting the Church of St Denis" (1826, after Gros), "Æneas and Dido," after Guérin (1828); "The Virgin of the Bas Relief," after da Vinci (1835), "The Madonna of the House of Orleans" (1838, after Raphael), "Christ on the Cross," after Sebastiano del Piombo (1851), and the portraits of Raphael, Durer, Humboldt, Wellington (after Gérard), and others. He was appointed a member of the Institute in 1844.

FORSTER, fër'stär, FRANZ (1819-78). A German jurist. He was born and educated at Breslau, in 1868 became a member of the Prussian Ministry of Justice, and in 1874 was appointed director in the Ministry of Ecclesiastical Affairs. He assisted in the compilation of the new Prussian Code of Judicial Procedure and wrote several standard works on Prussian law, notably, *Theorie und Praxis des heutigen gemeinen preussischen Privatrechts* (7th ed, 1896-97).

FÖRSTER, FRIEDRICH CHRISTOPH (1791-1868). A German historian and poet, brother of Ernst, the painter. He was born near Kamburg, Saxe-Meiningen, and studied theology at Jena, then chiefly archæology and the history of art. On the uprising of Prussia against France in 1813 he joined the Lutzow sharpshooters with Theodor Körner and, like him, wrote spirited war songs, many of which appeared in his *Gedichte* (1838). At the close of the war he became professor in the school of engineering and artillery in Berlin, but on account of democratic writings was dismissed in 1817. He then worked on various literary journals, among them the *Neue Berliner Monatsschrift* and the *Vossische Zeitung*, and in 1829 was made curator in the Royal Museum of Berlin. His writings include *Albrecht von Wallenstein* (1834); *Gustav Adolf* (1833), an historical drama, *Preussens Helden in Krieg und Frieden* (1846), a severely criticized history of Prussia from 1640 to 1815, and an unfinished autobiography published posthumously in 1873, under the title *Kunst und Leben*.

FORSTER, fër'stär, HEINRICH (1800-81). A German Roman Catholic prelate. He was

born at Grossglogau, was educated at Breslau, took priest's orders in 1825, and in 1837 was appointed chief preacher at the cathedral of Breslau. In 1853 he was elected Bishop of Breslau. At numerous synods and councils he proved himself a staunch defender of the orthodox Roman Catholic creed, although he opposed the dogma of infallibility at the Council of the Vatican. In 1875, after repeated conflicts with the Prussian May laws (qv), in which he excommunicated priests who submitted to the state, and after violent demonstrations at the time of his jubilee as a priest, he was deposed from his see. He was a famous pulpit orator. His principal works are *Der Ruf der Kirche in die Gegenwart* (4th ed, 1879), *Die christliche Familie* (6th ed, 1893), *Kardinal Diepenbrock* (3d ed, 1878), *Gesammelte Kanzelvorträge* (5th ed, 1879). Consult A. Franz, *Forster, Fürstbischof von Breslau* (Breslau, 1875).

FORSTER, JOHAN GEORG ADAM (1754-94). A German traveler and naturalist, born at Nassenhuben, near Danzig. When 17 years old, he accompanied his father, Johann Reinhold Forster, in Captain Cook's third voyage around the world (1772) and on his return collaborated with him in an account of it, written in English, and entitled *Observations upon a Voyage around the World* (2 vols, 1777). After some time spent in Paris, where he made the acquaintance of Franklin and Buffon, he accepted a professorship of natural history at Cassel in 1778 and in 1784 was appointed to a similar position at Vilna. He now obtained the degree of M.D. In 1787 he was called to Russia by Catharine II to undertake a voyage of discovery, which was abandoned on the outbreak of the Turkish War. In the following year he accepted the office of librarian to the Elector of Mainz. After the taking of Mainz by the French in 1792, Forster, who had become an enthusiastic Republican, went to Paris as the representative of the city, to secure its incorporation in the Republic. In the recapture of Mainz by the Prussians in the next year he lost his library and collections and determined to remain in Paris, where he died in 1794, while preparing to make an extensive trip to East India. Besides numerous briefer works on scientific subjects, he wrote *Kleine Schriften en Beitrag zur Lander- und Völkerkunde, Naturgeschichte und Philosophie des Lebens* (1879-97) and *Ansichten vom Niederrhein, von Brabant, Flandern, Holland, England und Frankreich* (1790-91). His letters were published by his wife, Therese, afterward Therese Huber (2 vols, 1829), and his complete works edited by his daughter, with a characterization of the author by Gervinus (1843). Consult König (2d ed, Leipzig, 1858); Moleschott (Hamm, 1862); Leitzmann (Halle, 1893).

FORSTER, JOHANN REINHOLD (1729-98). A German traveler and naturalist, born in Dirschau, and educated for the clerical profession at Halle. In 1753 he became pastor at Nassenhuben, near Danzig, but devoted most of his time to mathematics and the natural sciences. In 1765 he accepted an offer made to him by the Russian government to inspect and report upon the new colonies founded on the banks of the Volga. His irritable temper soon involved him in difficulties with the Russian government, and in the following year he went to England and became teacher of natural history at Warring-

ton, Lancashire In 1772 he was invited to take part in Cook's second expedition to the South Seas In 1777 he published, in collaboration with his son, his *Observations upon a Voyage around the World*, containing the information he had gathered in course of that voyage In the same year he returned to Germany and in 1780 became professor of natural history and mineralogy at Halle Besides the above work, he published *Zoologia Indica* (1781) and *Geschichte der Schifffahrt und Entdeckungen im Norden* (1784)

FORSTER, JOHN (1812-76) An English biographer and political and historical writer, born at Newcastle He was educated for the bar, but early devoted himself to periodical writing His political articles in the London *Examiner*, for which he began writing in 1832, attracted unusual attention, owing to their vigor and outspoken honesty In 1846 he succeeded Dickens as editor of the *Daily News*, but resigned the next year to assume the editorship of the *Examiner*, a post which he held for nine years Among his works are *Lives of the Statesmen of the Commonwealth* (1836-39), *The Debates on the Grand Remonstrance* (1860), *Arrest of the Five Members* (1860), *Sir John Eliot A Biography* (1864), *The Life and Adventures of Oliver Goldsmith* (1848, enlarged, with a slight change in the title—*Life and Times of Oliver Goldsmith*—1854, an excellent piece of work), *Walter Savage Landor* (1869), *The Life of Charles Dickens* (1872-74), indispensable to the student of Dickens, and the first volume of a *Life of Swift* (1876) Forster was appointed secretary to the Commissioners in Lunacy in 1855, and Commissioner in Lunacy in 1861 In 1911 appeared the "Memorial Edition" of *The Life of Dickens* (2 vols, New York), with 500 illustrations, facsimiles, etc Consult R Renton, *John Forster and his Friendships* (New York, 1913)

FORSTER, JOHN COOPER (1823-86) A British surgeon He was born at Lambeth, London, and attended King's College School In 1841 he entered Guy's Hospital, where he was demonstrator in anatomy (1850-55), assistant surgeon (1855-70), and surgeon (1870-80), and he became a member of the College of Surgeons in 1844, a fellow in 1849, and was president of that body in 1884-85 He was peculiarly successful in operations required by intestinal diseases His publications include various papers in the *Transactions of the Pathological and Clinical Society*, and *The Surgical Diseases of Children* (1860).

FORSTER, FER'STÄR, KARL (1784-1841) A German poet He was born at Naumburg, the son of a clergyman in that city After studying theology and philosophy at Leipzig he was appointed professor of the German language and literature at the Military Academy in Dresden in 1807 He completed Wilhelm Müller's *Bibliothek der deutschen Dichter des 17ten Jahrhunderts* and wrote many poems, several of which have been set to music They were collected and published in 1843 His translations from the classic poets of Italy are also justly celebrated

FORSTER, LUDWIG VON (1797-1863). A German architect, born at Bayreuth He is chiefly remarkable for the impetus he gave to German and Austrian architecture by the foundation in 1836 of the *Allgemeine Bauzeitung*, a

review devoted to that subject Among the buildings erected by him in Vienna are the synagogue in the Leopoldstadt (1838) and the Protestant Church of Gumpendorf (1849) He was also architect for the Elizabeth Bridge All his work is in and near Vienna and is executed in Renaissance style

FORSTER, RICHARD (1843-) A German philologist and archaeologist. He was born at Gorlitz and was educated at Jena and Breslau In 1890 he was appointed professor of classical philology and in 1899 of archaeology at the University of Breslau His works include *Der Raub und die Rückkehr der Persephone* (1874), *Farnesina-Studien* (1880), *Scriptores Physiognomici Græci et Latini* (1893), *Libani opera* (1903-13), and he edited Moritz von Schwindt's *Philostratische Gemälde* (1903) and J C Handke's *Selbstbiographie* (1911)

FORSTER, WENDELIN (1844-). A German philologist and Romance scholar, born at Wildschutz, Bohemia, and educated in Vienna He was professor at Vienna and Prague from 1874 to 1876 and at Bonn after 1876 One of his most noteworthy achievements has been the definite establishment of the Breton origin of the Arthurian legend His numerous publications of the older French writers include *Élie de Saint Galle* (1876-82), *Les Chevaliers as deus especs* (1877), *Altfranzösische Bibliothek*, vols 1-xi (1879-87), *Romanische Bibliothek*, vols 1-xx (1888-1913), *Die sammtlichen Werke von Christian von Troyes*, vols 1-iv (1884-99), *Wörterbuch zu Christian von Troyes* (1914)

FORSTER, WILHELM (1832-). A German astronomer, born at Grunberg, Silesia He studied at Berlin and Bonn, became professor of astronomy at Berlin in 1863, and was director of the observatory from 1865 to 1903 In 1868 he was also appointed director of the commission established by the North German Confederation for the determination of standards of measurement In this capacity he superintended the reorganization of the German system of weights and measures on the metric basis He was elected president of the International Bureau of Weights and Measures in 1891 In 1892 he assisted in founding the German Society for Ethical Culture His publications include *Populäre Mitteilungen* (1879-84), *Sammlung von Vorträgen und Abhandlungen* (4 parts, 1876-96), *Studien zur Astrometrie* (1888), *Lebensfragen und Lebensbilder* (2 vols, 1902-04)

FORSTER, WILLIAM (1784-1854). An English Quaker philanthropist, born at Tottenham He became a preacher in the Society of Friends, labored in the United States, England, and France, and in 1846 went to Ireland to relieve the distress there caused by famine In 1849 he was commissioned by the Quaker Yearly Meeting in London to present an address on slavery and the slave trade to rulers of the Christian nations, and within the next few years he had interviews with nearly all the monarchs of Europe, with the President of the United States, and with the governors of a number of the Southern States Consult Seebohm (ed), *Memoirs of the Life of William Forster* (2 vols, London, 1865)

FORSTER, WILLIAM EDWARD (1818-86) An English statesman, the only son of William Forster, the Quaker missionary, and of his wife, a sister of Sir Thomas F. Buxton He was born

at Bradpole, Dorsetshire, was educated in Friends' schools at Bristol and Tottenham, and entered the woolen business at Bradford in 1841, where in the following year he formed a partnership with William Fison in that business, which continued to the end of his life. In 1850 he married a daughter of Thomas Arnold of Rugby and was excommunicated from the Society of Friends. He was defeated in 1859, when he stood for Leeds, but in 1861 he was elected from Bradford to the House of Commons and continued to hold his seat by successive reelections until his death. Forster at once took a prominent part in parliamentary debates and became one of the principal leaders of the advanced Liberals. He often spoke on the question of the reform of the suffrage, and on the outbreak of the Civil War in America, with Cobden and Bright, earnestly opposed every attempt to recognize the Confederacy, and denounced the government's action in permitting vessels of the *Alabama* type to be built and fitted out in English ports. In 1865 he became Undersecretary of State for the Colonies in Lord Russell's ministry, and in 1868 was appointed by Gladstone Vice President of the Council on Education and Privy Councillor. In 1869, in spite of opposition from Radicals both in the Church of England and among Dissenters, he secured the passage of the Endowed Schools Bill, and in 1870 introduced the Elementary Education Bill, which he had prepared and which is the foundation of the existing national system of education in England. In 1872 he introduced and piloted through the House of Commons the Ballot Bill. He visited Turkey for the second time in 1876 and thereafter took so moderate a position on the Eastern Question as to put him partly out of sympathy with Gladstone. In the Gladstone ministry of 1880, against his own inclination, he accepted the position of Chief Secretary for Ireland. In 1881 he introduced his drastic bill "for the protection of person and property in Ireland" (passed March 2). During the winter of 1881-82 several attempts were made on Forster's life by the "Invincibles," but he remained resolutely at his post. In May, 1882, when a majority of the cabinet determined upon the release of Parnell and the other imprisoned leaders, Forster and Lord Cowper, the Lord Lieutenant, protested and resigned. Although Forster continued to take part in the debates in Parliament—drawing particular attention by his bold attacks on Parnell—and was reelected as a Liberal by his constituents in November, 1885, he acted on many questions independently of his party, and opposed the Gladstone Home Rule programme. He favored Imperial federation as early as 1875 and was first president (1884) of the Imperial Federation League. There is a statue of him in the city of Bradford. Consult Wemyss Reid, *Life of the Right Hon W E Forster* (5th ed., London, 1889).

FORSYTH, för-sith', ANDREW RUSSELL (1858-) An English mathematician, born at Glasgow. He was educated at Liverpool College, and at Trinity College, Cambridge, where he was senior wrangler and first Smith's prizeman. He was made fellow of Trinity in 1881, was professor of mathematics at University College, Liverpool, from 1882 to 1883, and lecturer in Trinity College, Cambridge, from 1884 to 1895. He was made a fellow of the Royal Society in 1886 and succeeded Cayley as Sadlerian pro-

fessor of pure mathematics at Cambridge in 1895. He resigned this position a few years later and became in 1913 professor in the Imperial College of Science and Technology, London. His principal publications are *Treatise on Differential Equations* (1885), *Theory of Differential Equations* (1890, 2d ed., 1901), *Theory of Functions of a Complex Variable* (1893, 2d ed., 1900), *Lectures on the Differential Geometry of Curves and Surfaces* (1912). He has also published numerous memoirs on differential equations and the theory of functions, in the *Transactions of the Cambridge Philosophical Society* and in the *Philosophical Transactions of the Royal Society* (London).

FORSYTH, GEORGE ALEXANDER (1837-1915). An American soldier, born at Muncy, Pa. At the outbreak of the Civil War he enlisted as a private in the Chicago Dragoons. He fought throughout the war successively in the Army of West Virginia, that of the Potomac, and that of the Shenandoah, and was four times wounded in service. He rose to be brevet brigadier general of volunteers in 1865, was brevetted lieutenant colonel, United States army, in 1867 (for gallantry at Dinwiddie Court House) and lieutenant colonel of the Fourth United States Cavalry in 1881. He was brevetted brigadier general in the regular army in 1868 for conduct in battle with hostile Indians. In 1875-76 he was a member of the board of officers appointed to inspect the armies of Europe and Asia, and from 1866 until his retirement in 1890 was on staff and frontier service. He published *Thrilling Days in Army Life* (1900) and *The Story of the Soldier* (1900).

FORSYTH, JAMES WILLIAM (1836-1906). An American soldier, born in Ohio. He graduated at the United States Military Academy in 1856, in the Civil War served as captain on the staff of Major General McClellan during the Peninsular and Maryland campaigns, was brevetted major for gallant services at Chickamauga, and in 1864-65 was assistant adjutant general of volunteers and chief of staff of Major General Sheridan. In 1865 he had attained the rank of brigadier general of volunteers and brevet brigadier general, United States army. He was assistant inspector general of the Department of the Gulf in 1866-67 and in 1869-73 was aid to Lieutenant General Sheridan. From 1873 to 1878 he was military secretary of the Division of the Missouri, in 1886 became colonel of the Seventh United States Cavalry, and in 1894 brigadier general, and in 1897 was retired with commission as major general. He published, with F D Grant, a *Report of an Expedition up the Yellowstone River* (1875).

FORSYTH, JOHN (1780-1841). An American politician. He was born at Fredericksburg, Va., graduated at Princeton in 1799, and in 1802 was admitted to the bar at Augusta, Ga. He became Attorney-General of the State in 1808 and served as a Democrat in Congress from 1813 to 1818, when he was chosen United States Senator. In 1819 President Monroe appointed him United States Minister to Spain. At Madrid he concluded the negotiations for the sale of Florida to the United States. On his return to the United States in 1822 he was again elected to Congress and was reelected in 1824. In 1827 he was elected Governor of Georgia and in 1829 was for a second time sent to the United States Senate. He advocated Jackson's measures and in 1834 was appointed Secretary of

State and resigned his seat in the Senate. He was head of the State Department during the remainder of Jackson's administration and was continued in office through the entire administration of President Van Buren, whose friendship he had won in 1831 when the Senate refused to confirm his nomination as Minister to England.

FORSYTH, PETER TAYLOR (1848-) A British Congregational clergyman. He was born in Aberdeen, studied and taught in the University of Aberdeen, and then studied at Gottingen under Ritschl—who influenced him probably even more than did F. D. Maurice—and at New College, Hampstead. Among his charges were churches in Manchester, Leicester, and Cambridge. In 1901 he became principal of Hackney Theological College, Hampstead. His Lyman Beecher lectures at Yale University in 1907 were published under the title *Positive Preaching and Modern Mind*. He published, besides *The Person and Place of Christ* (1909), Congregational Union lecture for 1909), *The Work of Christ* (1911), *Christ on Parnassus* (1911), *Faith, Freedom, and the Future* (1912), *The Principle of Authority* (1913). Consult Hermann in *Homiletic Review* (New York, 1913).

FORSYTH, SIR THOMAS DOUGLAS (1827-86) An Anglo-Indian legislator, born at Birkenhead and educated at Sherborne, Rugby, Haileybury, and Calcutta. He was in 1860 appointed commissioner in the Punjab, was sent to St. Petersburg in 1869 about the Afghan boundaries, in 1870 and 1873 went on missions to Yarkand which were of great scientific importance, and in 1872 had the task of suppressing the insurrection at Malair Kotla. In 1873 he was appointed envoy to Kashgar and in 1875 was sent in the same capacity to the King of Burma to effect a settlement of the question of the Karens. Consult his *Autobiography* (London, 1887), edited by his daughter.

FORSYTH, WILLIAM (1812-99) An English author, born at Greenock, Scotland, and educated at Trinity College, Cambridge, where he took his M.A. in 1837. From 1859 to 1872 he was standing counsel to the Secretary of State for India, and from 1874 to 1880 was a member of Parliament from Marylebone. He was editor of the *Annual Register* from 1842 to 1868. His published works include *On the Law of Composition with Creditors* (1841), *Hortensius* (1849, 2d ed., 1874), an historical sketch of the bar from the earliest times, *History of Trial by Jury* (1852), *History of the Captivity of Napoleon at St. Helena* (1853), *Civil Liberty and Self-Government* (1856), *Life of Cicero* (1863), *Novels and Novelists of the Eighteenth Century* (1871), *Hannibal in Italy* (1872), an historical drama in verse, *Essays, Critical and Narrative* (1874), *The Slavonic Provinces South of the Danube* (1876).

FORSYTHIA, fôr-sîth'i-a (Neo-Lat., named in honor of William Forsyth, a Scottish botanist). A genus of shrubs of the family Oleaceæ, *Forsythia viridissima*, *Forsythia fortunei*, and *Forsythia suspensa*, small Chinese shrubs now commonly cultivated under the names "golden bell" and "golden rain." They are hardy and noticeable for their yellow flowers, which appear before the leaves.

FORT. In the United States all permanently garrisoned posts, whether fortified or not, are called forts. In 1914 there were 159 of these

posts, some of the most important of which are described in the following pages. For a list of garrisoned posts in the United States and foreign possessions, giving post office, telephone, telegraph, and railroad communication, consult the monthly *Army List and Directory*, issued by the Adjutant General's Office, Washington, D. C. In fortification (qv), the term *fort* is usually applied to a work entirely inclosed by defensible parapets and of great strength, either by reason of its trace or its armament. If the trace is the outline of a *star*, we have a *star fort*, if it includes bastions, a *bastioned fort*.

FORT ADAMS. A United States military post, situated at Brenton's Point, Newport, R. I., the site of which was first occupied for defensive purposes during the Revolutionary War and by a permanent garrison in 1799. In 1914 it was the headquarters of the coast defenses of Narragansett Bay and had a garrison of five companies of coast artillery in 1914.

FORTALEZA, fôr'ta-lá'za (from Fort Alexis), or **CEARÁ.** The capital of the State of Ceará, Brazil, situated on an open bay, near the mouth of the Rio Ceará (Map Brazil, K 4). It is regularly built, with broad and well-paved streets, and is one of the most beautiful cities of Brazil. Though surrounded by a sterile region, it is connected by rail with fertile inland sections. The harbor is subject to constant silting and is difficult of access, but these defects are being remedied by extensive harbor works. Fortaleza is the chief port of the State, and has an active trade in rubber, cotton, drugs, coffee, sugar, and animal products. The first settlement here was a fort established by Amparo, in 1611, to hold the Indians in check and to prevent the Dutch from gaining a foothold in this vicinity. The city is the residence of a United States consul. Pop. (est.), 50,000.

FORT ANCIENT. A prehistoric Indian fortification in Warren Co., Ohio, which is now preserved in a State park. Consult Shepherd, *Antiquities of Ohio* (Cincinnati, 1887), and Moorehead, *Fort Ancient* (Andover, Mass., 1908), which contains a bibliography.

FORT ANDREWS. A United States military post, forming one of the defenses of Boston Harbor, Mass., and consisting of a reservation of 3313 acres established in 1901. It is 9 miles distant from the city of Boston, which serves as the nearest telegraph and railway station, there being a post office at the post. The usual garrison is five companies of coast artillery.

FORT ANN. A village in Washington Co., N. Y., 67 miles by rail north of Troy, on the Champlain Canal, and on the Delaware and Hudson Railroad (Map New York, G 4). It is a summer resort, and manufactures knit goods, lumber, and condensed milk. Pop., 1900, 431, 1910, 436. In 1690 Fitz-John Winthrop, in his expedition against Canada, fortified a camp here. A fort, called Fort Peter Schuyler, was built here by Colonel Nicholson on his Canadian expedition in 1709 and was rebuilt in 1757 and named Fort Ann. In 1758, during the French and Indian War, Captain Robert Rogers defeated near here the French and Indians under Marin, and in 1777, during the Revolutionary War, a small force of Americans under Colonel Long, fleeing from Ticonderoga, was defeated here by the British, who occupied and partly destroyed the fortifications. Fort Ann was incorporated as a village in 1820.

FORT ASSINNIBOINE, äs-sin'i-boin A former United States military post situated on the Great Northern Railway, 7 miles distant from Havre, Montana. The reservation numbers about 222,000 acres. In 1912 this reservation was relinquished by the War Department and turned over to the Interior Department.

FORT ATKINSON A city in Jefferson Co., Wis., 55 miles west-southwest of Milwaukee on the Chicago and Northwestern Railroad, and on Rock River (Map Wisconsin, B 6). It is in an agricultural region and has knitting mills, meat-packing houses, and manufactures harrows, ventilators, dairy machinery, chairs, sleighs, carriages, and creamery products. It is governed by a biennially elected mayor and a unicameral council and has municipal water works and electric-light plant. The city derives its name from a fort built there in 1836 by General Atkinson during the Black Hawk War. Pop., 1900, 3043, 1910, 3877.

FORT BAKER. A United States military post, a part of the defenses of San Francisco harbor, and situated near Sausalito, Cal., 6 miles from the city of San Francisco. It was established in 1899 and consists of 1899.66 acres. The garrison consists of three companies of coast artillery (1914).

FORT BANKS A United States military post located at Winthrop, Mass., established in 1889 as a part of the defenses of Boston harbor. It is seven miles distant from Boston. It had in 1914 a garrison of two companies of coast artillery and an armament of 16 12-inch breech-loading mortars.

FORT BARRAN/CAS A United States military post situated in the harbor of Pensacola, Fla., 8 miles distant from the town of that name. It was established in 1870, and connected with it are the two subposts of Fort Dickens and Fort McRee. Fort Barrancas is the headquarters of the Artillery District of Pensacola and has (1914) a garrison of four companies of coast artillery.

FORT BAYARD A United States military reservation in New Mexico, no longer a garrisoned post, but a general military hospital for the treatment of pulmonary tuberculosis. It has a post office and telegraph station and is 2 miles distant from the railway station of Bayard. The military reservation, which comprises about 520 acres, was established as a post in 1866, but in 1900 was discontinued and turned over to the surgeon-general for hospital purposes, a detachment of the hospital corps forming its garrison.

FORT BENJAMIN HARRISON A United States military post located at Indianapolis, Ind., 10 miles from the city.

FORT BLISS. A United States military post situated at El Paso, Texas, with a garrison whose strength and character vary with conditions on the Mexican frontier. In 1914 all mobile arms of the service were stationed here.

FORT BOWYER. A fort, formerly situated on Mobile Point, at the entrance to Mobile Bay. It was built by General Wilkinson in April, 1813, was garrisoned by General Jackson with 160 men under Major William Lawrence, and on Sept. 14, 1814, was unsuccessfully attacked by a small naval and land force under Capt. W. H. Percy. On Feb. 8, 1815, after the battle of New Orleans, it was again attacked by the British, and on the 11th it surrendered.

Consult Adams, *History of the United States*, vol. VIII (New York, 1889-91), and Lossing, *Pictorial Field Book of the War of 1812* (ib., 1868).

FORT BRADY A United States military post, established in 1822, comprising 75 acres and located 1 mile from Sault Ste. Marie, Mich., and having a garrison of an infantry detachment (1914).

FORT BRAGG A city in Mendocino Co., Cal., 125 miles (direct) north of San Francisco, on the lines of the National Steamship Company and the California Western Railroad and Navigation Company (Map California, B 3). It contains a public library and has extensive lumbering mills, canning works, and creamery, tank factory, sash and door stock shops, and bottling works. The city was named after Gen. Braxton Bragg, who was stationed at the government post then here, succeeding Capt. U. S. Grant. The water works are owned by the municipality. Pop., 1900, 1590, 1910, 2408.

FORT BROWN A former United States military post situated on the frontier at Brownsville, Tex., for many years. In 1911 it was relinquished by the War Department and turned over to the Interior Department.

FORT CANBY A United States military post, established in 1864, on the north side of the mouth of the Columbia River, Washington, and a subpost of Fort Stevens, Oreg., 10 miles distant. It was originally called Fort Cape Disappointment, but the name was changed to Canby in honor of the distinguished officer of that name, killed by the Modoc Indians. Its garrison was temporarily withdrawn in 1905-06 while the post was rebuilding and in 1914 was a detachment of coast artillery. Communication is had by steamer and Northern Pacific Railroad with Portland, Oreg., 114 miles, and Seattle, Wash., 222 miles.

FORT CASEY A United States military post, situated at Port Townsend, Washington, 53 miles from Seattle, on Puget Sound, with a garrison of three companies of coast artillery in 1914 and mounting important coast defenses.

FORT CASWELL, kăz'wəl A United States military post, established, 1825, on Oak Island, at Southport, N. C., 27 miles from Wilmington, N. C., with a garrison of three companies of artillery in 1914.

FORT CHIPPEWYAN, or **CHIPEWAYAN** A trading station of the Hudson's Bay Company at the southwest end of Lake Athabasca, Province of Alberta, Canada, opposite the mouth of the Athabasca River (Map Canada, H 5). It is one of the most populous of the far northern stations, owing to the location here of a mission containing about 100 hardy orphans, sent thither to be trained as future colonists.

FORT CHURCHILL A trading station of the Hudson's Bay Company, at the mouth of the Churchill River on the west shore of Hudson Bay (qv) (Map Canada, M 5).

FORT CLARK. A United States military post, established 1852, on Las Moras Creek, near Brackettville, Tex., which is the post office. The reservation comprises 3963 acres, it is 125 miles west of San Antonio on the Southern Pacific Railroad. It was designed for the protection of the San Antonio and Eagle Pass wagon road and for the protection of the Rio Grande border against depredations by Mexicans and Indians. In 1914 two squadrons were stationed here.

FORT CLINTON. A Revolutionary fort on the Hudson, near West Point, intended to make the river impassable for the British fleet in 1777

FORT COLLINS. A city and the county seat of Larimer Co., Colo., 74 miles by rail north of Denver, on the Cache la Poudre River, and on the Union Pacific and the Colorado and Southern railroads (Map Colorado, D 1). It is the seat of the State Agricultural College, opened in 1879, and connected with which is a United States horse-breeding station. A theological seminary (Lutheran) and the headquarters of the Colorado National Forest are also situated here. Other features include a Carnegie library, Federal building, courthouse, hospital, and several fine parks. The city is the centre of a fertile region, watered by extensive and efficient systems of irrigation. It has a large beet-sugar factory, alfalfa and flour mills, brick and tile works, and a steel-headgate plant. Fort Collins adopted the commission form of government in 1913. The water works are owned by the city. Pop., 1900, 3053, 1910, 8210, 1914 (U. S. est.), 10,407.

FORT COLUMBUS. See FORT JAY

FORT CROOK. A United States military post, situated on the Burlington and the Missouri Pacific railways in Nebraska, and having (1914) a garrison of a detachment of infantry.

FORT D. A. RUSSELL. A United States military post in Wyoming established in 1867, occupying a reservation of 4400 acres on a branch of the South Platte River, 3 miles from Cheyenne, on the Union Pacific Railroad. The post was increased to accommodate a brigade and has for its garrison bodies of troops varying in strength, but usually a force of cavalry.

FORT DAVIS. A garrisoned post of two companies, situated 3 miles east of Nome, Alaska.

FORT DEARBORN. A fort built on the site of Chicago in 1804-05, well known from a massacre which occurred near by, on Aug. 15, 1812. On that day the garrison of 67 men, under Capt. Nathan Heald, evacuated the fort, under injudicious orders from Gen. William Hull, and, accompanied by the resident settlers, some 30 in number, including women and children, started for Detroit under the escort of a body of Miami Indians. At a short distance from the fort they were attacked by an ambushed force of about 500 Indians, assisted by most of the escort, and two-thirds of their number were killed and the rest captured. Most of the captives were subsequently ransomed at Detroit. The fort was destroyed on the following day by the Indians, was rebuilt about 1816, was evacuated in 1823, was reoccupied in 1828, and was demolished in 1856. Consult Wentworth, *Early Chicago*, *Fort Dearborn* (Chicago, 1881), Kirkland, *The Chicago Massacre of 1812* (ib., 1893), an interesting narrative in Kinzie, *Wau-bun, or the Early Day, in the Northwest* (ib., 1857), the version, largely from the Indian standpoint, in an article, "The Massacre of Fort Dearborn, Gathered from the Traditions of the Indian Tribes Engaged in the Massacre," by Simon Pokagon, in *Harper's Magazine*, vol. xxviii (New York, 1899), Quaife, *Chicago and the Old Northwest, 1673-1835. A Study of the Evolution of the Northwestern Frontier, together with a History of Fort Dearborn* (Chicago, 1913).

FORT DE FRANCE, *fôr de frâns* (formerly Fort Royal). The capital of Martinique (qv), situated on the west coast of the island (Map West Indies, G 4). It has a good harbor and is

strongly fortified. In 1902 Fort de France became important as the distributing centre for supplies during the terrible eruptions of Mont Pelée (qv). Pop., 27,069.

FORT DE L'ÉCLUSE, *fôr de lâ'kluz'*. A fortress in the French Department of Ain, about 14 miles south of Geneva. It was erected by the dukes of Savoy, but was repeatedly destroyed by the Swiss during the sixteenth century. Rebuilt by Vauban at the command of Louis XIV, it was dismantled by the Austrians in 1815, but has been restored and strengthened. It occupies a crag 1385 feet high, at the foot of Mont Credo, which commands the passage of the Rhône from Switzerland through the defile of the Ecluse.

FORT DES MOINES, *de moim'*. A United States military post, 5 miles distant from the city of the same name in the State of Iowa. The post is of modern construction throughout and is usually garrisoned by an entire regiment of cavalry.

FORT DODGE. A city and the county seat of Webster Co., Iowa, 89 miles north by west of Des Moines, on the Minneapolis and St. Louis, the Illinois Central, the Fort Dodge, Des Moines, and Southern, and the Chicago Great Western railroads, and on the Des Moines River (Map Iowa, C 2). Fort Dodge contains Tobin College, St. Joseph's Mercy Hospital, a fine courthouse, and a Carnegie library. It is an important railroad centre and has great natural advantages. In the vicinity are vast coal fields, large deposits of glass sand and excellent clay, and quarries of brown sandstone. The city has extensive manufactures of gypsum and clay products, prints, brick and tile, foundry products, oatmeal, pottery, shoes, work clothing, etc. There are also greenhouses, with a large wholesale trade, and repair shops of the four railroads which enter the city. Fort Dodge adopted the commission form of government in 1911. It owns the water-works system. Pop., 1900, 12,126, 1910, 15,543, 1914 (U. S. est.), 16,872, 1920, 19,347.

FORT DON'ELSON. See FORT HENRY AND FORT DONELSON

FORT DOUGLAS. A United States military post in Utah, established in 1858 and occupying a reservation of 9250 acres at the base of the Wahsatch Mountains, 5030 feet above the sea. It was established to prevent depredations by Indians along the line of the overland mail route. There are a post office at the post, and a telegraph station at Salt Lake City, 3 miles distant. It is 37 miles from Ogden on the Union Pacific Railroad and has quarters for 500 cavalry or infantry, its garrison varying in strength.

FORT DU PONT. A United States military post in Delaware occupying a reservation of 173 acres opposite Pea Patch Island in New Castle County. The nearest post office and telegraph station are at Delaware City, Del. The garrison in 1914 was three companies of coast artillery.

FORT DU QUESNE, *du'kân'*. See PITTSBURGH

FORTE, *fôr'tâ*. In music, the Italian term for loud, *fortissimo*, very loud or forcible. In scores these expression marks are designated respectively by *f* and *ff*. Occasionally a double *fortissimo* (*fff*) is required, especially in piano arrangements of orchestral works.

FORT EDWARD. A village in Washington Co., N. Y., 56 miles north of Albany, on the Delaware and Hudson Railroad and on the

Barge Canal (Map New York, G 4) By means of a dam at this point the Hudson River furnishes good water power, and the village has extensive paper and pulp mills, a shirt factory, a brewery, a pottery, etc. First incorporated in 1849, Fort Edward is governed under a charter of 1857, which provides for a president, chosen annually, and a board of trustees, elected on a general ticket. The water works are owned by the municipality. Pop., 1900, 3521, 1910, 3762.

The site of Fort Edward was known to the French and English in the latter part of the seventeenth century and the early part of the eighteenth as the Great Carrying Place because of its accessibility to Lakes George and Champlain. In 1709 Colonel Nicholson, while on his unsuccessful expedition against Canada, built a stockade on the spot. This fell into decay, but in 1755, during the French and Indian War, another fort, called Fort Lyman at first after its builder, but soon renamed Fort Edward in honor of the Duke of York, was erected here. In 1757 the survivors of the Fort William Henry massacre took refuge within its walls. Throughout the French and Indian War and the Revolution the fort was the starting point for expeditions against Canada. In 1777 it was for some time the headquarters of General Schuyler and later was occupied by General Burgoyne. Near here, on July 27, 1777, Jane McCrea (qv) was killed by the Indians. Consult Parkman, *Montcalm and Wolfe* (Boston, 1884), "Fort Edward in 1779-80," in the *Historical Magazine*, 2d series, vol. 11 (ib, 1867), *The Fort Edward Book* (Fort Edward, 1903).

FORTEGUERRI, fôr'tâ-gwêr'rê, NICCOLÒ (1674-1735). An Italian poet, born at Pistoia. Being a younger son, he was destined for the church, and in 1695 he was sent to Rome to his uncle, Cardinal Fabroni. He accompanied an embassy to Spain, and, now in favor and again disgraced, occupied successively many ecclesiastical offices, being secretary of the Propaganda when he died. During his life only a few of his rhymes and prayers were published. His more important works, the *Capitoli*, the *Epistole poetiche*, and the comic epic *Il Ricciardetto* (1738), written under the pseudonym Cartormaco, were published posthumously. We owe to him also a blank-verse translation into Italian of the comedies of Terence (1736). In his original works, which, as the form shows, are largely improvised, the comic element predominates, though bitter attacks upon the monastic orders are not infrequent. Consult the edition of his works in the *Classici italiani* (Milan, 1813), to which is prefixed an Italian translation of Fabroni's biography in Latin, and C. Zaccchetti, *Il Ricciardetto di Niccolò Forteguerra* (Torino, 1899).

FORT E'RIE. A fort, formerly situated in Canada, at the head of the Niagara River, opposite Buffalo, N. Y., on the site of the present village of the same name (pop. 1911, 1146); the scene of considerable fighting in the War of 1812. It was abandoned and partially destroyed by the British on May 28, 1813, and in the succeeding two months was occupied alternately by the Americans and the British. On July 3 it was captured, with a garrison of 170 men, by the American General Jacob Brown (qv), and after the battle of Lundy's Lane, July 25, 1814, the whole American army, numbering about 2000 men, was withdrawn thither by General Ripley, who was soon replaced by General Gaines.

During their stay the fortifications were completed for the first time. The British under General Drummond advanced to attack, and from August 7 to August 14 kept up an almost constant bombardment. On Nov. 5, 1814, the fort was blown up by the Americans, and it was never subsequently rebuilt. Consult Adams, *History of the United States*, vols. VII and VIII (New York, 1889-91), and Dawson, *Battles of the United States* (ib., 1858).

FORTESCUE, CHICHESTER SAMUEL. See CARLINGFORD, CHICHESTER SAMUEL FORTESCUE, BARON.

FORTESCUE, HUGH, third EARL FORTESCUE (1818-1905). An English author and politician, born in London and educated at Harrow and at Trinity College, Cambridge. Lord Melbourne made him his private secretary in 1840. Elected in 1841 a member of Parliament, he was continued in the Lower House, except in 1852-54, until shortly before he succeeded to his father's title (1859), he had been Viscount Ebrington since 1841) and took his seat in the House of Lords (1861). He was a Lord of the Treasury in 1846-47, and Secretary of the Poor Law Board from 1847 to 1851. In politics he was a Liberal and a Liberal Unionist. He wrote several pamphlets, including *Lectures on the Health of Towns* (1845), *Official Salaries* (1851), *Representative Self-Government for London* (1854), *Public Schools for the Middle Classes* (1864), *Our Next Leap in the Dark* (1884).

FORTESCUE, SIR JOHN (c.1394-c.1476). An English judge, who came of an old Devonshire family and received his education at Exeter College, Oxford. He was King's serjeant at law in 1430 and in 1442 became Chief Justice of the King's Bench. It is known, from many records of the time, that in the early part of his career Fortescue was popular as a judge, but later fell into disfavor, because he belonged to the court party, hence he also supported Henry VI against Richard of York, and later against Edward IV. Many of his works were written to support the Lancastrian claims. Until the final defeat of the house of Lancaster at Tewkesbury, in 1471, he shared all their fortunes, and during the wanderings abroad, where Fortescue seems to have received the empty title of Chancellor from Henry VI, he wrote, for the instruction of young Prince Edward, his celebrated work, *De Laudibus Legum Angliæ*, a masterly eulogy of the laws of England. At Tewkesbury he fell into the hands of Edward IV, who pardoned him. He died at an advanced age, but the date has not been ascertained. A valuable and learned work by Fortescue, written in English, discussing the differences between an absolute and limited monarchy, was reedited by Plummer in 1885, under the title *The Governance of England*. His other works are numerous, but have little interest. Consult Plummer, introduction to *The Governance of England* (Oxford, 1885), Gardiner, *The Paston Letters* (London, 1872-75), Clermont's edition of Fortescue's works, in which all writings attributed to Fortescue are published (ib., 1869), Foss, *Lives of the Judges* (Boston, 1870), Oman, *History of England from Accession of Richard II to Death of Richard III, 1377-1485* (London, 1906).

FORTESCUE, SIR JOHN (c.1531-1607). An English statesman, son of Sir Adrian Fortescue, great-grandson of Sir John, the Chief Justice, and a distant cousin of Queen Elizabeth. His

father was executed in 1539, but the son—possibly educated at Oxford—had his property restored by an Act of Parliament in 1551. During Mary's reign his mother was in favor, and he was appointed instructor to the Princess Elizabeth. On the accession of Elizabeth he was made keeper of the great wardrobe. He entered Parliament in 1572, in 1589 succeeded Mildmay as Undertreasurer and Chancellor of the Exchequer, a very lucrative post, was knighted in 1592, and in 1601 became Chancellor of Lancaster. This post in the Exchequer he lost when James came to the throne, but the patents for the other two offices were reissued, and he twice entertained the King. In 1604 he was candidate for the seat for Buckinghamshire in an election declared void by the Court of Chancery (because Fortescue's opponent was outlawed), he was returned on a second election. The Commons challenged the right of Chancery to decide in such a case, and after compromise on a third election Fortescue was returned in 1606. He was an honest and able administrator—Queen Elizabeth said he outdid her expectation "for integrity"—no mean scholar, and an intimate friend of Sir Thomas Bodley, whose library owed much to Fortescue.

FORT ETHAN ALLEN A United States military post in Vermont, established in 1892 and occupying a reservation of 761 acres. The post office is Essex Junction, Vt., distant 2 miles, and the nearest telegraph station is Burlington, Vt. (6 miles away). There are quarters for a substantial force of cavalry and artillery and adequate stables. In 1914 a full regiment of cavalry was quartered here.

FORT FAIRFIELD A town in Aroostook Co., Me., 140 miles north of Bangor, on the Bangor and Aroostook and the Canadian Pacific railroads, and on the Aroostook River (Map Maine, E 2). It contains a Carnegie library, picturesque falls, and the old fort site. The town is a rich agricultural region, producing large quantities of potatoes. Pop., 1900, 4181, 1910, 4381.

FORT FISHER An earthwork in North Carolina, on the peninsula between the Atlantic Ocean and Cape Fear River, defending the entrance to the port of Wilmington. In the last year of the Civil War this was almost the only port open to the Confederates, and it became a matter of importance to the Federals to close it. To this end a formidable fleet under Admiral Porter left Hampton Roads on Dec. 13, 1864, and arrived in sight of the fort on December 20. At 1:40 A.M. on the 24th the powder boat *Louisa*, laden with 215 tons of powder, was exploded within 200 yards of the beach and 400 yards of the fort, but the latter sustained no appreciable damage. Later in the day the fleet opened fire, and in a little over an hour the guns of the fort were silenced. On the 25th the bombardment was renewed in order to cover the landing of the land forces under Gen. Benjamin F. Butler, but though a reconnoitring force went within 150 yards of the fort, an assault was deemed inadvisable, and the troops reembarked and returned to James River. The fleet, however, remained near the fort, and on Jan. 13, 1865, another military force of 8000 men, under command of Gen. A. H. Terry, was landed. The bombardment was renewed on the 13th and 14th, and on the 15th a joint assault of soldiers, sailors, and marines carried the fort, capturing more than 2000 prisoners and 169 guns. The

Union loss was 266 killed and 1018 wounded. Early on the 16th a magazine explosion, probably the result of an accident, killed more than 100 of the Federals and about as many of the Confederates. The Confederates then blew up their remaining works, the control of the mouth of Cape Fear River passed from their hands, and Wilmington was evacuated. Consult Ammen, *The Atlantic Coast* (New York, 1883), and Johnson and Buel, *The Battles and Leaders of the Civil War*, vol. IV (ib., 1887).

FORT FLAGLER. A United States military post, a part of the defenses of Puget Sound, situated at Port Townsend, Washington, 53 miles by boat from Seattle, and having a garrison of three companies of coast artillery.

FORT GAINES See MOBILE BAY, BATTLE OF. **FORT GAINES** A city and the county seat of Clay Co., Ga., 140 miles southwest of Macon, on the Chattahoochee River and on the Central of Georgia Railroad (Map Georgia, A 4). It is the centre of a cotton and fruit-growing region and has cottonseed-oil mills, brickyards, fertilizer factories, etc. The water works and electric-light plant are owned by the city. Pop., 1900 1305, 1910, 1320.

FORT GARRY See WINNIPEG.

FORT GEORGE A fort, formerly situated on the Canadian side of the Niagara River almost opposite Fort Niagara (qv), and in the village of Newark (now Niagara). On May 27, 1813, it was taken by an American force of 6000 under the actual command of Col. Winfield Scott and Commodore Perry (the commanding officer, General Dearborn, being ill). On December 10 the fort was evacuated by General McClure, to avoid an attack by a superior British force. Consult Dawson, *Battles of the United States* (New York, 1858), and Lossing, *Pictorial Field Book of the War of 1812* (ib., 1869).

FORT GIBBON A garrisoned post of three companies, situated on the north bank of the Yukon River, Alaska, at its junction with the Tanana. Adjoining it is the town of Tanana (pop., 398 in 1910), and also the St. James (Episcopal) mission.

FORT GRANT. A former United States military post in Arizona, occupying a reservation of 42,341 acres, originally called "Camp Grant," 26 miles from Wilcox, Ariz. In 1911 it was relinquished by the War Department and turned over to the Interior Department. It is situated 2500 feet above the sea, 56 miles north of Tucson, and was established about 1863 by the California Volunteers as a protection against the Apaches to the southern line of travel to California. Old Fort Grant was established in 1865, the new Fort Grant in 1872.

FORT GREBLE. A United States military post on Dutch Island, R. I., in Narragansett Bay. There is a post office at the post, and the telegraph and railway station is Newport, R. I. The garrison in 1914 consisted of three companies of coast artillery. The post is named after Lieutenant Greble, U. S. A., killed at the battle of Big Bethel, Va., in 1861.

FORT GRISWOLD, griz'wold, Conn. See GROTON.

FORTH A river and estuary of Scotland. The river is formed by the junction near Aberfoyle of two main head streams—the Duchray Water, 16 miles long, and the Avonduh, 12 miles long, which rise in the mountains between Lochs Katrine and Lomond in the northwest of Stirlingshire (Map Scotland, D 3). It traverses

a country rich in romantic scenery From Aberfoyle the Forth winds 39 miles southeasterly across the Carse of Stirling to Stirling, and at Alloa, 12 miles beyond, widens into the Firth of Forth (Map Scotland, F 3) The Firth extends 6 miles southeast, then, with an average breadth of $2\frac{1}{2}$ miles, continues 10 miles to Queensferry, where it contracts to a mile in width and is spanned by the celebrated cantilever railway bridge, 8295 feet long, with two main spans of 1710 feet each, opened in 1890 A little to the west of the Forth Bridge is the modern naval base of Rosyth The Firth extends 36 miles farther to the North Sea, expanding in width to 15 miles The river is navigable to Alloa by vessels of 300 tons and to Stirling by vessels of 100 tons A canal 38 miles long connects it with the Clyde Important salmon and herring fisheries and numerous pleasure resorts are located along its lower course

FORT HAMILTON A United States post, established in 1831, on the southwest shore of Long Island It is one of the principal defenses of New York City, commanding "the Narrows" The post-office and telegraph station is Fort Hamilton, Brooklyn, N Y In 1914 the garrison was five companies of coast artillery During the American Revolution the British landed here prior to the battle of Long Island, 1776

FORT HANCOCK A United States military post established in 1892, at Sandy Hook, N J, and commanding with its high-powered rifles and mortars one of the entrances to New York harbor There are post-office and telegraph stations at the post It was named after Major General Winfield Scott Hancock, U S A, and the fort is the headquarters of the artillery coast defenses of southern New York, embracing also Forts Hamilton and Wadsworth There is an artillery garrison, and in 1914 six companies of coast artillery were stationed here Here is located also the Sandy Hook Proving Ground of the Ordnance Department

FORTH BRIDGE, THE A cantilever bridge erected over the Firth of Forth at Queensferry, Scotland, in 1883-90, famous on account of the length of its spans The two main spans are each 1710 feet long, and the total length of the bridge is 8295 feet The towers are 343 feet in height The bridge contains 51,000 tons of steel, and the whole cost of construction was about \$13,000,000 Consult Philip Phillips, *The Forth Bridge in its Various Stages of Construction* (Edinburgh, n d)

FORT HENRY AND FORT DONELSON. Two forts, 12 miles apart, in Tennessee, prominent in the early period of the Civil War—the first situated on the right bank of the Tennessee River, and the second on the left bank of the Cumberland River, both standing near the line between Tennessee and Kentucky They were built and strongly manned by the Confederates in 1861 and were the two most important works in the first line of defense in the West They were especially important in that they controlled the entrance to two avenues by which Tennessee and the States farther south might be entered Early in 1862 General Grant, stationed at Cairo, asked and received permission to attempt their capture On February 2 a flotilla of gunboats under Com A H Foote, followed by land troops under Grant, left Cairo, and on the 4th arrived before Fort Henry, which was then defended by 3000 men under General Tilghman A combined attack by land and water was planned for

the 6th, but the fort was taken within an hour on that day by the naval forces alone, some time before the troops arrived The unavoidable delay of the latter enabled most of the garrison to escape to Fort Donelson, though Tilghman and about 70 of his men surrendered with the fort On the 12th Grant moved upon Fort Donelson with a force that ultimately numbered 27,000 The fort, having been considerably reinforced, had a garrison of between 18,000 and 21,000, including the commands of Generals Floyd, Pillow, and Buckner On the 13th Grant began a cannonade, and on the 14th an attack was also made by the fleet, but within two hours every gunboat was disabled, 54 men were killed, and Foote was compelled to withdraw The Confederates, hoping to open up a way for retreat towards Nashville, attempted a surprise on the morning of the 15th They were at first successful and actually secured a line of retreat, but they failed to profit by it, and at 3 P M Grant, who had been absent during the early part of the engagement, for the purpose of conferring with Commodore Foote, then wounded aboard his flagship, ordered a general advance, drove the Confederates within their own lines, and gained a position within their works About 2000 on each side were killed or wounded in the course of the day Grant prepared for a general assault early the next morning, but the Confederate leaders, recognizing the futility of further resistance, decided to surrender During the night Floyd with about 1500 men, Forrest with 500 or 600, and Pillow with his staff, escaped, leaving the fort in command of Buckner This officer had originally been ranked by both Floyd and Pillow, the former of whom, having his unsavory record as Secretary of War in mind, dreaded to surrender for "personal reasons," while the latter violently opposed the idea of surrendering at all On the morning of the 16th Buckner sent a message to Grant proposing an armistice until noon and the appointment of commissioners to settle upon terms of capitulation Grant returned on the instant the now famous reply "No terms except an unconditional and immediate surrender can be accepted I propose to move immediately upon your works" Buckner had no alternative and at once surrendered the fort with between 12,000 and 18,000 men, at least 40 guns, and a great quantity of ammunition. The terms of Grant's answer aroused the enthusiasm of the North, where, by a play upon the initial letters of his name, he soon came to be known as "Unconditional Surrender Grant" Consult *Official Records*, vol iv (Washington, 1881), Grant, *Personal Memoirs* (New York, 1895), Johnson and Buel, *Battles and Leaders of the Civil War*, vol 1 (ib, 1887), Force, *From Fort Henry to Corinth* (ib, 1881), Swinton, *Decisive Battles of the War* (ib, 1867), Ropes, *The Story of the Civil War*, part ii (ib, 1898), Steele, *American Campaigns* (Washington, 1909)

FORT H. G. WRIGHT. A United States military post, situated on Fisher's Island, 8 miles from New London, and forming a part of the defenses of Long Island Sound. It is the headquarters of the coast defenses of Long Island Sound and has a garrison of six companies of coast artillery.

FORT HOWARD. A United States military post, established in 1900, and occupying a reservation of 149 acres. The post office and

telegraph station is Baltimore. It is situated at North Point, Patapsco River, 17 miles from Baltimore, and in 1914 had a garrison of four companies of coast artillery.

FORTIER, fôr'tyâ', ALCÉE (1856-1914). An American scholar, born in St James Parish, La., and educated at the University of Virginia and in Paris. In 1880 he became professor of Romance languages at Tulane University (Louisiana), he also taught in a number of university summer schools. From 1888 to 1896 he was a member of the Louisiana State Board of Education, and from 1897 to 1902 president of the Catholic Winter School of America. He was president of the American Folk-Lore Society (1894), the Modern Language Association of America (1898), and the Federation Alliance Française (1906-07). Besides editing various French texts, he is author of *Le château de Chambord* (1884), *Gabriel d'Ennervich* (1886), *Bits of Louisiana Folk-Lore* (1888), *Sept grands auteurs du XIX^{me} siècle* (1889), *Histoire de la littérature française* (1893, new rev ed, 1913), *Louisiana Studies* (1894), *Louisiana Folk Tales* (1895), *Précis de l'histoire de France* (1899, new rev ed, 1913), *History of Louisiana* (1904), *History of Mexico* (1907).

FORTIFICATION (Sp. *fortificación*, It *fortificazione*, Fr *fortification*, Lat *fortificatio*, from *fortificare*, to fortify, from *fortis*, strong + *facere*, to make). That branch of military engineering which has to do with the design and construction of temporary and permanent defenses for the protection of military forces under fire. The subject may be divided into Field Fortification, which is properly a branch of Military Field Engineering, and Permanent Fortification, the latter being subdivided into Permanent Land Fortification and Seacoast Defense. This classification will be observed in the present treatment.

FIELD FORTIFICATION

The chief aim of a commander of a military force operating in the field is to have his army not only in the best possible condition, but in the best position for conflict with the enemy. In spite of precautions these conflicts may come about through accident, and an army forced to fight or in danger of attack must use every means at its command to strengthen or fortify a position which may or may not be of its commander's choosing. Often an unexpected collision of some portion of the force with the enemy may develop into a general battle. The army may be surprised in encampment. More frequently the commanders of the opposing forces will be in a general way aware of the position and strength of the enemy. Each will know whether on the whole he prefers to give battle or to obstruct the progress of his opponent as much as possible without bringing on a general engagement except in positions affording his army natural advantages. (See RECONNAISSANCE.) The latter course will, in general, be the lot of the weaker. The stronger may also strive to occupy positions which the weaker must attack to protect his own supplies. The commander expecting to be attacked will select the best available position for his troops—one which the natural advantages of the ground will make it easier for him to hold and more difficult for his opponent to attack. A section of the line will be assigned to each corps or division of his

army. The length of the section thus assigned will vary greatly under different circumstances. Ordinarily not less than six men, including those in the firing line, supports, and reserves, should be allotted for each yard of the line. Each subdivision, on reaching the portion of the line assigned to it, proceeds as rapidly as possible to fortify—i.e., to make stronger its line. If practicable, the position of the line will be indicated by the engineers, otherwise, it will be inspected as soon as possible with a view to strengthening it, wherever opportunity offers.

In the American Civil War, especially towards the latter part, the troops, as soon as they arrived on the line, began the construction of light trenches with their bayonets and cups. In several modern foreign armies the troops carry as a part of their equipment small intrenching spades or picks, with which a rifle pit or lying-down trench (Fig 1) is hastily con-

FIG 1 CROSS SECTION OF LYING-DOWN TRENCH

FIG 2 CROSS SECTION OF KNEELING TRENCH

FIG 3 CROSS SECTION OF STANDING TRENCH

structed. If time allows, this is enlarged, first into a kneeling trench (Fig 2) and then into a standing trench (Fig 3). The protection furnished by such a trench is ample against infantry fire, as 30 inches of earth will stop or deflect a modern rifle bullet. See TRENCH.

The opposing commander, if determined on a frontal attack, will probably make it at the earliest possible moment, in order that the defenders may have the minimum of advantage of protection from their defenses. His command, too, will probably proceed similarly to strengthen certain portions of their own line, which must be held. If successful in capturing any portion of the enemy's line, he may turn their intrenchments in order to prevent recapture. To frustrate these efforts the defender, circumstances permitting, will so strengthen his trenches that the parapets shall be able to resist artillery fire. This requires a thickness in ordinary soil of 10 feet or more.

The nomenclature of the various portions of the profile of such a work is indicated on the accompanying cut (Fig. 4). The superior slope will have an inclination forward of about 1 on 6 in order that the fire may sweep the ground in front. The horizontal projection of the interior crest is called the *trace* and is generally used as a ground or fundamental line in laying off more deliberate fortifications. If time allows, the interior slope of the parapet will be revetted with sod, fascines, hurdles, logs, sandbags, gabions, or other available material, and provision

will be made for drainage. Trenches will always be made as inconspicuous as possible. The illustrations (Figs. 5 and 6) show a front and rear view of a shelter trench where precautions have been taken to hide it from view in front. In the Cuban and Boer wars many trenches were

There are usually along the line points naturally much stronger than others. Special pains will be taken to secure and strongly fortify these points by the construction of *redoubts* (q.v.), which are inclosed works, usually polygonal, square, or triangular in shape, provided

FIG. 4. PROFILE OF FORTIFICATION.

made entirely in excavation and were practically invisible. The ground in front of the trenches within the most effective range of rifle fire should be cleared of everything which would hide an advancing enemy from view or afford him cover. Obstacles designed to hold an advancing

FIG. 5. SHELTER TRENCH—FRONT VIEW.

enemy as long as possible under sustained fire will be placed in front of the intrenchments. The principal modern obstacles are wire entanglements (Fig. 7) and abatis (q.v.). There are also trous-de-loup, or shallow military pits, chevaux-de-frise, crow's-feet, and other similar

FIG. 6. SHELTER TRENCH—REAR VIEW.

obstructions. If time allows, a portion of the ground will be mined with charges of explosives (see MINES AND MINING, MILITARY), arranged to fire automatically upon the passage of troops over them. In some cases the site for the defensive line can be so chosen that the land in front shall be marshy or can be flooded by damming a small stream.

with as many as possible of the structural advantages of regular fortification, and built on a scale commensurate with the strength and character of the force by which they are to be held. These are laid out on the ground in such a way as best to utilize the natural features in securing the maximum effectiveness of the redoubt at a minimum of labor of construction. As guides in making these constructions, light frameworks of wood, indicating the proper cross section, are made and placed in position at the angles of the work. In designing the *cross section* for a redoubt or intrenchment, it should be borne in mind that unless the excavation and embankment are equal in amount, earth may have to be carried some distance. In constructing such work it is usual to assign tasks to

FIG. 7. WIRE ENTANGLEMENTS.

each man or squad. About six feet or two paces of crest should be apportioned to each man. After slight experience a man can, under stress, excavate about one cubic yard of ordinary earth in the first hour, provided the lift and throw are not excessive. The amount which he can be counted upon to do per hour diminishes considerably after the first few hours. *Traverses* (q.v.) should be built where necessary on the works to protect portions of the line which would otherwise be enfiladed by fire from a distance. As soon as possible bombproof shelters should be dug out or constructed, and also, if the works are to be held for many days, magazines for the ammunition. The weak points of a defensive line are the flanks. The opposing commander may therefore strive to capture the line by attacking it in flank, where

he can bring a heavy fire to bear, and will have to meet only a small fire. It is therefore of great importance that the flanks should, if possible, rest on or near some natural obstacle, as a marsh or river, which will retard the movements of the enemy. If this cannot be done, special provision will have to be made for strengthening and holding them.

During the Mexican War (1846-47) and in more recent European wars, villages on the line were frequently placed in a state of defense. This was practicable because of the general use of masonry buildings and walls.

The artillery of the defense will be stationed in the intervals between redoubts behind epaulements, constructed by heaping earth in front of the guns, or in gun pits formed partially by embankments and partially by excavation.

Provision must be made for a system of roads in rear of the line along which troops can be transferred from one portion of the line to the other, or by which supplies or reserves may be brought, or along which a defeated or demoralized portion of the army can retire to a position in the rear, where it may be reformed. Bridges or other defiles in rear of the line which may serve as a line of retreat or supply should be well protected by blockhouses or *bridgeheads* at their ends, which will enable a small force to hold a large one in check while the army is passing.

The fortifications just described are generally known as *field fortifications*, sometimes as *hasty intrenchments*. Where they are more carefully constructed or improved, they become known as provisional, deliberate, or semipermanent fortifications. The latter term is more particularly applied to the fortifications constructed around an important city or other area which it is thought may become an object of attack on the part of an enemy, and which it is desired to hold at all hazards. They correspond to the permanent fortification applied in Europe to cities of similar importance, the main difference lying in the fact that the works are maintained in time of peace in the permanent system, while semipermanent works are allowed to fall into disuse upon the cessation of hostilities. These fortifications will be found discussed later under Permanent Land Fortification.

The main principle upon which field fortifications are based is the fact that men protected by them present but a small target to the fire of the enemy, whereas troops not so protected are exposed. This becomes of great importance at the ranges at which modern battles are fought. If held by a determined force they greatly increase the possibilities of the defense, and should the attacking force be defeated or become at all demoralized, would constitute a base from which the defenders could make a counterattack. They were largely used in the American Civil and Franco-Prussian and subsequent wars, many instances occurring where a force with their assistance has held in check one many times larger than itself. The general subject of field fortifications has been carefully treated in Fiebeger, *Text-Book on Field Fortifications* (New York, 1901), and *Engineer Field Manual* (Washington, 1907).

PERMANENT FORTIFICATION

Permanent defense or fortification is the art of strengthening in time of peace a position

which it is feared may become the objective of an enemy in time of war. Many of its principles are the same as those upon which field fortification is based. The essential differences result from the fact that the latter depend on the movements of an army and are constructed as their necessity becomes apparent, whereas in the former an attempt is made to foresee and to fortify the objective in time of peace. Such fortifications are constructed in advance because it is not believed that a defense commensurate with the importance of the interests at stake can be extemporized in time of war. The same care is used in the design and construction as in such permanent works of civil engineering as bridges, railroads, and tunnels. Especially must they be adapted to the probable form of attack and to the probable garrison available for serving them. As the result of improvements in material and in methods of attack, permanent fortifications eventually become obsolete in certain respects unless ameliorated to keep pace with these improvements. The essential principle to be kept in view is that the works should be ready to meet the attack when it comes.

A country having no coast line is, of course, subject only to attacks by land. One having a large seacoast rival and no military powers on its land frontiers is concerned primarily with seacoast defense. The two fundamentally different methods of attack give rise to two general subdivisions of the subject, viz, Land Fortification and Seacoast Defense. Most countries subject to both forms of attack require both methods of defense.

PERMANENT LAND FORTIFICATION

Historical Development. The art of fortification and the methods of attack which the fortifications have been constructed to resist or to supplement have developed together. Each improvement in one has found its counterpart in the other. In different countries the development has not always proceeded in exactly the same way. The constructions have been modified in accordance with the characteristics of the people and with the topographic features of the country. Probably the first attempt at defense consisted in the erection of fences or palisades of wood, intended to serve as physical obstructions to the advance of the attacking force. These appear in various shapes, sometimes being made of stakes driven into the ground and connected by wattling, sometimes by weaving together the branches of the natural growth of the woods, the entrance to the place being by tortuous and concealed routes. These wooden obstructions, which were subject to attack by fire and by battering and cutting tools, were sometimes further fortified by the addition of a second, and even a third, row of stakes. Later the space between these two lines was filled with earth (See STOCKADE). The next general step was the substitution of masonry for wood. These improvements were met by the attack with provisions for escalade. The walls were then increased in height, and escalade became extremely difficult. Batterings implements were developed for the purpose of making breaches in the bottom of the wall. These were met by placing earth in rear of the wall, bringing it up to within a few feet of the top, and furnishing a space for the movements of men at the top.

who could, by throwing missiles from above, interfere with the ordinary operations of the besieger at the bottom of the wall.

As the besieger became more pertinacious, this fire from above became of more importance, provision being made for extending platforms out, thus furnishing better positions from which missiles could be thrown down the face of the wall. Still further to facilitate the defense from above, towers were constructed at intervals, from which it was easy to hurl missiles along the face of the wall. These towers were sometimes made so that they could be isolated from the main portion of the wall and would not necessarily succumb to an enemy who had succeeded in reaching the top of the wall. The besieger, to cope with these means of defense, utilized covered timber passages to protect himself from the missiles from above. In this way he was enabled to reach and attack the wall with battering and other implements. As these alone became insufficient to overcome the increased resistance of the walls of defense, the besieger constructed high wooden towers from which he, in his turn, could hurl projectiles at the defenders on the walls. These towers were attacked by the defender with fire. To prevent them from being burned, the besieger covered them with rawhide. He also made use, either alone or in connection with these towers, of high banks of earth, which were gradually worked forward and higher. To meet these methods and render them more difficult of success, the defense surrounded the walls with large ditches, making provision where practicable for filling them with water at will.

The development of the various forms of bows and of catapults and other machines for throwing stones, etc., rendered the conflicts more severe and widened the area of contact between the defender and besieger. (See ARTILLERY.) Many of the walls constructed were most formidable in their proportions. They included sometimes entire cities. In other cases they were introduced as barriers to the approach of a large section of country, the greatest in length being the Great Wall of China. In Germany development occurred along somewhat different lines. More intricate protection was made in many places. Houses were developed into castles, which were placed in naturally inaccessible positions. They were gradually strengthened by many ingenious devices. The house was surrounded by a ditch, the only method of crossing which was by a drawbridge raised and lowered at pleasure from the castle. Devices such as machicolis, loopholes, and embrasures were provided along the outer wall, from which the defender could attack the assailant while being himself fairly well covered. The passage from the drawbridge to the interior could be barred by a portcullis, which was flanked by loopholed rooms. The interior of the castle was provided with a high tower or keep, capable of defense after the outer walls had fallen.

The foregoing represents, in general terms, the state of the art of fortification at the time of the invention of gunpowder. The general use of the latter caused many changes in the system of fortification, which gave rise, during the nineteenth century, to the development and modification of what is known as the bastion system of defense. This system has exercised such a powerful influence on the development of fortification that a brief account of its his-

tory will be of interest. The underlying principles of all fortification are unchangeable, but their application must, of necessity, be affected by every new invention of warfare, mechanical or strategical. Consequently while the bastion system, as a system, is practically obsolete, its basic features still remain, although in a modified form and on a correspondingly larger scale.

Much of the nomenclature of the art also had its origin in this system, although many of the terms are now applied to parts of forts which, in their present form, do not indicate the derivation of the word as originally applied. Reference has been made to the placing of towers at intervals along walls for the purpose of flanking the latter. These towers were either circular in plan or square, and were known as roundels. The portion of the wall connecting them was called the curtain. The introduction of artillery caused increased thickness and decreased height to be given to the walls, and the roundels were enlarged to permit the introduction of the large guns. With artillery the besieged possessed an advantage in that they could reach the besieger at a greater distance and could destroy the various material objects the latter had heretofore used in approaching the walls. The besiegers were obliged to discontinue their wooden constructions and substitute trenches of earth to protect them in their advances. They also constructed breaching batteries at a distance off from the walls for the purpose of playing on the latter, breaking them down and making breaches through which an entrance could be made to the fort. The approach was generally made towards a tower by zigzag trenches, but pointing, so far as possible, in such a direction as not to be subject to enfilade fire from any other part of the fort. Advantage was also taken of the fact that in the use of the roundels there were small areas called angles of dead space in front of the towers which could not be well covered by the fire from the tower itself. This led to an alteration of the plan to that of a pentagon, known as a *bastion*. One side of the pentagon was placed along the line of the wall. The angle farthest from the wall is known as the salient, the two sides adjacent to it as faces, the two sides connecting the faces with the wall as flanks.

This combination of a number of bastions connected with each other by curtains, the whole forming an enceinte, is the basis of the *bastion system*. The bastions were sometimes filled with earth to the grade where the guns were placed. The top surface of this filling was known as the *terreplein*. The length and direction of the faces, flanks, and curtain were such as to enable the ground in front of each portion to be flanked by the fire from some other part of the work. In front of the terreplein there was placed a wall originally breast-high and designated as the *parapet*. Ramps were inclined planes leading from the terreplein to the main level of the ground in rear, known as the *parade*. The general mass of the enceinte was sometimes called the *rampart*, and was of such a height as to afford the required protection to the materials and people in rear. On the outer side of the enceinte was the ditch. The front wall of the enceinte was the *scarp*. It was found that with this exposed to view the ditch could be reduced by the fire of artillery at a distance. The outer portion—i.e., the counterscarp—therefore, was

raised to such a relative height that the masonry of the scarp could not be breached except by batteries coming to the crest of the counterscarp. The ground in front of the counterscarp is the *glacis*. A depressed road, known as the *covered way*, running around the work on the counterscarp, was added.

As the weak points of the system were developed by attacks, efforts were made to strengthen them. A crescent-shaped work known as the *demilune* was placed in front of the curtain, and the ditch and covered way were extended around in front of it. To permit its faces better to be flanked, it was given the shape of a redan, and is now generally spoken of as the ravelin. The *redan* (qv) in its simplest form is constructed of two parapets of earth, built so as to form a salient angle, having the apex pointing in the direction of the enemy. It enabled the defense with its fire to enfilade and sometimes to take in reverse batteries which the besieger had succeeded in erecting on the counterscarp for the purpose of taking the adjacent bastions. It left, however, the curtain scarp exposed to distant fire. As a defense to this, a detached work, or *tenaille*, was constructed in the ditch in front of the curtain. The gates of the work were usually placed in the middle of the curtain, openings being made through the *tenaille* for the defenders to reach and return from the ravelin. The passageway through the ditch in front of the *tenaille* was sometimes protected with a small earthwork on either side. As the height of the parapet above the terreplein gradually increased, becoming a breastheight wall in name only, there was added immediately in rear a small earthen platform known as a *banquette*, on which the infantry troops could stand in delivering their fire. As a result of the increased power of guns, the length of each front increased. As the fire became more accurate, greater attention was paid to bringing a cross fire on every portion of the work outside of the enceinte. The bastions were enlarged at the expense of the curtains. Provision was made for works inside the fort, which could be held after the fall of the bastion itself. Those erected in the bastion proper were known as cavaliers. The function of the covered way was enlarged. The covered way itself was increased in size both at its salient and reentrance, the enlargements being known respectively as salient and reentrant *places of arms*. These served as rallying points for large numbers of defenders, who rushed out in sorties at times when it was thought a counterattack would most embarrass the besieger.

Palisades and other obstacles were introduced on the *glacis*. It was seen that as the fronts were made smaller and increased in number, the general outline of the work approached more nearly to a circle, the adjacent fronts came nearer to being on the same straight line and capable of supporting each other better in resisting attacks. More attention was given to the use of the most effective angles in the bastion and corresponding protection of the faces and flanks. Casemates were constructed in the flanks of the bastions for the better flanking of the ditches. To render it more difficult to enfilade the covered way, its crest was made *en crémaillère*. Short traverses were in some cases added. Redoubts were added in the ravelin. The accompanying illustration indicates

a typical arrangement of the bastion system towards the end of the eighteenth century (See Plate of FORTIFICATION, Figs 1, 1a, and 1b). The bastion system was used for many years, both for large and small works. In some instances the wall around a whole city, such as that of Paris, consisted of a great number of bastion fronts, while in other cases many small forts, containing all the essentials for their own defense, were constructed. An example of the latter is shown in the illustration of Fort Issy, one of the outer defenses of Paris.

It is not practicable in an article of this length to cite the names of the various engineers who were prominent in the development of the features of the system. It would, however, be incomplete without mentioning a few of the more celebrated. Albert Durer, the famous painter, is credited with great improvement in the development of roundels. It is not known who first suggested the change to bastions. Daniel Speckles, an engineer in Strassburg in the sixteenth century, devoted much thought to the development of the system and enunciated many principles, the force of which was not fully recognized until a century or more after his death. The system first became largely developed practically in Italy, and then throughout Europe, as a result of the fact that many Italian engineers were employed to develop the system of defenses in other countries. As the system was adopted elsewhere, characteristic national changes were made in it. In Spain the covered way, which is very essential where an active defense is desired, was little used and sometimes omitted. Provisions for delaying the besieger by more gradual retirement were increased, while those for actively attacking him were diminished.

In Holland the nature of the country led to the use of wide wet ditches. The lack of earth resulted in the use of lower parapets, the main one being sometimes supplemented by a lower one in front for the purpose of covering with its fire the wet ditch. The works were frequently increased in number and made of more complicated plan, rendering an attack more difficult by an assailant unfamiliar with the ground. One of Holland's most distinguished military engineers was Baron Coehoorn (qv). In France the art of fortification by the bastion system was reduced to precise rules. The first French author of prominence was Bar-le-Duc, who lived in the latter part of the sixteenth century. Marshal Vauban (qv), more generally known than any other engineer in any country as an exponent of the system, was a constructing engineer and a general rather than a writer. He is said to have actually besieged over 50 forts, built 35 new ones, and improved some 300 old ones. He also developed the use of ricochet fire and of parallels connecting at intervals the approaches for the attack of forts. The approaches afforded additional opportunities for the establishment of breaching batteries. Later came General Carmonaigne, who brought the bastion system to its most highly developed state.

Soon afterward ideas made their appearance which have since resulted in the development of simpler but stronger fortifications. Montalembert in France recognized the defects of the bastion system and took the position that a siege had become primarily an artillery contest. He proposed a large use of casemates, which

should protect the guns from covered fire. Instead of relying upon bastions in the salients for a flanking fire, he advocated the placing of low caponieres extending from the middle of each front into the ditch. His ideas did not meet with favor in his own country for many years, but were utilized and developed in Germany into what became known as the *polygonal system* of defense. In Sweden the habits and experience of the country led to the development of land fortifications similar to those of ships. The Swedes placed their guns in casemated batteries in two or more tiers for their land fortifications, as well as for coast defense. In Germany the bastion system had never met with

vanced example of its use in the enceinte of a large city is in the one constructed on the north, east, and south sides of Antwerp, Belgium. After the bastion and polygonal systems, what is known as the *tenaille system* was considered as the next most important type of construction. It consisted of a succession of redans joined to each other, giving an alternation of salient and reentrant angles. The main idea was that each face should flank the ground in front of the adjacent one. While stoutly advocated on theoretic grounds, the system was never largely applied in practice.

The many years of war at the beginning of the nineteenth century in Europe furnished a

FIG 8 FORT ISSY—A DETACHED BASTIONED FORT

great favor. It is here that we find the first extensive use of the polygonal system. The latter differs from the bastion system in the omission of the bastions and the prolongation of the main faces to the angles. It has the advantage of saving the labor and ingenuity sometimes required to find suitable locations for the various sides of the bastions. The main faces of the fort adapt themselves more readily to the site. A ditch is provided in front of the enceinte, and a caponiere—i.e., a casemated work—is pushed out from the middle of each face into the ditch, having a good flanking fire on the latter. It, in its turn, is protected from a distant fire by its relative lowness as compared with the covered way, or with a ravelin or other outwork placed in front of it. The system was used both for the construction of individual forts and of large enceintes surrounding great cities. Perhaps the most ad-

practical test of the fortification systems as they were in existence and developed their defects. It was found that the inclosed enceintes were not large enough to hold a sufficient number of troops and supplies. They were too close to the cities to protect the latter from bombardment as the range of the guns increased. They exercised little influence outside of the reach of their own guns, as they did not contain room enough for a garrison larger than needed for their own service. Unless a number of them surrounded the objective, the large armies simply ignored them by passing out of range of their guns in advancing on the main objective.

The scope of the fortification was, therefore, enlarged by building, in advance of the main enceinte, small forts containing all the elements of defense. A line of these forts located on the more critical points inclosed the ground necessary for the encampment of a large army.

The new system was known as that of *intrenched camps*. As greater use was made of curved fire, it became desirable to expose less and less masonry in the scarp walls of the individual forts. In the development of the system of intrenched camps the different countries used different designs for the small forts. As the range of the artillery guns increased, it became evident that the fate of the siege depended less and less on the small, carefully arranged niceties which had been of such value in earlier days. The outer works became simpler and stronger. As the range of the artillery was increased still further by the introduction of longer and more accurate guns, and of shells containing explosives, additional bombproof cover in which the defending troops could remain when off duty became more important. It was becoming possible for the defender to compel the attacker to use his batteries at a range nearer to that of ordinary vision. It was found that the high forts and traverses furnished him with an excellent target, and this led to attempts to render the forts more nearly invisible. They were made lower and their outer appearance harmonized more closely with the general surface of the ground. The fire of the guns was then found to attract the artillery fire of the attacker. The guns were taken out of the forts or redoubts and placed in batteries in the intervals between the forts, every attempt being made to conceal their actual position from the attacker.

The defense of Sebastopol in 1854 and 1855, the Civil War in the United States, and the Russo-Turkish War in 1877-78 showed the great value of works adapted to the site, simply and strongly built, with a view to meeting the latest phases of the attack.

The more recent introduction of smokeless powder still further emphasized the advantage of invisibility in the works. The redoubts have now become essentially a place for the development of infantry fire supplemented by machine guns, and in some cases small rapid-fire guns. The use of the interior enceinte is becoming less general as the outer line of batteries becomes stronger.

It is apparent that the art of fortification developed slowly but gradually and progressively for many centuries, but it has been within the last century and a half that radical changes have taken place. New conditions are constantly arising, and it is impracticable to indicate what the art will be in another century. Improvements have been made in recent years in range finders and in the methods of indirect fire control, enabling artillery to fire from hidden positions. Doubtless it will soon be necessary to take into more serious consideration the use of air craft. An interesting account of the development of the old-type fortifications is given in Viollet-le-Duc, *Histoire d'une forteresse* (Paris, 1873). A full account of the historical development of the various systems of fortification will be found in *Woolwich Text-Book of Fortification*, part II (London, 1893).

Modern Permanent Land Fortification. The modern system of permanent land fortification consists of the use of forts d'arrêt and of intrenched camps. The former are individual forts, complete in themselves, for small or medium-sized garrisons, and are placed for the protection of defiles, such as mountain passes, and of the frontier (See FRONTIER, MILITARY.) The intrenched camp, which has taken the place of

the old continuous enceinte as a fortification for cities and positions which it is desired to fortify in advance, consists primarily of an outer line of forts and batteries. The distance of this line from the city to be defended varies greatly in different places. Six thousand yards may be taken as a typical distance with modern artillery. The main conditions to be fulfilled in determining the distance are that the works shall be so far to the front that the city cannot be bombarded from any position outside of them without coming under their fire, and that they shall be far enough out to provide sufficient room in their interior for the movements of the army to occupy the place. The accidents of the ground generally control their exact position. A work will be withdrawn or pushed out considerably, as the case may be, for the sake of securing a commanding position. The forts or redoubts are now arranged essentially for a defense of infantry and machine-gun fire. They are placed at such distance apart along the circle as to enable them to be mutually supporting. Twenty-five hundred yards may be taken as a typical distance. Batteries for guns and howitzers are established in suitable positions in the intervals between them. The guns used rarely exceed 7 inches in calibre, howitzers of the same or slightly larger calibre are used. The batteries must be so placed that the guns can bear directly on assaulting troops.

There are differences in the practice and views of engineers in the various European countries as to the exact functions of the forts and batteries. According to the practice of some, no guns larger than six-pounders are mounted in the forts. An example of a typical fort on these lines is shown on the accompanying plate (Fig. 3). Others provide for placing larger guns in the forts themselves. The use of iron armor is advocated by some as protection for such guns. Cupolas for 5.9-inch guns, 4.7-inch guns, and for 8.2-inch rifled mortars were established in the triangular forts built for the defenses of Bucharest. It seems to be acknowledged generally that it is no longer desirable to maintain large guns behind ordinary parapets in the forts. It has not yet been settled, by war experience, whether it is better to keep them in the fort in cupolas or to take them out, placing them in detached batteries, probably the consensus of opinion is in favor of the latter method. The former certainly has the disadvantage that the besieger in attacking a fort attacks both the infantry and artillery of the defense. In general, the individual forts are designed for a garrison of about one battalion of infantry, an example of a typical battery being shown herewith.

It is intended to construct an infantry parapet in time of war across the intervals between the forts and batteries, sometimes running in front of them. Openings must of course be provided in this line to permit the egress of the troops making sorties. Arrangements are made for clearing the ground for some distance in front of the forts and batteries, and for the necessary accessories of the defense, including such artificial means as towers or balloons, to assist in observing the enemy's movements, searchlights with which to illuminate his works at night; and for the running of telegraph lines, roads, and railroads. In many cases it is the practice, instead of doing all these things in advance, to have projects prepared which include the most

up-to-date plans for them France, Germany, Russia, Austria, all have cities fortified on the above general lines. In many cases, however, the cities were first fortified earlier, and the present fortifications are modifications of the old ones, conforming as near as may be to the modern ideas. Most of the cities, in addition to being defended on the lines indicated, are provided with an interior enceinte, which is an additional security against surprise by any operation of the enemy's troops which may suc-

manent works of the Civil War, those used by the Turks at Plevna, and of some other works constructed only shortly before hostilities has caused much attention to be paid to the value of this class of works.

Blockhouses. In some countries—as, e.g., in the case of the Spanish in Cuba during the last insurrection—many towns were surrounded by blockhouses placed in commanding positions and within short distances of each other immediately outside the cities and towns. They

were also used in connection with the construction of the famous Trocha and in the vicinity of many sugar mills and other valuable properties. Much ingenuity was displayed in the construction of these houses, the system being developed probably more fully than ever before. They were sometimes frame structures, sometimes masonry, sometimes of boiler iron, and consisted of either one or two stories.

Blockhouses are well adapted for use where the enemy from whom the attack is expected is not provided with artillery of sufficient power to demolish them. They were largely used by the British in South Africa.

Bibliography. For fuller details on the subject of permanent land fortifications, the reader should consult Mahan, *Permanent Fortifications*, revised by Mercur (New York, 1887), Woolwich, *Text-Book of Fortification and Military Engineering*, part II (London, 1893), Lewis, *Permanent Fortification for English Engineers* (Chatham, 1890), Clarke, *Fortification* (London, 1907).

COAST DEFENSE

Coast defense, in its broadest sense, implies the defense of the coast against hostile attack. This may be made against fortified places by a hostile naval fleet, alone or in conjunction with a landing force; or a landing may be attempted in an out-of-the-way place by a large army brought in transports convoyed by naval vessels. The latter will probably not be attempted unless the fleet protecting the transports is stronger than any fleet by which it will probably be attacked. Such an attack must be resisted by a stronger army on shore and becomes, therefore, largely a problem in land warfare. Coast defense, which is discussed fully from the strategic and tactical point of view in another article (see COAST DEFENSE), as it is generally understood, has to do only with the resistance of attacks made by fleets. It generally resolves itself into an attack upon a harbor. This may be made for the purpose of securing control of the harbor as a base of operation and supply for the hostile fleet, or for the purpose of forbidding its use by the force of the country attacked, it may be to secure possession of naval docks, yards, and arsenals in the harbor, to prey upon commercial vessels, or to attack an inferior naval

ceed in forcing the outer line. Many engineers are of opinion that an interior enceinte is no longer necessary, that if anything be placed inside it should be simply in the nature of a palisade or similar work, to prevent surprise. Still, the fact remains that most of the cities fortified as intrenched camps have also the enceinte.

PROVISIONAL FORTIFICATION

Provisional fortification is the same in its function as permanent fortification. It is sometimes known as semipermanent fortification, sometimes as deliberate fortification. It is used either to complete a system of permanent works which are not complete when war breaks out, or to defend a totally new position that might have been provided with permanent works had it been known definitely that an attack was to be made. Probably the most notable and extensive use of provisional fortification was in the defenses of Washington during the Civil War. The interior cities of the United States are not defended by permanent land works. It is generally believed that they are not required for coping with any foreign foe likely to attack the United States. During the Civil War, however, when the country divided into two parts, the two capitals being so close together as Washington and Richmond were, it became of the utmost importance that Washington should be provided with strong fortifications. In general the forts were placed at intervals of about 1000 yards, and every prominent point was occupied by inclosed works, every important approach or depression of ground seen from the forts swept by field guns, and the whole connected by infantry trenches. The works were gradually constructed as the war went on, were carefully executed, provided with timber magazines for the ammunition, and with the necessary traverses, bombproof shelters, and other essential features. The success of the semiper-

fleet which has taken refuge therein. The problem varies greatly, depending upon the population of the country, the occupations of its people, its resources, and the extent of its coast line. France and Germany in the War of 1870-71 closed their ports for their own traffic as well as that of other countries and carried on their war entirely on land, neither being in a position to attack the other by sea. England, being largely dependent upon other countries for her food supply, is therefore bound, for the preservation of her existence, to protect her commerce on the seas. This policy imposes upon her the maintenance of an enormous navy, which was held for many years to be a sufficient protection against any attack that might be made on her shores. She has also, however, adopted the policy of fortifying her principal harbors. The problem for the United States is at the other extreme. She has an enormous coast line and a relatively small navy. It has been her policy to fortify her principal harbors, seacoast cities, railroad terminals, and navy yards, and to leave her navy as free as possible for offensive operation. Guns afloat have an offensive advantage over guns ashore because of their mobility, but for defensive purposes the guns on shore have corresponding advantages over those afloat. They are mounted much more economically, gun for gun, can be fired farther and more accurately, and cannot be ticked away from the place they are intended to defend. Under modern methods of mounting they present an extremely small exposure to the enemy, whereas the entire ship of the enemy becomes their target.

Historical Development. At the outbreak of the Revolutionary War few ports in the United States had been provided with fortifications such as had been built were small and weak earth forts. Throughout the early years of the war England's ships were comparatively free to come and go as they pleased, a notable exception being the instance of the repulse of the British fleet by a small fort on Sullivan's Island, Charleston harbor. Between the Revolutionary War and the War of 1812 some attention was given to the necessity for fortifying the coast, and a few defensive works were built. The best known of these to-day are Fort Jay (qv) and Castle William, on Governor's Island, New York harbor, which have endured to the present date, although now of little defensive value. During the War of 1812 the English blockaded New York and Boston, but were not able to occupy them, but the damage and demoralization caused by their depredations in Long Island Sound and Chesapeake Bay, to which was added the damage wrought on the city of Washington, produced a deep impression on the public mind as to the necessity for a regular system of fortification. Shortly after this war the general subject was carefully studied by the Board of Engineers of the Army, and work continued to be carried on under the comprehensive system which they inaugurated until the time of the Civil War. Many of the principles which they formulated are still applicable, the general principles underlying their plans, as stated, being as follows:

"The means of defense for the seaboard of the United States, constituting a system, may be classed as follows. First, a navy, second, fortifications, third, interior communications by land and water, and fourth, a regular army and well-organized militia. Fortifications must close

all important harbors against an enemy and secure them to our military and commercial marine, second, must deprive an enemy of all strong positions where, protected by naval superiority, he might fix permanent quarters in our territory, maintain himself during the war, and keep the whole frontier in perpetual alarm, third, must cover the great cities from attack, fourth, must prevent as far as practicable the great avenues of interior navigation from being blockaded at their entrances to the ocean, fifth, must cover the coastwise and interior navigation by closing the harbors and the several inlets from the sea which intersect the lines of communication, and thereby further aid the navy in protecting the navigation of the country, and sixth, must protect the great naval establishments."

Reference has been made to Montalembert and his influence upon the art of fortification in Europe. He had attracted particular attention to the utility of *casemates*, which were from that time forward freely used for many years in the flank defense of land fortifications. They were also deemed particularly applicable to seacoast works, and were used for this purpose in France, England, and Sweden. The first prominent example of their use in the United States was in old Castle William, which stands as a type of the masonry seacoast fortress of the early part of the nineteenth century. Where used for land fortification, the condition had been imposed that the masonry should not be exposed to the fire of guns, as its destruction was considered to be only a matter of time. The conditions covering the naval attacks of the period in question were, in certain respects, different. The ships were of wood and carried a large number of guns. The general idea of fighting consisted in bringing as many guns as were needed on land into a comparatively small space where the channels were narrow. The attack, instead of being a matter of weeks, as in land fortifications, was expected to be a matter of hours. The wooden sides of the ships were particularly vulnerable, and by putting the shore guns behind walls of stone they were in position to fire much longer than those on ships. The casemate lent itself to this style of defense, in that by using it the guns could be placed tier on tier, and even at narrow and restricted sites many guns could be emplaced.

The guns were usually mounted one to each casemate. The scarp wall in front was given a thickness designed to resist the projectiles then in use on ships. In the latter works this thickness was about 8 feet. The walls were thoroughly braced by the sides and tops of the casemates. Much study and attention was given to details, gradual improvements being made permitting a reduction in the size of the embrasures through which the guns were fired and an increase in their angle of fire. The guns were arranged in the more recent works for a traverse of 30° each way, making a total of 60°, which led to the construction of works in the shape of a hexagon. Guns on adjacent faces were enabled to fire parallel to each other when traversed to their extreme position, thus preventing the existence of a dead angle along the capital of the salients. Some of the works were of brick, others of stone. Most of them were provided with a land defense of some nature to assist the garrison in resisting an attack by a landing party. Many of the works are well known, such as Fort

Warren in Boston harbor, Fort Wadsworth, New York harbor, Fort Sumter, Charleston, and Fort Monroe, Hampton Roads.

About the time of the Civil War, however, there came radical changes in naval ordnance and attack. Rifled guns were introduced and ships were covered with iron. (See GUNS, NAVAL.) The wonderful effect of rifled-gun fire on masonry was shown in the breaching of Fort Pulaski during the Civil War by the breaching batteries established on land by the Federals under General Gilmore. As the war progressed, the Confederate engineers found it desirable to occupy some positions on the seacoast not already fortified. This was done with provisional works of sand and timber. The resistance made by a work of this character, Fort Fisher, near the mouth of the Cape Fear River, assisted in attracting attention to the value of sand as a defense. Steam had by this time been generally introduced into navies, affording ships more latitude in taking up positions.

These changes led to the introduction of armor in many cases for the protection of forts in Europe, it being argued that if good for the protection of ships' guns, it was good for the protection of forts, and that the latter could use as much of it as needed, whereas the ships were limited by the weight they could carry. In the United States the value of sand as a protection was appreciated. Immediately after the Civil War earthen batteries were built at important positions for mounting some of the smooth-bore guns then available. About 1875, appropriations ceased and little work except of repair nature was done on the fortifications of the United States until 1890. By this time the rapid strides which had been made along the lines already indicated—i.e., the introduction of steam into navies, the addition of improved varieties of armor, and the increase in accuracy and power of rifled guns—rendered the system of fortifications already built practically obsolete, except for certain minor purposes.

Modern Coast Defenses. The War Department having invited the attention of Congress to the condition of the national defenses and to the necessity for doing something to place them in better condition, an Act was passed in 1885 providing for the appointment of a board to examine and report at what ports fortifications or other defenses were most urgently required, the character and kind of defenses best adapted for each, with reference to armament and the utilization of torpedoes, mines, or other defensive appliances. The report of this board, since known as the Endicott Board, which was submitted the following year, forms the basis of the present system of fortifications in the United States. It recommended that defenses should be provided for the principal ports, which were arranged in the order of their relative urgency.

The defenses as to character and kind, with reference to armament, should be fixed and floating, one or both, according to locality, and armed with powerful cannon needed to repel attack from the most formidable ships. The shore batteries were to be armored turrets, revolving or fixed, armored casemates and emplacements in barbette. Earthen parapets and traverses, sometimes arranged with core of concrete or rubble masonry to add resistance to shock, were to be used for barbette batteries.

The Civil War had developed the value of the *submarine mine* as an element of defense. The

Endicott Board laid stress on this element as follows: "It is not generally considered possible to bar the progress of an armored fleet by the mere fire of the battery, some obstruction sufficient to arrest the ships within effective range of the guns is necessary. The kind of obstruction now relied upon is the torpedo in the form of a submarine mine and, except in special cases, exploded by electric currents, which are so managed that the operator on shore can either ignite the mine under the ship's bottom or allow the ship to explode it by contact. In deep channels the submarine mines are buoyant, in comparatively shallow waters they are placed upon the bottom, the object in both cases being to touch or nearly approach the hull of the vessel. Submarine mines are not accessories of the defense, but are essential features whenever they can be applied. Bombproof operating rooms and tunnels for the conveyance into the water of the electric cables are necessary parts of the system, and must be constructed in advance of the occasion for their use. Heavy batteries and submarine mines are correlative terms of a good defense from the shore. Without powerful guns in the defense the armored ships of the enemy would proceed deliberately to the removal of the mines, either ignoring or silencing the fire of the works, and without the aid of the mines the enemy's vessels could not generally be prevented from running past the batteries."

Special batteries of guns were to be installed for the defense of the lines of mines against the attempt of unarmored or light-armored boats to countermine or grapple for their attachments. When practicable, every mine field should be commanded by electric searchlights, so that the enemy's attempts at night to tamper with the mines may be detected and rendered abortive.

The necessities of each harbor were studied in the light of the best information available, and the board made definite recommendations as to the number of guns and mortars, submarine mines, electric lights, and local floating defenses necessary for each harbor.

The first fortification appropriation act designed to carry out the recommendations of the board was approved Sept. 22, 1888, since which time appropriations of varying amounts have been made regularly each year for carrying forward the adopted scheme of coast defense—for the manufacture of modern seacoast ordnance, the construction of gun and mortar batteries, for torpedo defenses, and for the necessary accessories.

The defensive details for each locality have since been elaborated in projects which have received the formal approval of the Secretary of War. These projects have from time to time been revised to keep pace with the changes in ordnance and ships' armament and construction. At the time the scheme of coast defense was formulated by the Endicott Board, the rapid-fire gun was in its infancy and ships were characterized by their extremely heavy armament and great thickness of armor. With the rapid development of this weapon and the increase in the resisting powers of armor by means of the Harvey and Krupp processes, there has followed a material change in ship construction, necessitating corresponding changes in the details of coast defenses. In accordance with the recommendations of the Endicott Board, the earlier detailed projects contemplated mounting a considerable number of the heaviest guns at

the more important harbors in armored works. The tendency towards a reduction in calibres of heavy guns, coupled with the adoption of a disappearing carriage (see illustration under COAST ARTILLERY) for the large guns, has, up to the present time, rendered armored defenses generally unnecessary in the United States, although many European governments stand committed to the construction of armored casemates and turrets for their land defenses. Rapid-fire guns were proposed in the earlier projects, but definite numbers or calibres were not assigned until 1896.

While the inauguration of the modern system of seacoast defenses for the United States dates from 1888, it was not until 1896 that Congress began making appropriations commensurate with the magnitude of the undertaking. Stimulated by the larger appropriations and the war with Spain the seacoast defenses of the United States were, in 1906, about 67 per cent completed. Twenty-five of the principal harbors of the United States possessed a sufficient number of heavy guns and mortars mounted to permit of an effective defense against naval attack. A considerable portion of the light rapid-fire emplacements and guns were completed, while a beginning had been made of inaugurating the systematic installation of fire-control systems and searchlight apparatus for night defenses. Torpedo material necessary to enable a quick and effective defense to be made was in store at each harbor for which torpedo defenses were projected.

Extensive torpedo experiments, resulting in the adoption of a new system, have been carried on at the School of Submarine Defense and elsewhere, and such experiments, as well as inventions or ideas submitted by individuals, are considered by the Torpedo Board.

The growth of the country, the improvements in ordnance and in battleships, the development of the system of submarine mines, and matters of government policy led to the necessity for a revision of the Endicott scheme. A new board known as the National Coast Defense Board was appointed by the President in 1905, and its report was made public in March, 1906. The board revised the list of places to be defended, reviewed the work already done, recommended the armament and accessories necessary to complete the defense, and furnished an estimate of the cost. Permanent seacoast defenses have been installed at the following localities in the United States: Kennebec River, Me.; Portland, Me.; Portsmouth, N. H.; Boston, Mass.; New Bedford, Mass.; Narragansett Bay, R. I.; eastern entrance to Long Island Sound, New York, N. Y.; Philadelphia, Pa.; Baltimore, Md.; Washington, D. C.; Hampton Roads, Va.; Wilmington, N. C.; Charleston, S. C.; Port Royal, S. C.; Savannah, Ga.; Key West, Fla.; Tampa Bay, Fla.; Pensacola, Fla.; Mobile, Ala.; New Orleans, La.; Galveston, Tex.; San Diego, Cal.; San Francisco, Cal.; mouth of Columbia River, Oreg. and Wash.; Puget Sound, Wash. Fortifications have been and are being constructed at Guantánamo, Cuba; Honolulu and Pearl Harbor, Hawaii; Manila and Subic bays, Philippine Islands; and at Colón and Panama in the Canal Zone. Additional defenses are to be constructed at some of these points and also at the entrance to Chesapeake Bay, Los Angeles, Cal.; San Juan, Porto Rico; and Guam if funds are provided by Congress. Some appro-

priations have also been made for modernizing the older emplacements in the United States.

Features of Construction. Large direct-firing guns are now usually mounted singly, with traverses between them to protect them from enfilade by distant hostile fire and to limit the destructive effects of projectiles landing in adjacent emplacements. The distances between the guns vary with their size and with the nature of the ground. Where possible, in the case of the larger guns, it is rarely less than 100 feet. Mortars for indirect firing are mounted in pits. The first requirement for the mounting of a modern gun is a proper foundation from which the gun may be fired and which will permit it to traverse freely and accurately. While modern guns, as already indicated, have increased remarkably in power in recent years, the weight of the gun proper has not increased in the same ratio. The usual precautions governing the design of foundations for heavy structures of course hold in the case of guns and mortars, in proportion to their weight. The great increase in power of modern guns has, in addition, rendered corresponding precautions necessary to prevent the gun and carriage from being overturned by the recoil of the piece. Provision is made for offsetting the strain transmitted to the foundation by the weight and distribution of the material of the latter. In the case of some of the high-power English guns this has resulted in the construction of practically solid concrete bases 25 feet in diameter and 10 feet deep. The traverse circle of the carriage is connected with this base by steel bolts two inches in diameter and extending nearly to the bottom of the base of concrete. A loading platform of suitable dimensions on which the men can work while loading the gun is provided in the rear of the gun. As modern ordnance is loaded at the breech the service of the gun is considerably expedited, and the gunners are enabled to work in more safety under the cover of the parapet. The latter is a matter of considerable importance and is placed in front of the gun, connecting with the traverses on the side. Where the gun is mounted on a disappearing carriage its muzzle projects over the parapet only in the firing position and recoils to a position in rear of the parapet for loading. If mounted on a barbette carriage, the gun stands permanently with its muzzle projecting above the parapet. (See illustrations in articles ORDNANCE and COAST ARTILLERY.) The thickness which should be given the parapet is an open question among engineers. The rule laid down by some of the best authorities is that it should be 50 per cent thicker than the greatest penetration of any projectile liable to strike it. The modern method of constructing parapets is to make them of a mass of sand supported in rear by thick retaining walls of concrete immediately in front of the gun. Projectiles striking in the front slope of a thick mass of sand thus backed will usually be deflected upward and pass out through the superior slope of the parapet, doing little damage to it, as the sand drops back approximately into place. Lewis gives the thickness of the concrete retaining wall immediately in front of the gun for English emplacements for high-power guns at from 10 to 15 feet. The superior or upper slope, both of concrete and earth, have a slight slope to the front. The front slopes run off into the natural surface of the ground and in this and other ways

FORTIFICATION

BATTERIES FOR UNITED STATES COAST DEFENSE

1. BATTERY OF 12-INCH GUNS MOUNTED ON DISAPPEARING CARRIAGES
2. BATTERY OF 6-INCH GUNS MOUNTED ON DISAPPEARING CARRIAGES Right gun in firing position, left gun in loading position

FORTIFICATION

1. SEACOAST BATTERY OF 15-POUNDER RAPID-FIRE GUNS AT A UNITED STATES COAST DEFENSE FORT
2. SEACOAST BATTERY OF 12-INCH MORTARS. Mortars shown in firing position and range-finding stations in the background

the concealment of the battery is secured in order to make it a difficult target for the enemy on the water.

The main magazine for a fort should consist of a building or buildings at suitable places convenient of access, in which powder in bulk, blank cartridges, shell, etc., may be stored. The service magazine at the gun emplacement should have a capacity for the ammunition immediately needed. At the time of the Civil War in the United States projectiles had not yet attained a weight too great to be handled by hand by two men. Now the largest of them weigh half a ton, and special appliances in the way of trolleys and wheeled trucks must be provided for handling them expeditiously. In view of the disastrous effects that may result from the explosion of a magazine, special precautions are taken to exclude hostile projectiles from it. This is accomplished by placing it in a relatively lower position than the gun and giving its walls an ample thickness of masonry and earth covering. Moisture is injurious to powder, and many precautions are taken to exclude dampness from the magazines. In view of the fact that the service magazines are of necessity near the coast, and that the air around them frequently contains much moisture, the problem is a difficult one. Careful attention is given to drainage, so that the surface water may be carried off as rapidly as possible. Air spaces and French drains are provided to intercept water penetrating the mass of the cover. The masonry walls are made as tight as possible and waterproofed. By these means the infiltration of water is prevented. Condensation will, however, occur when damp air is admitted to the magazine and strikes the walls and material at a temperature below its dew point. The prevention of condensation is a problem of relative heat and cold, and is usually met by attempts at careful regulation of the ventilation, admitting air so far as possible only at times when it is the driest. The walls are also sometimes lined with brick, with a view to absorbing water which may be deposited on them if the magazines must be opened for a short time at unfavorable periods.

In a modern fortification there are many elements to be considered. Living rooms for the cannoniers are built in the emplacements. Provision must be made for lighting the emplacements, magazines, etc., in case of action at night. This was formerly done by means of lamps, but recently in the United States electric light and power have been furnished in seacoast batteries. Lookouts for the observation of gun-fire must be built and the latest appliances for accurate fire control must be installed. Stairs and ramps are provided where necessary in the emplacement for free and easy communication between its various parts.

In the United States the regulations concerning the promulgation of information relative to the permanent works of defense are quite explicit and forbid the publication of many interesting and significant facts concerning the more modern fortifications. For descriptions of these fortifications, the reports of the Chief of Engineers of the army, including the reports of the district constructing officers, and the Drill Regulations for Coast Artillery should be consulted. For works of reference, aside from these official sources, consult: Abbot, *Defense of the Seacoast of the United States* (New York,

1888), Clarke, *Fortification* (London, 1907), Schwartz, *The Influence of the Siege of Port Arthur upon the Construction of Modern Fortresses* (Washington, 1908), Harvey, *The Castles and Walled Towns of England* (London, 1911), Thompson, *Military Architecture in England during the Middle Ages* (Oxford, 1912), Chatham manuals and the various service magazines. The use and disposition of troops is discussed under TACTICS, MILITARY, the methods of coast defense are treated under that title, while the various weapons used are described in such articles as ARTILLERY, ORDNANCE, TORPEDOES, COAST ARTILLERY, FIELD ARTILLERY, GUNS, NAVAL, HORSE ARTILLERY, RAPID-FIRE GUNS, ARMOR PLATE, PROJECTILES, COAST DEFENSE.

FORTIFICATIONS, ATTACK AND DEFENSE
The construction and nature of fortifications have been considered under FORTIFICATION, the present article will mention the tactics involved in their attack and defense. Many details of the subject are more appropriately treated under SIEGE AND SIEGE WORKS, but in some respects the tactics of field artillery (see TACTICS, MILITARY), with certain modifications, find application. The attack of a fortification is a planned attack on a prepared position, but the field material is supplemented by siege artillery and engineer work. The attack and defense proceed in many respects as in the attack of one army by another in the field.

The cavalry first incloses the fortification and remains in observation, the infantry then occupies its position deliberately, directing its forces against at least two of the fronts of the fortification, in order to deceive the enemy, preparing against surprise by means of very strong outposts, especially on the front, selected for actual attack, and the latter must generally intrench themselves, the siege guns are placed in position under its protection, the guns of the defender are if possible silenced, and the nearer means of defense are destroyed. The infantry can only advance under cover, consequently the outposts are first advanced and then their previous position is improved during the night to serve as an infantry position by constructing groups of fortifications previously laid out by the engineer officers. Where the infantry cannot be brought forward under natural cover, zigzag approaches must be run. If the infantry position is too far to the rear for the final assault, another and often a third position must be prepared farther to the front. If the heavy artillery fails to destroy the enemy's works flanking the ditch, the attacker will be forced to begin the tedious engineer attack by the sap. Otherwise the assault is ordered, and is preferably begun in the early morning, and the attack is directed on a broad front. Several false attacks are made at the same time, to deceive the enemy if possible. Meanwhile the infantry moves gradually forward, and if successful finally takes the position by storm. The work is carried on with energy, to prevent the enemy from having any rest in his work.

The same principles apply in the defense, activity and the offensive being predominant. In the early stages the infantry must go out in the open and may so cripple the attackers as to cause them to abandon the assault. If, however, the attack is successfully conducted, the defense becomes purely passive in the later stages. If the

attack of a fortification advances to the siege stage, it is evident, from the fact that they were unable to maintain a sufficient army in the field to drive back the invaders, that the defenders are usually at a disadvantage. The command of the fortified place under such circumstances usually involves many problems of government, including the food supply of the civilian inhabitants, as well as the proper command of troops. It plainly requires a man of ability and resourcefulness who must withal be possessed of a stout heart and great wisdom. If he cannot hold the place until relieved or until the close of the war comes, as the result of operations elsewhere, history shows that he may be subjected to a most critical judgment by his countrymen. See SIEGE AND SIEGE WORKS, MINES AND MINING.

FORT INDEPENDENCE. A fortification on Castle Island, Boston harbor, Mass., built on the site of the former Castle William.

FORTIS, for'tés, ALESSANDRO (1841-1909). An Italian statesman, born at Foilì. He studied law at Pisa and in 1867 fought under Garibaldi at Mentana. He became a radical leader, was arrested with Saffi and others during the elections of 1874, was elected to the Chamber of Deputies from Bologna in 1880, acted at first with the radical Republicans but in 1888 joined the dynastic party, and till 1890 was Undersecretary in the Ministry of the Interior. In 1898-99 he held the portfolio of Agriculture and Commerce in the Pelloux cabinet. He was Prime Minister and Minister of Interior from March, 1905, to February, 1906, his cabinet carrying through the purchase of railways.

FORTIS, for'tés, GIOVANNI BATTISTA, or ALBERTO (1741-1803). An Italian traveler and naturalist, born in Padua. He became an Augustinian monk, but spent his time in travel. His publications include *Saggio d'osservazioni sopra l'isola di Cherso ed Osero* (1771), *Viaggio in Dalmazia* (1774, Eng trans, 1778), his best-known work, containing an interesting collection of the folk songs of the Serbs and Croats, *Della valle vulcanico-marina di Roma* (1778), *Versi d'amore e d'amicizia* (1783), *Mémoires pour servir à l'histoire naturelle et principalement à l'oryctographie de l'Italie, etc.* (2 vols, 1802).

FORT JACKSON. A fort on the right bank of the Mississippi, 78 miles below New Orleans, famous for its resistance to Farragut's fleet and its final capture by the Federals in 1862. It was built in 1824-32 and was enlarged and repaired in 1841. After the passage of the South Carolina ordinance of secession, on Dec. 20, 1860, the State authorities of Louisiana seized these forts, strongly fortified them, and stationed a fleet above. In the spring of 1862 a Federal expedition was organized against New Orleans, and the Confederates, soon hearing of it, greatly strengthened the two forts. The expedition, under the command of Captain Farragut, arrived at the mouth of the Mississippi in March, and on April 18 the powerful mortar flotilla under Commander D. D. Porter opened fire with terrible effect upon the forts. At 2 A.M. on the 24th Farragut's fleet started in single line up the river, and in the face of a tremendous fire from the two forts and from a Confederate fleet succeeded in passing first Fort Jackson and then Fort St Philip. Soon afterward the city was occupied by Federal troops, and on the 28th both Fort Jackson and Fort St

Philip capitulated to Commander Porter, who had remained below. The two forts were under the command of Brig-Gen J. K. Duncan and were garrisoned by about 700 men each. Fort Jackson was under the immediate command of Lieut-Col Edward Higgins. The loss of the Federals was 37 killed and 147 wounded, while that of the Confederates is not definitely known. Consult Johnson and Buel, *Battles and Leaders of the Civil War*, vol. 11 (New York, 1887), Mahan, *Admiral Farragut* (ib, 1892), Nicolay and Hay, *Abraham Lincoln A History*, vol. v (ib, 1890).

FORT JAY. A United States military post, established in 1806 on Governor's Island, New York. The island, whose area recently has been increased by refilling the shallow water near its shores, contains the fort proper, garrisoned usually by a battalion of infantry, Castle William (military prison), and the headquarters of the Eastern Department of the First Division, and of the Military Service Institution of the United States. Governor's Island was first occupied by the Dutch, who called it Nutten Island, afterward, under the English rule, it was a perquisite of the royal governors, from which fact it derived its name. In 1710 it became a quarantine station. In 1775 the island was first fortified and occupied successively by the American and the British troops. From 1784 to 1794 it was used as a summer resort and racecourse. In 1800 the island was deeded to the United States by the Legislature, and in 1806 a permanent fortification was built upon the site of the original Fort Jay, an early earthwork. In 1812 the "South Battery" was added to the defenses. Extensive improvements were begun in 1901, which have comprised increasing the area of the island to about 103½ acres, the erection of new docks, numerous warehouses, additional barracks, and officers' quarters for the accommodation of a regiment of infantry. For illustration of Castle William, see FORTIFICATION.

FORT KENT. A village in Aroostook Co, Me, 200 miles north of Bangor, on the Bangor and Aroostook Railroad and on the Fish River (Map Maine, D 1). It contains the St Louis Convent, the Madawaska Training School, and several relics of the Aroostook War. Lumbering is the chief industry. Pop, 1900, 2528, 1910, 3710.

FORT KEOGH, kə't A former United States military post in Montana, established in 1876 and comprising a reservation of 57,600 acres. It was named for Capt. Myles Keogh, Seventh United States Cavalry, one of the victims of the Custer massacre.

FORT LAFAYETTE, la'fā-ét' A fort on the Long Island shore of the Narrows, New York harbor, in front of Fort Hamilton.

FORTLAGE, for'tla'ge, KARL (1806-81). A German philosopher. He was born at Osnabrück and was educated at Göttingen, Berlin, and Munich. He became a lecturer at Heidelberg in 1829 and later at Berlin, and in 1846 he accepted the professorship of philosophy at Jena. In his later writings he made psychology the basis of philosophy, thus following the teachings of Beneke and Fichte. His works include *Darstellung und Kritik der Beweise für Dasein Gottes* (1840), *Genetische Geschichte der Philosophie seit Kant* (1852), *System der Psychologie als empirische Wissenschaft aus der Beobachtung des innern Sinnes* (2 vols, 1855), *Beiträge zur Psychologie als Wissenschaft aus*

Spekulation und Erfahrung (1875) Consult Brasch, in *Unsere Zeit* (Leipzig, 1883)

FORT LAWTON A United States military post, located 6 miles from Seattle, Wash., and 2 miles from the railway station at Interbay. It was established in 1899 and in 1914 was garrisoned by a battalion of infantry besides being the headquarters of a regiment.

FORT LEAVENWORTH A United States military post in Kansas, established in 1827 by Colonel Leavenworth, U. S. A., as an outpost to protect the Santa Fe trail against Indians. The reservation is on the west side of the Missouri River and about 500 miles above the junction of the Missouri with the Mississippi, on the Kansas City, Wyandotte, and Northwestern and Missouri Pacific railroads. The station of the army-service schools, the United States Military Prison, and a large garrison usually comprising all arms of the service, are located at the post, which has both post office and telegraph station. A battalion of engineers is usually stationed here and a part of the military bridge equipment of the army.

FORT LEE A borough in Bergen Co., N. J., 15 miles north of Jersey City and opposite New York City, with which it is connected by ferry (Map New Jersey, E 2). It is situated on the Palisades and contains the Institute of the Holy Angels. The chief industries are the manufacture of piano actions and motion-picture films. Pop., 1910, 4472. In Revolutionary times it was one of the forts that defended the Hudson. On Nov. 20, 1776, General Greene with 2000 men narrowly escaped capture by a force of 5000 British under Cornwallis. He retreated with Washington across New Jersey, leaving many stores behind.

FORT LISCOMB A garrisoned post of two companies, situated on the northeast shore of Prince William Sound, 3 miles from Valdez, Alaska (Map Alaska, K 5).

FORT LOGAN A United States military post, established in 1889 and comprising a reservation of 640 acres, 3 miles from Denver, Colo. In 1914 it was a recruit depot.

FORT McALLISTER. A strong earthwork, erected by the Confederates during the Civil War on Genesis Point, on the right bank of the Great Ogeechee River, 6 miles from Osabaw Sound and 12 miles south of Savannah, Ga. Early in 1863 Admiral Du Pont, wishing to give the recently constructed monitors a preliminary trial before using them against Fort Sumter (qv), ordered the *Montauk* (Commander J. L. Worden), assisted by the gunboats *Seneca*, *Wissahickon*, *Dawn*, and *Williams*, to attack Fort McAllister. Bombardments occurred, without serious damage either to the fleet or the fort, on January 27 and February 28, the Confederate privateer *Nashville*, which had grounded near the fort, being destroyed on the latter day. On March 30 an eight-hour attack, with little effect, was made by the monitors *Passaic*, *Patapsco*, and *Nahant*, under Commander Drayton. Finally, on Dec. 13, 1864, the fort was assaulted and captured by General Hazen's division of General Sherman's army. The Union loss was 24 killed and 110 wounded, the Confederates losing about 50 killed and wounded. This was the concluding operation of Sherman's march to the sea and led to the surrender of Savannah several days later. Consult Ammen, *The Atlantic Coast* (New York, 1883), Johnson and Buel, *Battles and Leaders of the*

Civil War, vol. iv (ib., 1887), Sherman, *Memories*, vol. ii (ib., 1875).

FORT McDOWELL A United States military post located on Angel Island in the harbor of San Francisco, Cal. In 1914 it was a recruit depot.

FORT McHENRY A former United States military post, established in 1794. It occupied a reservation of 35 acres on Whetstone Point, Patapsco River, Md., 3 miles distant from Baltimore, Md. Its site was first occupied for military purposes in 1775. In 1791 it was established as a permanent fortification and was named after James McHenry, one of Washington's private secretaries during the Revolution, and Secretary of War, 1798. In September, 1814, it successfully withstood a bombardment by the British fleet under Admiral Cockburn. It was this attack which suggested to Francis S. Key his famous ode, "The Star Spangled Banner." During the Civil War the fort was used as a rendezvous and military prison. In 1906 there was an artillery garrison of one company, but, with the redistribution of coast artillery, it later was abandoned as a military post.

FORT MCINTOSH A United States military post in Texas, on the Mexican frontier, 1 mile distant from the city of Laredo, which is the post office, telegraph office, and railway station. It was garrisoned by a squadron of cavalry in 1914, while a regiment of infantry was stationed at Laredo.

FORT MCKINLEY A United States military post on Great Diamond Island, in the harbor of Portland, Me., of which it is an important element of the defense, garrisoned in 1914 by seven companies of coast artillery.

FORT MA'CON A fort commanding Beaufort harbor, N. C., taken by Federal land and naval forces on April 26, 1862.

FORT McPHERSON A United States military post, located 4 miles south of Atlanta, Ga., and garrisoned by a regiment of infantry.

FORT MADISON A city and the county seat of Lee Co., Iowa, 18 miles (direct) southwest of Burlington, on the Mississippi River, and on the Atchison, Topeka, and Santa Fe and the Chicago, Burlington, and Quincy railroads (Map Iowa, F 4). It is the seat of the State penitentiary and has the Cattermole Memorial Library, the Santa Fe and Sacred Heart hospitals, and several public parks. A fine railroad and wagon bridge crosses the river at this point. There are a pork-packing house, shops of the Atchison, Topeka, and Santa Fe Railroad, grain elevators, brickworks, cement-block works, foundries and machine shops, flour and saw mills, farm-implement works, wrapping-paper mills, heater works, and manufactures of overgaiters, buttons, boots, and shoes, furniture, canned goods, fountain pens, boxes, tools, etc. Fort Madison was settled in 1832, on the site of a fort dating from 1805, which was destroyed by fire in 1813; the town was incorporated in 1836. The government is administered by a mayor and a unicameral council. Pop., 1900, 9278; 1910, 8900, 1920, 12,066.

FORT MEADE A United States military post, on a reservation of 7842 acres, at Sturgis, S. D., on the Fremont, Elkhorn, and Missouri Valley Railroad. It was established in 1878 to protect settlers against Indian attacks. It was improved and modernized in 1902 and in 1914 was garrisoned by a regiment of cavalry.

FORT MEIGS, mēgz. A former fort at the

Maumee Rapids, in northwestern Ohio, famous for its defense by the Americans against the English and Indians during the War of 1812. It was built in February, 1813, by General Harrison, who had established his advanced post here after the "Massacre of the River Raisin" (see FRENCHTOWN), and about May 1, 1813, the British General Proctor, at the head of more than 2200 men (including about 1500 Indians under Tecumseh), began an attack, which lasted, with little intermission, until the 5th. On this day an American reinforcement of about 1100 men, under Gen. Green Clay, arrived, and a battle, or series of battles, ensued without decisive result. Proctor, however, seeing the hopelessness of further attack and being considerably weakened by Indian defections, withdrew from the vicinity of the fort on the 9th. Being ordered to take his supplies from the country, he returned again on July 20, but the restlessness of his Indians forced him to give up the attack and march on to the upper Sandusky. Consult Dawson, *Battles of the United States* (New York, 1858), Lossing, *Pictorial Field Book of the War of 1812* (ib., 1869), Slocum, *The Ohio Country between the years 1783-1815* (ib., 1910).

FORT MERCER. An abandoned fort at Red Bank, N. J., on the Delaware River, which during the Revolutionary War formed one of the defenses of the city of Philadelphia. Immediately after occupying Philadelphia, in 1777, Sir William Howe (qv) perceived the necessity of securing Forts Mercer and Mifflin, in order to open communication by water with New York and thus prevent the forcing of his army into a state of siege. Late in October, accordingly, a force of about 2500 picked men, mostly Hessians, under Colonel Donop, was sent against Fort Mercer, and a supporting fleet was ordered up the river. On the 22d the Hessians attacked with vigor, but were fiercely beaten back by the small American garrison, numbering 300, under Col. Christopher Greene, and were finally forced to withdraw. After the capture of Fort Mifflin (qv) Fort Mercer was abandoned (November 20) by the Americans and soon afterward was destroyed by the British. Consult Dawson, *Battles of the United States* (New York, 1858), and Lowell, *The Hessians in the Revolution* (ib., 1884).

FORT MIFFLIN. A fort on Mud Island, in the Delaware River, near the mouth of the Schuylkill River. It is one of the defenses of the city of Philadelphia and in American history is well known for its siege and capture by the British during the Revolutionary War. Together with Fort Mercer (qv), on the New Jersey shore, it controlled the approach by water to Philadelphia, and when that city was captured by Sir William Howe, in 1777, shut the British off from communication with their fleet and obstructed the passage of supplies. On October 23 it was bombarded for several hours, but with little effect, by a British fleet, assisted by a land battery, an American fleet (called the Pennsylvania Navy), under Col. John Hazelwood, cooperating with the fort, which was then garrisoned by only 300 men, under Col. Samuel Smith. Finally, the British erected a strong battery on Province Island and greatly reinforced their fleet. On the 10th of November they again attacked and after an almost constant bombardment for six days the Americans evacuated the fort and crossed over to Fort Mercer. The

British loss was 13 killed and 24 wounded, the Americans lost more than 10 times that number. An extended account of Fort Mifflin during the Revolution is given in Wallace, *An Old Philadelphia*, Colonel William Bradford (Philadelphia, 1884). Consult also Dawson, *Battles of the United States* (New York, 1858).

FORT MIMS, mīmz, MASSACRE OF. An Indian massacre on Aug. 30, 1813, during the Creek War, at Fort Mims, a temporary stockade 35 miles north of Mobile, Ala. On the outbreak of the war 553 men, women, and children had assembled here for protection, under the command of Dixon Bailey, but, although Bailey had been warned, they were surprised by a greatly superior force of Indians, under the half-breed Weathersford, at noon on August 30, and, though they offered brave resistance, all of them were killed, except 15, who escaped, and a few negroes and half-breeds, who were taken prisoners. Consult Pickett, *History of Alabama*, vol. II (Charleston, 1851), Lossing, *Field Book of the War of 1812* (New York, 1869), Dawson, *Battles of the United States* (ib., 1858).

FORT MONROE. A United States military post, situated at Old Point Comfort, Elizabeth City Co., Va., and commanding the entrance to Hampton Roads. It is the headquarters of the coast defenses of Chesapeake Bay. There are a post office and telegraph station at the post, which includes a reservation of 282 acres. The station of the Artillery School (postgraduate), with quarters for 100 officers and 900 men, is located here, 10 companies being stationed here in 1914. For two years after the close of the Civil War Jefferson Davis (qv) was imprisoned here.

FORT MONTGOMERY. A fort on the Hudson, near West Point, intended to close the river against the British fleet in 1777.

FORT MORGAN. A United States military post in Alabama, occupying a reservation of 322 acres on Mobile Point, the eastern entrance to Mobile Bay, 30 miles from Mobile. The post office is Mobile, and there is a telegraph station at the post. The garrison in 1914 consisted of two companies of coast artillery. See MOBILE POINT.

FORT MORGAN. A city and the county seat of Morgan Co., Colo., 70 miles northeast of Denver, on the Chicago, Burlington, and Quincy, and the Union Pacific railroads, and on the South Platte River (Map Colorado, F 1). It contains a monument on the site of the old fort, which at one time marked the Denver and Pike's Peak cut-off from the Overland trail. The industrial establishments include a beet-sugar factory, grain elevator, and flour mill. Stock raising is also carried on. The electric-light plant and water works are owned and operated by the city. Pop., 1900, 634, 1910, 2800.

FORT MOULTRIE, mōl'trī or mōl'-, often mōl'trī. A fort on Sullivan's Island, at the entrance to Charleston harbor, notable for its defense against the British in the Revolutionary War. In the summer of 1776 Sir Peter Parker, with a fleet, and Sir Henry Clinton, with a force of British regulars, proceeded to Charleston harbor for the purpose of taking Charleston and of using that place as a base of operations against the Southern Colonies. A total American force of about 6500 had assembled for the defense of Charleston, of which 435, under Col. William Moultrie, were stationed in an unfinished fort, then known as Fort Sullivan, at the eastern end

of Sullivan's Island. On June 28 Sir Henry Clinton took up a position on the sand bank near Sullivan's Island, with the intention of crossing over and making a land attack. Meanwhile Sir Peter Parker, with his fleet, made a vigorous attack on the fort, but, after an artillery duel lasting almost 10 hours, was forced to withdraw. Owing to the depth of the shoals, through which he had expected to reach Sullivan's Island, Clinton was detained on the sand bank and virtually took no part in the engagement. The effect of the victory was to insure the Southern States from invasion for almost two years. Subsequently the name of the fort was changed to Fort Moultrie. On May 7, 1780, a short time before the capture of Charleston by the British, the fort was forced to surrender.

Immediately before the outbreak of the Civil War, Fort Moultrie was occupied by the United States garrison assigned for the defense of Charleston harbor, but on Dec 26, 1860, the fort being virtually unprotected from land attack, and hostilities appearing imminent between the Federal and State forces, Major Anderson removed the garrison to Fort Sumter (q v). A detachment of South Carolina militia promptly took possession, and subsequently during the war Fort Moultrie formed one of the important defenses of Charleston against Federal attacks. Consult Dawson, *Battles of the United States* (New York, 1858), Doubleday, *Reminiscences of Forts Sumter and Moultrie in 1860-61* (ib, 1876), McCrady, *History of South Carolina in the Revolution, 1775-80* (ib, 1901).

FORT MYER A United States military post in Virginia occupying a reservation of 186 acres on the west bank of the Potomac River, opposite Washington, D C, which is the telegraph station. There are a post office and telephone at the post, which was named after Gen A J Myer, the founder of the Signal Service, U S A. Here were quartered in 1914 a squadron of cavalry and a battalion of field artillery.

FORT NIAGARA A fort at the mouth of the Niagara River, on the American side. La Salle seems to have built a house here in 1669, and a fortified trading post, called Fort Conti, 10 years later, but both were soon destroyed. In 1686 Denonville built here a fort, which was named in his honor. Soon afterward this place was besieged by the Senecas. In September, 1688, the fort was destroyed and abandoned, but in 1725-26 Vaudreuil built here another fort, called Fort Niagara, which was destined to be more permanent, and which was soon recognized, not only as the most important military station on the Great Lakes, but also as perhaps the greatest trading post in the country. During the French and Indian War it was the objective point of a futile expedition under Governor Shirley of Massachusetts in 1755, and in July, 1759, after a siege of about 16 days, was captured by a British and Indian force under Sir William Johnson. In July 1764, important treaties were made here by Sir William Johnson with various Indian tribes who had participated in Pontiac's War. During the Revolutionary War the fort was the starting point of many expeditions sent to ravage the Western frontier, was the headquarters for a time of John Butler and Joseph Brant, and was the place where the Wyoming and Cherry Valley expeditions were organized. Finally, in August, 1796, it was evacuated by the British, in accordance with the Treaty of 1783, and was immediately occupied

by an American garrison. It was bombarded from Fort George (q v), on Oct 13-14, 1812, was captured by the British on Dec 19, 1813, and was again surrendered to the United States on March 27, 1815. In May, 1826, various circumstances having combined to make the fort relatively unimportant from a military point of view, the United States garrison was wholly withdrawn. Consult Porter, *A Brief History of Old Fort Niagara* (Niagara Falls, 1896), Marshall, *The Niagara Frontier* (Buffalo, 1865), Severance, *Old Trails on the Niagara Frontier* (2d ed, ib, 1903), Emerson, *The Niagara Campaign of 1759* (2d ed, ib, 1909).

FORT NINETY-SIX (S C) See NINETY-SIX.

FORT O'GLETHORPE A United States military post at Dodge, Ga., near Chickamauga Park and 11 miles from Chattanooga, Tenn., garrisoned in 1914 by a regiment of cavalry.

FORT ONTARIO, ɔn-tā'ri-ō A United States military post at Oswego, N Y, which is the nearest post office, telegraph, and railway station. It is usually garrisoned by a battalion of infantry.

FORTOUL, fôr'tool', HIPPOLYTE NICHOLAS HONORÉ (1811-56) A French author and statesman. He was born at Digne and became a professor of the history of literature at Toulouse in 1845 and at Aix in 1846. In 1849 he was elected deputy from the Department of Basses Alpes and joined the party of Louis Bonaparte. After a few weeks (October 28-December 2) in the Ministry of Marine, he became, on the coup d'état, Minister of Public Instruction and did his best to serve the new régime, especially in carrying out the Law of 1850, in its narrow opposition to the university. He stopped the courses of Jules Simon at the Sorbonne and retired Quinet and Michelet from the Collège de France, suppressed the chair of philosophy and replaced it by a chair in logic, and introduced the quasi-elective system of bifurcation, or choice between science and letters. This plan, and the introduction of practical features—farming in the primary schools and drawing in the lycées, e g—were the only points in which Fortoul showed himself an educator and not a mere politician. As an author, he opposed romanticism, notably in his novel *Grandeur de la vie privée* (1838). He also wrote *L'art en Allemagne* (1841), and *Etudes d'archéologie et d'histoire* (1854).

FORT PAYNE A town and the county seat of De Kalb Co, Ala, 92 miles northeast of Birmingham, on the Alabama Great Southern Railroad (Map Alabama, D 1). It has coal and iron mining interests, and among its industrial establishments are brick and coopers plants and a hosiery mill. Pop, 1900, 1037, 1910, 1317.

FORT PICKENS A fort on Santa Rosa Island, Fla., commanding the entrance to Pensacola harbor, and intended as a defense to the harbor and the United States Navy Yard at Warrington. Early in 1861, at the outbreak of the Civil War, it was under the command of Lieut Adam J Slemmer (q v), who transferred hither the small garrison of Fort Barrancas, directly opposite, and with a force numbering only 81 withstood for some time a siege by a large force of Confederates under Gen Braxton Bragg (q v). Federal reinforcements, under Col Harvey Brown, arrived in the middle of April to relieve Slemmer and his garrison, and the fort was held by the Federals throughout the war.

FORT PILLOW A fort in Tennessee, on the east shore of the Mississippi River, about 40 miles north of Memphis, the scene of the so-called "Massacre of Fort Pillow" during the Civil War. It was constructed by the Confederates, under the direction of General Pillow, in the spring of 1862, but was abandoned and dismantled by them on May 25 of the same year and on June 5 was occupied by a small Federal force. Subsequently it was a starting point for a number of Federal raids, but was regarded as of relatively little strategic importance and was never strongly garrisoned. On April 12, 1864, it was attacked by a strong Confederate force under Gen Nathan B Forrest (qv). After offering a stubborn resistance, prolonged even when capture had become inevitable, the garrison was overpowered and almost annihilated. The Confederates were accused of having deliberately massacred the Federals, fully half of whom were negroes, after the latter had surrendered, and color was given to the charge by Forrest's summons to surrender, which closed with the words "Should my demand be refused, I cannot be responsible for your command." The testimony, moreover, of the survivors almost unanimously confirmed the charge. On the other hand, Forrest and his officers always asserted that the resistance of the garrison was insanely and recklessly prolonged, that the garrison never surrendered, that the Confederates ceased firing as soon as one of their own officers had cut down the United States flag, and that no prisoners, white or colored, were killed or maltreated. President Lincoln, while believing that a massacre had been perpetrated, was convinced it had neither been ordered nor suggested by Forrest. The Confederate loss was 20 killed and 60 wounded. Consult Johnson and Buel, *Battles and Leaders of the Civil War*, vol iv (New York, 1887), Nicolay and Hay, *Abraham Lincoln A History*, vol vi (ib, 1890), Wyeth, *Life of General Forrest* (ib, 1899), Mathes, *General Forrest* (ib, 1902), in the "Great Commanders Series."

FORT PLAIN A village in Montgomery Co, N Y, 38 miles southeast of Utica, on the New York Central and Hudson River Railroad, and on the Barge Canal (Map New York, F 5). There are knitting and silk mills, machine shops, furniture factories, creameries, wagon works, and manufactories of pianos, metal wheels, and condensed milk. These are greatly facilitated by abundant water power. The village owns its water works. Pop, 1900, 2444, 1910, 2762.

FORT PORTER. A United States military post, established in 1867. Originally, in 1844, there was a defensive work at Black Rock. At the fort a battalion of infantry was stationed in 1914.

FORT PREBLE, prēb'1 A United States military post, established in 1808 and occupying a reservation of 24 acres at Spring Point, on the east side of Portland harbor, Me, 2 miles from the city of Portland, which is the post-office and telegraph station. Its garrison in 1914 was a detachment of coast artillery.

FORT PULASKI. A fort erected on Cockspur Island, Ga, for the defense of the Savannah River. It was occupied by the Confederates at the beginning of the Civil War, and on April 11, 1862, after a vigorous bombardment, was captured by the Federals, its garrison then numbering 350 men, under Col Charles H Olmstead.

FORTRESS. Sometimes popularly, though never in the United States officially, used for fort (qv). In English textbooks the word "fortress" is still employed to designate a large permanent fortification, permanently garrisoned, and usually including several forts. See FORTIFICATION.

FORTRESS ARTILLERY is *artillery of position*, consisting of guns permanently mounted in fortifications, either land or sea, and is thus distinguished from *mobile artillery*, consisting of guns designed to accompany or to follow armies in the field. In the United States the Coast Artillery Corps is charged with the care and use of the fixed and movable elements of land and coast fortifications. See COAST ARTILLERY, ORDNANCE.

FORTRESS MONROE See FORT MONROE.

FORT RILEY An army post located on the United States military reservation of Fort Riley, consisting of 19,447 acres, situated on the Kansas River, about 3½ miles from Junction City in Geary Co, Kans. The post office, telegraph, and railroad station are at the post of Fort Riley. The post was first known as Camp Centre, being near the geographical centre of the United States, but was subsequently named after Gen B C Riley, U S A. The garrison consisted in 1914 of a regiment of horse artillery and a regiment of cavalry. The Mounted Service School is also located at Fort Riley.

FORT ROBINSON A United States military post, on White River, 3 miles from Crawford, Neb. There are a post office and telegraph station at the post, which has quarters for 520 men and cavalry stables for 530 horses. It was established in 1874 and occupies a reservation of 20 square miles. Its garrison in 1914 was two troops of cavalry.

FORT ROYAL See FORT DE FRANCE.

FORT ST. MICHAEL. A garrisoned post of two companies on St Michael Island, Alaska (Map Alaska, F 4). It is the southern terminus of the Nome wireless system of the Signal Corps.

FORT ST PHILIP See FORT JACKSON.

FORT SAM HOUSTON, hū'stən A United States military post, established in 1865, as the post of San Antonio, Tex, and occupying a reservation of 469 acres, near the city of San Antonio, which is the telegraph station. It is a valuable strategic point on the southern frontier. There is a post office at the post. In 1914 it was garrisoned by a regiment of cavalry and three batteries of field artillery.

FORT SCHUYLER, ski'ler See FORT STANWIX, ROME, N Y.

FORT SCHUYLER A United States military post, which forms one of the defenses to the northern entrance to the harbor of New York. The post was established in 1856, although the fortification was begun in 1833. The reservation comprises 52 acres, on Throgg's Neck, Long Island Sound, 3½ miles from Westchester Station, New York City, which is the post office and telegraph station. The garrison in 1914 was a detachment of coast artillery.

FORT SCOTT A city and the county seat of Bourbon Co, Kans, 98 miles south of Kansas City, on the St Louis and San Francisco, the Missouri, Kansas, and Texas, and the Missouri Pacific railroads, and on the Marmaton River (Map Kansas, H 7). It has a Carnegie library and Mercy Hospital. The city is in a region of great mineral wealth, deposits of coal, flagstone,

cement rocks, clays, mineral paints, zinc, and lead being found. There are foundries and machine shops, flouring mills and grain elevators, railroad shops, overall factory, cement, pottery, brick, and tile works, and manufactories of sirup, harness and saddlery, medicines, etc. Fort Scott has adopted the commission form of government. The city owns its water works. Pop., 1900, 10,322, 1910, 10,463, 1914, 10,522, 1920, 10,693.

FORT SHERIDAN. A United States military post, established in 1887, in the State of Illinois, on Lake Michigan, about 25 miles from Chicago. The reservation comprises 632 acres. There are a post office and telegraph station at the post, which has quarters for infantry, cavalry in large numbers, and field artillery.

FORT SILL. A United States military post in Oklahoma, situated on the Chicago, Rock Island, and Pacific Railroad, a railway station, telegraph, and post office being located at the fort. Here in 1911 was established a school of fire for field artillery which is attended by officers of the regular army and militia. A number of batteries (five in 1914) and the headquarters of a field artillery regiment usually form the garrison.

FORT SLOCUM. A United States military post on Long Island Sound off New Rochelle, New York, from whose railway station it is 2 miles distant. There are a post office and telegraph station at the post, which is occupied as a recruit depot. Its armament consists of mortars and rapid-fire guns.

FORT SMITH. A city and one of the county seats of Sebastian Co., Ark., at the junction of the Arkansas and Poteau rivers, and on the St. Louis and San Francisco, the Arkansas Central, the Midland Valley, the Kansas City Southern, the Fort Smith and Western, and the St. Louis, Iron Mountain, and Southern railroads (Map Arkansas, A 2). Four steel bridges span the rivers at this place, and among other noteworthy features are the United States courthouse and post office, the Peabody public school, St. Anne's Academy, high-school building, Carnegie library, city park, three hospitals, the old fort, and a national cemetery. Fort Smith has important wholesale-jobbing interests in groceries, meats, dry goods, drugs, furniture, leather goods, etc., a large trade in coal, corn, cotton, lumber, live stock, and hides; and extensive manufactures of furniture and wagons. There are also saw and planing mills, cottonseed-oil mills, iron and steel rolling mill, and manufactories of brooms, stoves, wheelbarrows and drays, overalls, refrigerators, etc. Settled in 1838, Fort Smith was first incorporated in 1842 and was chartered as a city of the first class in 1886. It adopted the commission form of government in 1913. The city owns its water works, which cost \$1,000,000. Pop., 1900, 11,587; 1910, 23,975, 1914 (U. S. est.), 27,136, 1920, 28,811.

FORT SNELLING. A United States military post in Minnesota, at the junction of the Minnesota and Mississippi rivers, 7 miles from St. Paul and 8 miles from Minneapolis. It was established in 1820 as an outpost in the Indian country, and embraces a reservation of 1531 acres. There are a post office and telegraph station at the post, which was named after Col. Josiah Snelling, U. S. A., its first commander. Its garrison in 1914 was a battery of field artillery, though there are quarters for a larger body.

FORT STANWIX. A fort built in 1758,

by Brigadier Stanwix, on the site of the present Rome, N. Y., and near the spot where another fort, soon abandoned, had been built in 1756. From its location on the watershed between Lake Ontario and the Hudson, it commanded the principal line of communication between New York and Upper Canada. Here, in the fall of 1768, a treaty was negotiated by Sir William Johnson with the Six Nations, about 3200 Indians being present. The latter agreed, for the sum of \$10,000 in money and goods, to surrender their title to a vast tract of territory which now constitutes Kentucky, West Virginia, and the western part of Pennsylvania. Soon afterward the fort was dismantled, but in 1776 it was rebuilt and named Fort Schuyler, in honor of Gen. Philip Schuyler. In the following year Col. Peter Gansevoort, with a garrison of about 750, held it from August 3 to August 22 against St. Leger, with a force of about 1700 British regulars, Tories, and Indians. The fort was destroyed by flood and fire in 1781, but was subsequently rebuilt again as Fort Stanwix, and here, on Oct. 22, 1784, Oliver Wolcott, Richard Butler, and Arthur Lee, acting on behalf of the Continental Congress, negotiated an important treaty with the Six Nations. Consult W. M. Sloane, *The French War and the Revolution* (New York, 1901).

FORT STEPHENSON. See FREMONT, Ohio.

FORT STEVENS. A United States military post, in Clatsop Co., Ore., 110 miles from Portland, on the Spokane, Portland, and Seattle Railroad, and at the mouth of the Columbia River (Map Oregon, A 1). It was established in 1864 and includes a reservation of 1250 acres. In 1914 the post had as a garrison three companies of coast artillery. The electric-lighting plant is owned by the Federal government. Pop., 1914 (local est.), 500.

FORT STRONG. A United States military post, on the east end of Long Island, Boston harbor, Mass. The garrison consists of four companies of coast artillery, and Fort Standish is connected as a subpost.

FORT SUMTER. A fort on an island at the entrance of Charleston harbor, about 3 miles from Charleston, the firing upon which by the Confederates, in April, 1861, precipitated the Civil War. Work was begun on the fortifications about 1830, but was subsequently discontinued, and in 1860 the fort was still in an unfinished condition. For illustration, see Plate of FORTIFICATIONS. On November 21 Major Robert Anderson replaced Col. J. L. Gardner as commander of the forts in Charleston harbor and, like his predecessor, occupied Fort Moultrie (qv). Hostilities with the State forces appearing imminent, however, and Fort Moultrie being almost wholly unprotected against land attacks, he secretly removed his small garrison to Fort Sumter, on the evening of December 26—six days after South Carolina had passed her ordinance of secession. Anderson and his small garrison applied themselves with energy to the strengthening of the fortifications. After much vacillation on the part of the administration at Washington, an attempt was made in January, 1861, to relieve the scantily provisioned fort, but the *Star of the West*, a merchant vessel which had been sent for this purpose, and which arrived at the mouth of the harbor early on the 9th, was fired upon by the authorities and forced to put back. After the inauguration of President Lin-

coln the policy to be pursued with regard to Fort Sumter was the subject of many cabinet discussions and, in large part, of the unofficial negotiations between Seward and the Confederate commissioners in Washington (See CONFEDERATE STATES OF AMERICA) On April 9 President Lincoln notified Governor Pickens that an attempt would be made to send provisions to the fort, and on the 11th, acting under orders from President Jefferson Davis, General Beauregard, in command of the Confederate forces at Charleston, demanded the evacuation of the fort Anderson promptly refused to withdraw, though, after a prolonged conference with his officers early on the 12th, he wrote "I will evacuate Fort Sumter by noon on the 15th instant, and I will not in the meantime open my fires upon your forces, unless compelled to do so by some hostile act against this fort or the flag of my government, should I not receive prior to that time controlling instructions from my government or additional supplies" This answer proved unsatisfactory, and the bombardment of the fort began at 4 30 A.M., though Anderson did not return the fire until 7 o'clock Meanwhile, on the same morning, the relieving fleet sent by President Lincoln arrived at the mouth of the harbor, but was able to accomplish nothing The artillery duel continued throughout the 12th, and during the morning and part of the afternoon of the 13th, when terms of evacuation were agreed upon between Anderson and Beauregard, the garrison, which consisted of only 128 men, leaving the fort on the following day with the honors of war There was no one wounded or killed on either side during the bombardment The contest was of immense importance, since it marked the beginning of the Civil War and put a stop to all peace plans and negotiations

After taking possession the Confederates greatly strengthened the fort, both for offensive and defensive operations On April 7, 1863, a Federal fleet of nine ironclads—the *Weehawken*, *Passaic*, *Montauk*, *Patapsco*, *New Ironsides*, *Catskill*, *Nantucket*, *Nahant*, and *Keokuk*—under Admiral Dupont attacked the fort with great energy and gallantry, but after an engagement of about two hours and a half was repulsed, the *Keokuk* sinking on the following day, and several vessels being considerably damaged General Gillmore, the commander of the land forces engaged against Charleston, established breaching batteries on Morris Island, and after a seven days' bombardment, Aug 17–23, 1863, virtually reduced the fort to ruins Thenceforth it was garrisoned only by a small force of infantry, which held it in spite of frequent bombardments, a gallant boat attack made by a force of 400 men under T H Stevens, on the night of Sept 8, 1863, and of a disastrous magazine explosion on Dec 11, 1863, until Feb 17, 1865, when it was finally evacuated During 1863–65 Fort Sumter was commanded successively by Colonel Rhett, Major Stephen Elliott, Capt J. C Mitchell, and Capt T A Huguennin On April 14, 1865, by order of Secretary Stanton, General (formerly Major) Anderson raised over the fort the same flag which he had been forced to lower exactly four years before Consult *Official Records*, Johnson and Buel, *Battles and Leaders of the Civil War*, vols I and IV (New York, 1887), Anderson, *Political Conspiracies Preceding the Rebellion; or, The True Stories of Sumter and Pickens* (ib, 1882), Crawford, *Genesis of the Civil War The Story of Sumter*,

1860–61 (ib, 1887), Doubleday, *Reminiscences of Forts Sumter and Moultrie in 1860–61* (ib, 1876), Gillmore, *Report on Engineer and Artillery Operations Against Charleston in 1863* (Washington, 1865), Rhodes, *History of the United States from the Compromise of 1850*, vol III (New York, 1895)

FORT TERRY A United States military reservation of 150 acres, on Plum Island, between Long Island Sound and Gardiner's Bay, N Y The post office and telegraph station are at New London, Conn, 13 miles distant The works are garrisoned by six companies of coast artillery

FORT THOMAS, tōm'as A United States military post, established in 1887, consisting of a reservation of 280 acres (including a rifle range of 169 acres) It is situated in Kentucky, on a bluff overlooking the Ohio River, 3 miles from Newport, Ky, and 4 miles from Cincinnati There are a post office and telegraph station at the post The garrison in 1914 was two battalions of infantry

FORT TOT'TEN This United States military post, for many years the headquarters of the Battalion of Engineers, was established in 1862 and was originally called Willets Point The reservation comprises 136 acres on the East River at the western end of Long Island Sound, 2½ miles from Whitestone The post is the station of the School of Submarine Defense and is the torpedo depot It is one of the defenses of the northern entrance to New York harbor and is the headquarters for the coast defenses of eastern New York Seven companies of artillery were stationed here in 1914

FORT TRUMBULL A former United States military post, established in 1839 and occupying a reservation of 13 acres on the south side of New London harbor, Conn In 1777 a small redoubt by this name, and another in 1812, occupied this site

FORTUNA (Lat, from *fors*, chance, probably connected with *ferre*, to carry In this view Fortuna is the "bringer" of good or evil fortune) In classical mythology, the goddess of chance, called by the Greeks Tyche According to Hesiod, she was a daughter of Oceanus, according to Pindar, a sister of the Parca She differed from Destiny or Fate in so far that she worked without law, giving or taking away at her own good pleasure and dispensing joy or sorrow indifferently She had temples at Smyrna, Corinth, and Elis In Italy she was extensively worshiped from a very early period and had many names, such as *Patricia*, *Plebeia*, *Equestris*, *Virilis*, *Primigenia*, *Publica*, *Privata*, *Muliebris*, *Virginensis*, etc, which indicate the extent and also the minuteness of her superintendence Particular honors were paid to her at Antium (Horace, *Odes*, I, 35) and at Præneste, in the temple of the former city two statues of her were even consulted as oracles The temple of Fortuna Primigenia at Præneste was consulted especially by women, who sought to learn the fate of their first-born children (*primigeni*) Her worship was said to have been introduced in Rome by Servius Tullius Greek poets and sculptors generally represented her with a rudder, as a symbol of her guiding power, and with a cornucopia, as a symbol of prosperity, or with a ball, or wheel, or wings, as a symbol of her mutability Consult Fowler, *Roman Festivals* (London, 1899), and Wissowa, *Religion und Kultus der Römer* (2d ed, Munich, 1912).

FORTUNATÆ IN'SULÆ See CANARY ISLANDS

FORTUNATE ISLANDS See ISLANDS OF THE BLESSED

FORTUNATIANUS, ATRILIUS A Roman grammarian, probably of African birth, who in the fourth century A.D. wrote a treatise on the metres of Horace (qv). Prefixed to the discussion of the Horatian metres is an account of the basic ideas of metre in general and of the rules of prosody. For the treatise, see Keil, *Grammatici Latini*, vol. vi. Consult Teuffel, *Geschichte der römischen Literatur*, vol. iii, §405 3 (6th ed., Leipzig, 1913).

FORTUNATUS The chief figure of a popular tale, or rather collection of tales, centering about the fortunes and misadventures of Fortunatus and his sons with a wishing cap and an inexhaustible purse, which prove their possessor's ruin. Many of the materials are ancient, apparently Oriental, but the composition is German of about 1450. *Fortunatus* was first printed at Augsburg in 1509 (reprinted in Simrock's *Deutsche Volksbücher* (1846), and often afterward in German, French, Italian, Dutch, English, Danish, Swedish, Icelandic. It was dramatized by Hans Sachs (1553) and in English by Thomas Dekker (1600), whose play, *The Pleasant Comedie of Old Fortunato*, was turned back into German in 1620 and continued its influence in Germany for two centuries. The best modernization of the story is by Tieck (qv) in *Phantasus* (1816). Uhland left an unfinished narrative poem on Fortunatus, and the idea was used by Chamisso in his *Fortunati Glucksackel und Wunschhütlein*. Consult *Die deutschen Fortunatusdramen* (1892).

FORTUNATUS, VENANTIUS HONORIUS CLEMENTIANUS (c.530-c.600) Bishop of Poitiers and chief Latin poet of his time. He was born at Ceneda, near Treviso, and studied at Ravenna. After traveling through Germany and France he took up his residence at the court of Sigbert, King of Austrasia, where he wrote an epithalamium to celebrate the King's marriage with Brunhilda. He again took up the wandering life, but finally settled at Poitiers, where he was brought into association with Radegunda, wife of Clotaire II, who was living there in retirement in a convent which she had founded, and also met Gregory of Tours and other eminent ecclesiastics. He became a priest and in 599 was chosen Bishop of Poitiers. Fortunatus wrote hymns, epitaphs, poetical epistles, verses in honor of his patrons, and descriptions of events in his life. He also wrote a life of St. Martin of Tours and several other lives of saints. His hymn, *Vexilla regis prodeunt* (The royal banners forward go), is well known in the English translation by J. M. Neale. His works are in Migne, *Patrol. Lat.*, lxxxviii (Paris, 1844-80), the best edition is by Leo and Krusch (Berlin, 1881-85). For his life consult Leroux (Paris, 1885), Nisard (ib., 1880), Meyer (Berlin, 1901).

FORTUNE. A poem attributed by John Shirley to Chaucer. It first appeared in a set of poems brought together by the latter, the manuscripts of which are now in the Harleian collection in the British Museum. Its sources were partly Boethius and partly the *Roman de la Rose*.

FORTUNE, ROBERT (1813-80). A Scottish botanist and traveler, born at Kelloe, Berwickshire. He was employed in the Edinburgh Bo-

tanical Gardens and at the conclusion of the Chinese War in 1842 was sent to collect plants in northern China by the Royal Horticultural Society. A second journey to China in 1848 gave to Europe many of the beautiful flowers of the Far East and also resulted in the introduction of the tea shrub into India, where formidable competition with China in the production of tea immediately began. A third expedition included Formosa and Japan, and in 1857 Fortune again visited China to collect seeds of the tea shrub for the United States Patent Office. His published works include *Three Years' Wanderings in the Northern Provinces of China* (1847), *Report upon the Tea Plantations in the Northwest Provinces* (1851), *A Journey to the Tea Countries of China* (1852), *Two Visits to the Tea Countries of China* (1853), *A Residence among the Chinese* (1857), *Yeddo and Peking*, *A Narrative of a Journey to the Capitals of Japan and China* (1863).

FORTUNE, TEMPLE OF One of the most ancient extant temples of Rome and one of the best preserved, in the Forum Boarium, near the Æmilian Bridge. It was erected by Servius Tullius and was rebuilt in the third century B.C. In the ninth century A.D. the spaces between the columns were walled up, and the edifice became the church of Santa Maria Egiziaca. The temple is remarkable for its pure Ionic architecture. The exterior was covered with painted stucco. It contained a wooden statue, covered with two togas, which Pliny the Elder says lasted until the time of Tiberius, some thought this a statue of Servius Tullius, others a statue of Fortuna (qv). Consult Platner, *The Topography and Monuments of Ancient Rome* (2d ed., Boston, 1911).

FORTUNE, THE A playhouse which once stood near Blackfriars Bridge, London, near the site of the ancient monastery of the Black Friars. It was first erected in 1599 by Philip Henslowe and Edward Alleyn and occupied by the Lord Admiral's Company. It was originally of wood, was burned down in 1621, was rebuilt in brick, and was torn down by the Puritans in 1649. Consult H. B. Baker, *History of the London Stage, 1576-1903* (2d ed., London, 1904).

FORTUNE BAY A bay on the south coast of Newfoundland, in lat. 47° 30' N., and extending inland in an easterly direction from long. 56° west about 65 miles (Map Newfoundland, E 5). At its entrance is Brunet Island, and to the southwest are the fishing islands of St. Pierre and Miquelon, the last vestiges of French power on the North American continent.

FORTUNES OF MOLL FLANDERS, THE A novel by Defoe (1722).

FORTUNES OF NIGEL, nī'jəl, THE. An historical novel by Walter Scott (1822).

FORTUNE TELLING The telling of fortunes, whether by the arts of astrology, palmistry, or other forms of divination, was not an offense at the common law. But by the English Vagrancy Act of 1824 (5 Geo. IV, c. 83) any person who pretends to tell fortunes or practice palmistry is liable to summary punishment by imprisonment as a rogue and a vagabond. Modern statutes in this country generally class those "pretending to tell fortunes" as disorderly persons and provide for their arrest and punishment as misdemeanants.

FORTUNIO. The daughter of an octogenarian lord, who in disguise goes as her father's substitute when he is summoned for military

service With the aid of resources granted her by a fairy, she accomplishes many wonderful feats The character appears in many fairy tales, ancient and modern

FORTUNY Y CARBO (fôr-tōō'nē ē kar'bō) **MARIANO, JOSÉ MARÍA** (1838-74) A Spanish painter and etcher He was born at Réus in Catalonia, June 11, 1838, and grew up in poverty An allowance of 42 francs a month from his home town enabled him to study at the academy at Barcelona under Claudio Lorenzalez, and he also received inspiration from lithographs of Gavarni, but afterward he turned for his motives directly to nature In 1857 he won a school prize which enabled him to study at Rome During the Spanish war against Morocco (1859-60), he was on the staff of General Prim, completely absorbed in sketching those Oriental scenes which appealed most strongly to his nature The glitter, opulent color, savage movement, and dreary contemplation of the Orient are truthfully depicted in the sketches and pictures painted on his return to Rome With a view of copying the Spanish masters he went, in 1865, to Madrid, where he fell somewhat under the influence of Goya There he made the acquaintance of Madrazo, whose daughter he afterward married In 1866 he visited Paris, where he frequented the studios of Gérôme and Meissonier, and received from the art dealer Goupil commissions which placed him above want Soon he settled in Rome and henceforth devoted himself to kaleidoscopic pictures of the Rococo period, which became his special province His studio in Rome was a salon in which men of letters, artists, and many brilliant members of the social world were wont to congregate After another visit to Paris and a two years' stay in Granada, he returned to Rome in 1874, where he died of malarial fever His canvases are usually small in dimensions and, though filled with multitudinous details, are painted with great freedom, skill, and vivacity of color He was very successful in dazzling sunlight effects The city hall of Barcelona contains several of his paintings, notably the "Battle of Tetuan," a commission from the city of Barcelona, 32 metres long, but unfortunately not finished The Museo de Arte Moderno at Madrid contains "Queen-Regent Maria Christina and her Daughter Inspiring the Government Troops"

Fortuny's work was, until the advent of impressionism, the dominating influence in Spanish art, in so far as the latter was individual, and it influenced the French and Italian schools as well. Of his Oriental subjects, the best known are the "Praying Arab," "Tribunal of a Cadi," and, especially, the "Snake Charmers" (1869), in the Walters Gallery, Baltimore, the last of which he duplicated His most celebrated Rococo picture is the "Spanish Marriage," known as "La Vicaria" (1868, Marquise de Carnano, Paris), containing portraits of the painter Regnault (q.v.), Madame Fortuny, and other friends Others are "The Butterfly" and "Trial of the Model," owned by W. Clark, New York, the "Poet," the "Rehearsal," the "China Vase" (Walters Gallery, Baltimore). There is a large number of his works in America, both in public and private possession Besides those already mentioned, there are five others in the Walters Gallery, Baltimore, including "An Ecclesiastic," "Don Quixote," and the "Mendicant" The Metropolitan Museum (including the Vanderbilt collection) has "Arab Fantasia at Tangiers,"

"A Court Fool," and a portrait of a "Lady in Black," besides water colors

Fortuny was also an aquarellist of note and a brilliant etcher, his works resembling those of Goya Like him, he uses as a background the aquatint, and the outlines of his figures are drawn with light and spirited strokes Some of his chief etchings are the "Dead Arab," the "Shepherd," the "Reader," the "Pensioner," the "Anchorite," the "Arab Mourning" Consult the biographies of Fortuny by Davillier (Paris, 1875) and Yriarte, in *Les artistes célèbres* (ib., 1886) Consult also the *Fortuny Album*, published by Goupil (ib., 1889), and Muther, *History of Modern Painting*, vol. III (London, 1907)

FORT VALLEY. A city in Houston Co., Ga., 29 miles south of Macon, on the Central of Georgia and the Southern railroads (Map Georgia, C 3) It has a cotton and yarn mill, crate factory, and cotton-gin factory The water works and electric-light plant are owned by the city. Pop., 1900, 2022, 1910, 2697

FORT WADSWORTH A United States military post, established in 1827 and occupying a reservation of 221 acres on Staten Island, N. Y., commanding "the Narrows" The post office is Rosebank, N. Y., and the telegraph station is Quarantine, Clifton, S. I. It was named for Gen. J. S. Wadsworth, who was killed in the battle of the Wilderness (1864) Its garrison in 1914 was two companies of coast artillery

FORT WALLA WALLA, wō'l'la wō'l'la A former United States military post, established in 1857 and occupying a reservation of 612 acres, 1 mile from Walla Walla, Wash.

FORT WARREN. A United States military post, established in 1837 and occupying a reservation 28 acres in extent on Georges Island, 7¼ miles southeast of Boston, Mass. The post was first occupied in 1861 and during the Civil War was used as a military prison The post office and telegraph station is Boston, Mass. It is the headquarters for the coast artillery district of Boston The garrison in 1914 comprised a company of coast artillery

FORT WASHINGTON An important military post during the American Revolution, occupying the highest part of Manhattan Island and covering the ground overlooking the Hudson between the present 181st and 186th Streets, New York It was surrendered to the English under Sir William Howe on Nov. 16, 1776 After the battle of White Plains (q.v.) Washington crossed over to New Jersey, but, against his better judgment, left a considerable force under Colonel Magaw in Fort Washington Howe invested the fort on November 15 and commanded the garrison to surrender on pain of being put to the sword Magaw replied that he would defend the place to the last extremity The next day the British attacked in four divisions, led respectively by General Knyphausen and General Matthews (supported by Lord Cornwallis), Lieutenant Colonel Sterling and Lord Percy Soon after daybreak the cannonading began, and it continued with great fury on each side until noon Knyphausen's Hessians then advanced in two columns, one of which, under General Rahl, ascending circuitously to the summit of the hill, penetrated Magaw's advanced works, while the other ascended the hill in a direct line, suffering much on the way from the well-directed fire of Colonel

Rawlings' riflemen The second division made good then landing, forced the opposing Americans from their sheltering rocks and trees up a steep and rugged hill, while the third, landing under a heavy fire, succeeded, after a stubborn fight, in carrying an advanced redoubt. Percy's division, with conspicuous gallantry, carried other advanced works. On a second summons from Howe, Magaw, seeing the uselessness of further resistance, surrendered the fort, his troops (2700 in number) becoming prisoners of war. The American loss in killed and wounded was 130, the British, 454. The English had been materially assisted by the treason of one of Magaw's officers, William Demont, who on November 2 had deserted and furnished Howe with detailed plans of the American works. The loss of the fort caused great consternation throughout the United States and has been regarded as in some respects one of the greatest military misfortunes of the Americans during the war, the garrison representing the flower of Washington's army. Consult De Lancey, *The Capture of Fort Washington, the Result of Treason* (New York, 1877), Dawson, *Battles of the United States* (1b, 1858), Carrington, *Battles of the American Revolution* (1b, 1876).

FORT WASHINGTON. A United States military post, established in 1815 and comprising a reservation of 334 acres on the left bank of the Potomac River, 13 miles below Washington, D C, in Maryland. The usual garrison consists of three companies of coast artillery.

FORT WAYNE. A United States military post, established in 1842 and containing a reservation of 63 acres on the Detroit River, 4 miles from the city of Detroit, which is the post office and telegraph station. There are quarters for a battalion of infantry.

FORT WAYNE. A city, railroad centre, and the county seat of Allen Co., Ind., 150 miles by rail east by south of Chicago, Ill., at the junction of the St. Joseph's and St. Mary's rivers, which here unite in the Maumee, and on the Fort Wayne, Cincinnati, and Louisville, the Pennsylvania Company, the Ohio Electric, the Lake Shore and Michigan Southern, the Grand Rapids and Indiana, the New York, Chicago, and St. Louis, the Wabash and the Cincinnati, Hamilton, and Dayton railroads (Map: Indiana, G 2). It occupies an area of nearly 10 square miles on a plateau at an elevation of 775 feet and has a United States government building, a courthouse that cost more than \$1,000,000, St. Joseph's, Hope, and Lutheran hospitals, Indiana School for Feeble-Minded Youth, a fine high-school building, orphan asylums, a public-library building, for the erection of which Andrew Carnegie gave \$90,000, several fine public parks and boulevards, and monuments to Anthony Wayne and Henry W. Lawton. It is also the seat of Concordia College (Lutheran), opened in 1839. This city is in an agricultural district and is important as the manufacturing and distributing centre for a vast territory. The industrial plants include shops of the Pennsylvania and the Wabash railroads, foundries and machine shops, wheel works, flouring mills, electric-light works, knitting mills, oil-tank works, breweries, packing houses, and manufactories of chemicals, soap, steel dredges, mining concentrators, cigars, pianos, fertilizers, paper, dairy and food products, shirts and waists, etc.

Fort Wayne is governed under a special charter, conferred by the State Legislature, which

provides for a municipal legislative body of two councilmen from each of the 10 wards, chosen biennially, a mayor and city clerk, chosen quadriennially, and a board of water-works trustees, chosen biennially. The board of public works, board of public safety, health commissioner, park and street superintendents, city attorney, and city comptroller are appointed by the mayor. The council fixes all municipal tax levies and appropriations and has final approval of all contracts and franchises. The annual income, including revenues of water works, amounted in 1912 to \$2,051,000, expenditures to \$1,861,000, the principal items of expense being \$59,000 for the police department (including amounts for police courts, jails, etc.), \$92,000 for the fire department, and \$272,000 for schools. The water works, costing \$1,750,000, and the lighting plant and system are owned and operated by the city. Fort Wayne is built on the site of the principal village of the Miami Indians and near the site of the old French Fort Miami. In October, 1790, General Harmer burned the village. In 1794 Gen. Anthony Wayne built a fort here, which in September of 1812 was closely besieged by the Indians. A village gradually grew up and was chartered as a city in 1839, though growth of the place was very slow until after the building of the Wabash and Erie Canal, and of several railroads between 1850 and 1860. Pop., 1850, 4282, 1870, 17,718, 1900, 45,115, 1910, 63,933, 1914 (U. S. est.), 72,322, 1920, 86,549. Consult J. B. Dillon, *History of Indiana* (Indianapolis, 1859), W. A. Brice, *History of Fort Wayne* (Fort Wayne, 1868); W. H. Smith, *History of Indiana* (2 vols., Indianapolis, 1903), J. H. Levering, *Historic Indiana* (New York, 1909).

FORT WILLIAM. A city in Thunder Bay District, Province of Ontario, Canada, on the Kaministiquia River, at its entrance into Lake Superior (Map Ontario, H 8). It has a fine harbor, is favored with good water power, and carries on a large lake and rail traffic, being at the head of lake navigation on Lake Superior, a gateway to the wheat fields of western Canada, and bulk-breaking point for its incoming and outgoing freight. The terminal works of the Canadian Pacific, Grand Trunk Pacific, and Canadian Northern railroads are situated here. The city is connected by electric railway with Port Arthur, 3 miles distant. It has a number of fine public buildings, including the city hall, courthouse, two hospitals, a public library, and a collegiate institute. The manufacturing industries include flour mills, stove, machine-shop, and car-wheel foundries, shipbuilding, brick-yards, aerated water works, broom, sash, and door factories, breweries, cement-block making, and electric-power works. In 1914 there were 17 grain elevators, with a capacity of 27,401,000 bushels. The city owns 26 miles of street railway, besides its telephone, electric light, water works, and sewerage systems. It is of recent and rapid growth, and the value of its manufactured products, which in 1900 was \$111,507, was in 1910 \$534,097, an increase of 378.98 per cent. The surrounding district is rich in agricultural products and lumber. Fort William was founded as a Hudson Bay post in 1801. There is a United States consular agent. Pop., 1901, 3633, 1911, 16,499.

FORT WILLIAM. See CALCUTTA.

FORT WILLIAM HENRY. A fort erected in 1755 by Sir William Johnson. (q.v.) on the

site of the present Caldwell, N Y, at the head of Lake George. During the early part of the French and Indian War it was an important strategic position and was the starting point for many minor expeditions against the French and Indians. Rigaud, at the head of a considerable French force, made a half-hearted and unsuccessful attack upon it in the spring of 1757 (March 18-23), and later in the year Montcalm marched against it at the head of a force of about 8000, including 2000 Indians. On August 2 he demanded the surrender of the fort, then garrisoned by about 2200 men, and on the refusal of Colonel Munro, the commanding officer, began a vigorous attack. Although Colonel Webb was stationed at Fort Edward, only 15 miles away, with an English and colonial force of 1600, Colonel Munro was not reinforced, and on the 9th was compelled to surrender. Montcalm agreeing that the garrison should march out with the honors of war and should be escorted to Fort Edward by a detachment of French regulars. Early on the 10th the survivors began their march, but were soon set upon by the Indians, and a general massacre ensued, an unknown number of the troops being killed outright, and some 200 being carried into captivity. Though this attack was not instigated by the French, contemporary evidence seems to show that no earnest effort was made by them to force the Indians to observe the treaty stipulations. Cooper used this incident in his *Last of the Mohicans*. Consult W M Sloane, *The French War and the Revolution* (New York, 1901), and Parkman, *Montcalm and Wolfe* (3 vols., Boston, 1906).

FORT WILLIAM H SEWARD. A garrisoned post of regimental headquarters and a battalion of infantry, being the largest post in Alaska. It is located on Lynn Canal, 15 miles from Skagway. Haines (Presbyterian) Mission adjoins the post.

FORT WILLIAMS. A United States military post, forming a portion of the defenses of Portland harbor, Me., being 4 miles distant from that city, which is the nearest railway and telegraph station. There is a post office at the post, which is usually garrisoned by five companies of coast artillery.

FORT WINFIELD SCOTT. A United States military post, forming one of the defenses of San Francisco harbor. There are a post office and telegraph station at the post, which is 7 miles distant from the city of San Francisco. The garrison in 1914 was 10 companies of coast artillery.

FORT WORDEN. A United States military post in Washington at Port Townsend, forming one of the defenses of Puget Sound and 51 miles distant by boat from Seattle. Its usual garrison is six companies of coast artillery.

FORT WORTH. A city and the county seat of Tarrant Co., Tex., 175 miles northeast of Austin, capital of the State and 70 miles south of Red River, on the Texas and Pacific, the International and Great Northern, the Chicago, Rock Island, and Gulf, the Gulf, Colorado, and Santa Fe, the Fort Worth and Denver City, the St. Louis Southwestern (Cotton Belt), the St. Louis and San Francisco, Missouri, Kansas, and Texas, the Sunset-Central Lines, and other railways, and on Trinity River (Map Texas D 3). It is the seat of Texas Women's College (successor to the Polytechnic College, Southern Methodist), chartered in 1891, Texas Christian

University, founded in 1889 and removed to Fort Worth in 1910, which absorbed the Fort Worth Medical College in 1913, Southwestern Baptist Theological Seminary, Masomic Orphans' Home and School for Texas, Southland University (State School of the Disciples of Christ), Academy of Our Lady of Victory and Mount Carmel Academy (Roman Catholic colleges), a number of denominational schools and others for tuition in technical subjects, art, drama, music, business, etc. It contains a Carnegie library, court of Civil Appeals law library, and the Medical College medical library. There are also the Paddock Viaduct and a fine system of hard-surfaced country roads, 31 public parks or parked places, about 100 churches, nine hospitals, and an electric-power plant.

The centre of a vast stock-raising and agricultural country, Fort Worth has large jobbing interests and carries on an extensive trade in hogs, sheep and cattle, cotton oil, grain, fruit, and produce. The industrial establishments include stockyards whose daily capacity is about 27,500 head, large packing houses, whose business in 1913 exceeded \$65,000,000, grain elevators, flour, corn-meal and stock-feed mills, breweries, rolling mills, railroad repair shops, foundries and machine shops, cotton and oil mills, tin silo plants and manufactories of clothing, furniture, chemicals, candy, wagons and carriages, etc.

With an ample artesian water supply, as a provision against any possible failure of that source, the city of Fort Worth built at a cost of \$1,400,000 a large storage dam on the West Fork of the Trinity River, 7 miles from the city, with a storage capacity of 30,000,000,000 gallons. Founded as a military post by Maj. Ripley D. Arnold in 1849, Fort Worth became the county seat in 1860 and was first incorporated in 1873. The commission form of government was adopted in 1907. Receipts of the city for 1913 were \$1,937,271.29, expenditures, \$1,861,823.01, the chief items of expense being police department \$100,010, fire department \$110,000, education, \$359,620.03, interest charges, \$242,532.30. The city owns and operates its water works. Pop., 1880, 6663, 1890, 23,076, 1900, 26,688, 1910, 73,312, 1914 (U. S. Census Bureau est.), 94,494, 1920, 106,482.

FORT YELLOWSTONE. A United States military post, established in 1886 and formerly Camp Sheridan (1874). The reservation comprises 28 acres on Beaver Creek and is 5 miles from Gardiner on the Northern Pacific Railroad, within the limits of Yellowstone National Park. The post office is at the fort, and telegraph station is Mammoth Hot Springs, near the post. The garrison has charge of the Yellowstone National Park, including the protection of the visitors, and in 1914 was a squadron of cavalry.

FORTY-NINERS. A name popularly applied to the throng of fortune seekers who emigrated to California in the years immediately following the discovery of gold there in 1848, especially to those who went during the period of greatest excitement in 1849. They were also called Argonauts. They came, some by land and some by sea, from all parts of the world and had among them representatives of almost every nationality, of every color, and of every social stratum. Those who came by sea embarked for the most part from ports in the Eastern States, some making the long and dangerous voyages around Cape Horn, and others proceeding to

Chagres, and thence across the Isthmus to Panama, where they again embarked on any vessel obtainable. The chief carriers were the three side-wheelers, the *California*, the *Oregon*, and the *Panama*, of the Pacific Mail Steamship Company, which frequently transported more than three or four times the number of passengers for which they were designed. Besides these, nondescript vessels, of every size and kind, were commissioned for the service and were likewise greatly overcrowded, while many reckless adventurers, unable to force their way aboard, left for their destination in clumsy Indian dug-outs. Much as passengers by the sea suffered, however, overland travelers suffered even more. The majority of these gathered from May to June of each year at Independence or St Joseph, Mo., at that time on the frontiers of civilization, and then proceeded to Sacramento in long caravans, continually harassed on the way by the Indians, and forced to suffer terribly from starvation, exposure, and fatigue. The first emigrant train reached Sacramento in August, 1849, and others followed in quick succession. By the end of 1849 it is estimated that 42,000 emigrants had arrived by land and 30,000 by sea, of these, three-fourths were probably Americans. Consult Bancroft, *History of the Pacific States*, vol xviii (San Francisco, 1888), id., *California Inter Pocula* (ib., 1888), Bayard Taylor, *El Dorado* (New York, 1862), Stillman, *Seeking the Golden Fleece* (San Francisco, 1877), Bret Harte, *Tales of the Argonauts* (Boston, 1875), Audubon, *Western Journal, 1849-50* (Cleveland, 1906), McIlhenny, *Recollections of a 49er* (Kansas City, 1908).

FORTY THIEVES, THE. A band of robbers in the tale of "Ali Baba" in the *Thousand and One Nights*. They dwelt in a cave in the forest, the doors of which opened only in response to the words "Open, sesame." Noldeke thinks that the power of these words may be derived from the significance oil made from sesame had in Babylonian magic (Herodotus, i, 193; Jastrow, *Religion Babyloniens und Assyriens*, ii, 759 ff.) and among the Mandæans. The manuscript used by the Maronite Hanna, who told the story to Galland (see *ARABIAN NIGHTS*), has not been found. But Macdonald has recently discovered in an Oxford manuscript an Arabic text that substantially agrees with that from which Galland's translation came. Consult Macdonald, in *Journal of the Royal Asiatic Society*, 332 ff. (London, 1910), 53 (1913), Torrey, ib., 222 (1911); Noldeke, in *Zeitschrift für Assyriologie*, 242 ff. (Strassburg, 1914).

FORT YU'KON. An old and well-known trading post, located on the great bend of the Yukon River, Alaska, just within the Arctic circle (Map Alaska, K 2). It has a government school for its natives, numbering about 200.

FORUM (Lat., market place; connected with *foris*, door. Forum was the "out-of-doors" place). The term applied by the Romans to the large, open, rectangular space in the central part of any city, which was the common resort of the people for worship, for business, and for pleasure. It was originally an open space, without buildings, where the people met on market days, for religious ceremonies, elections, etc. Ultimately it was the political centre, where the magistrates and the people met and where

elections were held, here were the administrative and civic buildings or inclosures, such as the *comitum*, with its tribunals and rostra for the large assembly, the *curia*, or senate house, treasuries and basilicas, or law courts. Here, too, were the more important temples. (See *BASILICA*.) At each end of the road or roads crossing the fora were often archways, or *Janæ*, used as resorts for merchants and scribes. The other buildings bounded the forum on different sides and between them were shops, or *tabernæ*, belonging to the different trades.

Historic Evolution. In the early days of the Royal and Republican ages there appears to have been but a single forum in each Roman or Italian city, serving not only for political, legal, and mercantile purposes, but also for the popular games and amusements—the theatrical shows, wild-beast contests, gladiatorial fights, and races. (See *AMPHITHEATRE*.) The old Forum at Rome (*Forum Romanum*) and all those modeled upon it, like that of Sinuessa, were of this type. The next stage was the distinction into two fora—one devoted to religion, law, administration, and politics, and the other to the sale of commodities. This was due perhaps, to the influence of Greece, where there were often two agoras of this description—as at Athens. The Greek term "agora" meant originally a gathering of any kind, then a gathering place for purposes of every sort; later the agoras were preeminently market places. Until recently the plan and the buildings of such Greek squares were hardly known, except from descriptions by Pausanias of those at Athens, Megalopolis, Corinth, Messene, Elatea, Sparta, and Elis, but recently agoras have been excavated, especially in Asia Minor, as at Priene, Miletus, Side, Termessus, Aphrodisias, Antiphellus, Pessinus, and Cnidus. See the articles on the places named, and consult the well-illustrated article "Agora" in Smith, *A Dictionary of Greek and Roman Antiquities*, vol. i (3d ed., London, 1890). But the differences between agora and forum are considerable, notably in the great importance given to law by the Romans, which finally made of the basilicas the great factor in the administrative fora.

The Different Fora. The third stage, however, in the differentiation of the fora had been reached before the basilica (qv) had attained this importance, this step came through the establishment of a separate forum for the sale of each important commodity. There were one or more animal or meat markets (*forum boarium*, *forum suarum*, *forum pecuarium*), for hoiied cattle, pigs, and sheep respectively, a fish market (*forum piscatorium*), a wine market (*forum vinarium*), a vegetable market (*forum olitorium*), a grain market (*forum pistorium*). The various industrial and mercantile trades occupied shops around these separate squares or on streets leading from them. There were evidently sometimes covered markets, such as cloth markets, like that built by Eumachia at Pompeii. Out of this use of *forum* as a term virtually equivalent to "market" comes the employment of *forum* as part of the name of many towns, established largely as market towns. Cf., e.g., Forum Appi, Forum Julii, Forum Livi. The city theatre often adjoined the forum, as at Ostia and Timgad, so did the circus and the amphitheatre in many cases. The temples of the forum often served

more than a religious purpose, in Rome the Temple of Concord served for meetings of the Senate, and that of Saturn was at one time the State Treasury, and even the public archives (the records of the censors and financial records) were kept in it until the erection of the Tabularium (qv). In many Imperial Roman cities there was a *capitolium* in connection with the forum, a triple temple of Jupiter, Juno, and Minerva, as at Rome itself and at Suffetula. Of the fora outside of Italy, those found on the sites of the cities of North Africa are the most interesting, and their ruins are numerous and especially valuable because they have been untouched. The most important is at Thamugadi (Timgad), a military colony, as were so many other Roman cities in Africa. It had its triumphal arches at each end of its main road, its temples, curia, scholæ of the corporations, tribunal and iostia, basilica and colonnades enclosing the square.

The fora at Pompeii are also well preserved. The *forum triangulare* lay near the southern verge of the city, close to the two theatres, it had a Doric Greek temple, a colonnade on two sides, and an Ionic portico at the entrance. The principal forum was about 450 feet from north to south. The Temple of Jupiter, flanked by a memorial arch on each side, formerly the main entrance of this forum, was at its northern end, the Basilica and the Temple of Apollo were on the west side. On the east side were the *macellum*, or market, the Temple of the Genius of Augustus, the Schola, or corporation building, and the building of Eunachia, or cloth market.

The open spaces in all the fora were so filled with honorary statues, even as early as the Republican period, as well as with altars, arches, wells, memorial columns, etc., that it was necessary at times to order a wholesale removal of them (Consult Lanciani, *Ancient Rome in the Light of Recent Discoveries*, chap. iv, Boston, 1889). The fora of Rome were naturally in a class by themselves, although in the fourth century A.D. those of the new Imperial capital, Constantinople, were made by the Emperors from Constantine to Honorius almost to rival them in number and wealth of artistic decoration.

The Forum Romanum. The original Roman Forum (*Forum Romanum Magnum*) occupied the lowlands between the Palatine, the Capitoline, and the Quirinal hills, and served as political and commercial common ground for the separate tribes inhabiting these different hills, as well as for those on the Cælian and the Esquiline hills, before the closer union under the Tarquins when Rome became one city. Then the Forum took a more regular and monumental shape and was drained and surrounded by shops. The original temples of Saturn (497 B.C.), of the Dioscuri (484 B.C.), and of Concord (367 B.C.) added substantially to its beauty, but it was not until quite late (184 B.C.) that the first courthouse, the Basilica Porcia, was built, to be followed by the basilicas known as Fulvia (Æmilia), the Sempronia, and the Opimia, these structures gave to the Forum the characteristic colonnaded effect that was imitated in other cities. This crowding of the open space with buildings and honorary monuments, and the increasing importance of the political aspect of the Forum (as the place of meeting of people and Senate), as well as its legal aspect, led to the relegation to a separate market of the malodorous fishmongers' stalls (*forum piscatorium*),

and this example was followed for the other vendors, as explained above. Even this failed to give sufficient room for the rapidly expanding political-judicial life of the city, and in 54 B.C. a new era was commenced by the construction of the Basilica Æmilia in pursuance of a scheme carried forward by Julius Cæsar, who began also the addition of the special imperial fora by the construction of the Forum Julium.

Imperial Fora. The Forum Julium was followed by Augustus with his Forum Augustum or Forum Martis, by Vespasian with his Forum Pacis, by Domitian and Nerva with the Forum Transitorium, and finally by Trajan with his magnificent Forum Traiani, the most superb architectural group in Rome—all communicating with the Forum Romanum in a continuous line to the north and east of it. Of these, the Julian Forum was in the form of a sacred inclosure, around a temple of Venus Genetrix, Cæsar's patroness, the Augustan Forum, dedicated to Mars, who had aided Augustus, the latter said, in punishing the murderers of Julius Cæsar, was an inclosure ending in the Temple of Mars Ultor, flanked by two triumphal arches, and was intended to be an heroon filled with a gallery of statues of great Romans who had extended the boundaries of Roman power, the Forum of Nerva was dedicated to Minerva, and contained, besides her temple, the main thoroughfare of this part of the city, which fact gave it the name Forum Transitorium. Finally, the Forum of Trajan had its own special basilica (*Basilica Ulpia*), it was entered through a colossal triumphal arch leading to the open square of the forum surrounded by a double colonnade, with the Emperor's equestrian statue in the centre, and flanked by a large hemicycle on each side. Then came the Basilica Ulpia, also with two end hemicycles, and a double two-storied colonnade, the double Library with the Memorial Column in the intermediate area, and finally, the Temple of Trajan, erected by Hadrian. This forum established an adequate connection between the two sections of the city on either side of the Capitoline Hill. As for the Roman Forum itself, its decoration was continued to the latest days of the Empire, many honorary statues being set up and buildings repaired during the fourth century. Its appearance at that time, when it had been much enlarged over its original extent, was about as follows. Backing against the Tabularium and Capitol at the western end of the Forum (which ran approximately from west to east), were the temples of Concord, of Vespasian, and the Colonnade of the Divi Consentes. Farther east, towards the south side, the Temple of Saturn occupied the space between the ascent to the Capitol (Clivus Capitolinus) and the Vicus Jugarius. Near it the Arch of Tiberius stood. Across the Forum to the north was the Arch of Septimius Severus, with the Rostra. Beyond (east of) the Arch of Severus were the political buildings, the Curia, or Senate House, and its annexes, on the Comitium. The other buildings on the north side were the Temple of Janus, the Basilica Æmilia, the Temple of Antoninus and Faustina, the round Temple of Romulus, son of Maxentius, and the enormous Basilica of Constantine. (See CONSTANTINE, BASILICA OF.) On the opposite (south) side were the great Basilica Julia, occupying the space between the Vicus Jugarius and the Vicus Tuscus,

and the Temple of Castor (Dioscuri)—one of the most exquisite works of Roman architecture. Continuing eastward, we reach the primitive religious centre of this region, the Regia and the Shrine of Vesta with its famous atrium, opposite the Temple of Antoninus and Faustina and the Templum Urbis (See ANTONINUS AND FAUSTINA, TEMPLE OF, for the Atrium Vestæ, see VESTA) Here anciently stood the Arch of the Fabii, originally the entrance to the Via Sacra (See SACRED WAY) In the open space between the Temple of Castor and the Basilica Æmilia stood the Temple of Julius Cæsar, flanked on the south by a triumphal arch of Augustus.

Later History. The topography and monuments of the Forum appear to have suffered but slight damage from the barbarian invasions of the fifth century, and it was not until the ninth century that its ruin was noticeable, accompanied by a rise in its level. It was the fire of 1084, when Guiscard captured the city, which gave the old buildings their death blow, and buried them partly out of sight, the more conspicuous being occupied as feudal fortresses, and the level spaces turned into gardens. The Renaissance combined with its antiquarian curiosity a destructive vandalism which was more fatal to the Forum and the monuments surrounding it than any previous disasters, especially under Paul III (1534-49). The area became waste land, in which stood a few melancholy columns. It was called the Campo Vaccino, or Cow Plain. The destruction stopped only at the beginning of the nineteenth century under Pius VII and the antiquarian Fea, and excavations have been carried on almost continuously ever since then. Those conducted by Lanciani and by Boni (since 1898) have been especially fruitful. Consult the books by Lanciani and Hulsen-Carter, referred to below. The progress of researches from year to year in the Forum is noticed in the article *ARCHÆOLOGY* in the *New International Year Book* of each year.

Bibliography. Jordan, *Topographie der Stadt Rom im Alterthum* (Berlin, 1871-1906), Richter, *Topographie der Stadt Rom* (2d ed, Munich, 1901), Gilbert, *Geschichte und Topographie der Stadt Rom* (3 vols, Leipzig, 1883-90), Middleton, *The Remains of Ancient Rome* (2 vols, London, 1892), Nichols, *The Roman Forum* (1b, 1877), Lanciani, *Ruins and Excavations of Ancient Rome* (Boston, 1897), 1d, *The Destruction of Ancient Rome* (New York, 1899), handy guide of Marucchi, *Le Forum Romano* (Rome, 1901 et seq), Hulsen-Carter, *The Roman Forum* (1b, 1906), an admirable book, giving well the history of the Forum, with many illustrations and good plans, Thédénat, *Le Forum Romain et les Forums Impériaux* (4th ed, Paris, 1908), Platner, *The Topography and Monuments of Ancient Rome* (Boston, 1911, page 170, note 1, gives bibliographical information about the latest excavations), Lanciani, *Forma Urbis Romæ* (Milan, 1901), gives the ancient plan on a large scale. The inscriptions of the Forum are given in the *Corpus Inscriptionum Latinarum*, vol vi (Berlin, 1893), the best photographs are by Anderson and Alinari. An early detailed restoration, Canina, *Gli edifici di Roma Antica* (Rome, 1848-56), is spectacular but unreliable, Dutert, *Le Forum Romain* (Paris, 1876), is far preferable. The official reports of Boni are to be found in *Notizie degli scavi* (Rome, 1899 et seq).

FORUM In law, a court, or a place where legal jurisdiction is exercised. It is used by Blackstone in the first sense, when he speaks of leaving a person to his "common remedy in *foro contentiosis*"—in a court of litigation, i.e., in an ordinary court of justice. Judges sometimes refer to a domestic court as *forum domesticum*. The term is used in a similar sense when an advocate is described as eminent or successful in the forum. It is more frequently employed in the second sense, as a place of jurisdiction. It bears this signification in Kent's commentaries: "In respect to remedies," writes the Chancellor, "there are, properly speaking, three places of jurisdiction: (1) the place of domicile of the defendant, commonly called the *forum domicilii*, (2) the place where the thing in controversy is situate, commonly called the *forum rei sitæ*; (3) the place where the contract is made, or the act done, commonly called the *forum regestæ* or the *forum contractus*." When it is said that a question is to be determined by the *lex fori*, it is meant that the decision is to be in accordance with the law of the jurisdiction within which the action is brought (See *CONFLICT OF LAWS*). The employment of the term in these and similar significations is due to the fact that Roman courts of justice were held in or near the Forum. Consult Forsyth, *Horænius the Advocate*, chap. iii (Jersey City, 1881).

FORUM ALIENI. See FERRARA.

FORUM APPII. A town on the famous Appian Way (qv), the modern Foro Appio, 43 Roman miles from Rome. Here a canal began which ran southward parallel with the Appian Way to within a short distance of Terracina. Horace (*Satires*, 1, 2 et seq.) has an amusing description of the place as "abounding in boatmen and wretched inns." Here travelers might, if they preferred, change from the road to the canal boat. This was Horace's choice, much to his discomfort. At this place Paul, on his journey to Rome, being met by brethren of the Roman church, "thanked God and took courage" (Acts xxviii 15).

FORUM AUGUSTUM. See FORUM, AUGUSTUS FORUM OF.

FORUM BOARIUM. The ancient cattle market of Rome, situated between the Velabrum and the Tiber, it was one of the busiest quarters of ancient Rome. In it, near the Tiber, stands an elegant circular temple, popularly, but erroneously, called the Temple of Vesta. See FORTUNE, TEMPLE OF, FORUM. Consult Platner, *The Topography and Monuments of Ancient Rome* (2d ed, Boston, 1911).

FORUM CORNELII. See IMOLA.

FORUM HOLTORIUM, or OLITORIUM (Lat, vegetable market). The vegetable market of Rome, adjoining the Forum Boarium, north of the piece of the Servian Wall which ran from the Capitoline Hill to the Tiber. The space contained several temples, of which some remains are preserved. Consult Platner, *The Topography and Monuments of Ancient Rome* (2d ed, Boston, 1911).

FORUM JULII. See FRÆJUS, FRIGILI.

FORUM JULIUM, or FORUM OF CÆSAR. The first of the five Imperial fora at Rome. It was built by Cæsar from the spoils of the Gallic war, on ground to the northeast of the Forum Romanum, for which \$4,000,000, it is said, was paid. It was surrounded by arcades and a wall and contained the magnificent Temple of Venus Genetrix. Nothing now remains of

its buildings but some half-buried arches and a part of the inclosure wall Consult Platner, *The Topography and Monuments of Ancient Rome* (2d ed, Boston, 1911) See FORUM

FORUM OF VESPASIAN See FORUM PACIS

FORUM PA'CIS (Lat, Forum of Peace), or **FORUM OF VESPA'SIAN** The third of the Imperial fora at Rome, built in 71-75 A.D. to inclose Vespasian's Temple of Peace, called by Pliny the Elder one of the three most magnificent buildings in Rome In it were dedicated the spoils taken from Jerusalem. There are no remains of the temple. This forum was separated from the Forum of Augustus by a wide street leading from the Subura to the Forum Romanum This strip later became the Forum Transitorium of Nerva Consult Platner, *The Topography and Monuments of Ancient Rome* (2d ed, Boston, 1911) See FORUM, NERVA, FORUM OF

FORUM ROMA'NUM See FORUM

FORUM TRANSITORIUM See NERVA, FORUM OF

FORWARD, WALTER (1786-1852) An American lawyer and cabinet officer, born in Hartford Co, Conn In 1803 he removed to Pittsburgh, Pa, where for some time he edited a Democratic newspaper, the *Tree of Liberty* He studied law, and was admitted to the bar in 1806 In 1822 he was elected to Congress as a Democrat, to fill a vacancy, and in 1823 began a full term He supported John Quincy Adams for the presidency, and became a Whig He was a leading member of the Protectionist Convention at Harrisburg in 1827, was active in the Pennsylvania Constitutional Convention in 1837, and in 1841 was appointed by President Harrison First Comptroller of the Treasury After the death of Harrison and the subsequent resignation of his cabinet, Forward was appointed Secretary of the Treasury by President Tyler, in September, 1841, but as Tyler broke away more and more from the Whigs, his position became more difficult, and finally, in March, 1843, he resigned From 1843 to 1849 he practiced law in Pittsburgh, from 1849 to 1851 was chargé d'affaires at Copenhagen, Denmark, and from 1851 to his death was president judge of the Allegheny County District Court

FORWARDING The business of receiving and transmitting goods for another The forwarding merchant assumes the expense of transportation and receives compensation from the owner Such a person is not deemed a common carrier, but is merely a warehouseman or agent and is required only to use ordinary diligence in sending the property by responsible persons and to obey the instructions of his principal Forwarding merchants have in the United States been superseded largely by express companies Common carriers often act as forwarders of goods from points on their own line to other

places A person who holds himself out as a public forwarder is under a legal duty to receive and forward all goods tendered to him by any person for a reasonable compensation, unless he can show a valid excuse for his refusal or failure so to do See CARRIER, COMMON

FOSCARI, fos'ka-re, FRANCESCO (1373-1457) Doge of Venice from 1423 to 1457 Previous to his election he had been a Chief of the Forty, a Chief of the Ten, Inquisitor of the Ten, and Avogadar of the Commune He was always an advocate of an aggressive policy on the Italian mainland, for the purposes of territorial aggrandizement, and he was elected to the Dogate as an exponent of such a policy He soon entered upon a course of conquest, which continued, with intervals of peace, for nearly 30 years, and which in spite of many defeats resulted in the reduction of a large part of northern Italy under Venetian rule In 1426-27, in league with Florence, Naples, Savoy, and many minor principalities, he carried on a conflict with the Visconti of Milan As a result, Venice acquired the towns of Bergamo, Cremona, and Brescia War broke out again in 1431, the Venetian forces suffered defeat, but in the treaty of peace the territories of the Republic were nevertheless extended to the Adda Two years later hostilities were recommenced, this time Venice, Florence, Genoa, and the Pope were arrayed against Milan, Mantua, and Naples, and by the Peace signed in 1441 Venice gained possession of Peschiera and other places Hostilities were finally terminated by the Peace of Lodi in 1454 In spite of his uniform success in Italy Foscari was forced to meet bitter opposition at home This was based mainly on the fact that, owing to the Italian wars, the influence of Venice had suffered greatly at the hands of the Turks in Greece and in the Grecian Archipelago His life was also embittered by the misdeeds of his youngest son, Giacopo, who, with the father, forms the subject of Byron's tragedy *The Two Foscari* In 1445 Giacopo was denounced for having received bribes in order to use his influence in the disposal of state offices He was tried by the Council of Ten and banished, but in 1447, on the Doge's petition, he was allowed to return, and he lived quietly at Venice for three years In 1450 one of the Council of Ten was murdered, and suspicion fell upon Giacopo, who in the following year was tried, tortured, and banished to Candia, the Doge taking no part in the trial There was great doubt about Giacopo's guilt, but he seems to have engaged in treasonable correspondence, for which he was again tried in 1456 and again banished There was still so much uncertainty about his guilt that there was a movement to recall him when his death was announced, in 1457 Foscari, worn out and broken-hearted, was soon after deposed illegally by the Council of Ten, through the machinations of his enemy, the Admiral Giacopo Loredano, who had been one of the chief instigators of the action against the younger Foscari He resisted at first, but yielded to force, and left the Doge's palace on Oct 24, 1457 He died on November 1 Consult Romanin, *Storia Documentata di Venezia*, vol iv (Venice, 1855), Hazlitt, *The Venetian Republic* (2 vols, London, 1900), Brown, *Venice* (New York, 1893)

FOSCOLO, fos'kò-lo, Ugo (1778-1827) An Italian writer, born at Zante, in the Ionian Isles, the son of a Venetian family then settled

there Originally called Niccolò, he early changed his name to Ugo Part of his childhood was spent in Dalmatia with his father, a physician, when he died, Ugo returned to Zante, whence, probably in 1793, he went to Venice He continued his education in this city, feeding on the writings of the French philosophers, inflaming his patriotism with Alfieri's tragedies, and making occasional visits to the University of Padua, where he came under the influence of M Cesarotti At this time began the multitudinous love affairs which marked the course of his life Among his verses of this period is the poem *La Giustizia e la pietà*, in imitation of Young's gloomy sentimentality Soon after appeared the odes, *A Luigia Pallavicini* and *All' amica risanata*, of remarkable beauty of form and sincere classic feeling While these show the influence of his friend Parini the sonnets (1800-02), some of the most perfect in the language, suggest Alfieri Taking an active part in the political discussions which followed the fall of the Venetian Republic, he addressed an ode to Napoleon, expecting him to establish a free government in its stead Embittered by Napoleon's transfer of Venice to Austria, he wrote the *Letters of Jacopo Ortis* (1798), a sort of political Werther who succumbs to the sufferings of his disillusioned patriotism Relieved by this expression of his feeling, with renewed hope in Napoleon he served with the Italian division of the French army from 1804 to 1806 and spent some time at Boulogne-sur-Mer, which was later useful to him when he translated Sterne's *Sentimental Journey* In 1807 appeared *I Sepolcri*, in many respects his masterpiece, a magnificent attempt to find "refuge in the past from the misery of the present" In splendid lyrical passages it extols burial monuments as incentives to virtue and good deeds in their recall to the living of the mighty dead He was appointed to the chair of eloquence at the University of Pavia in 1808 His inaugural discourse, "Dell' origine e dell' ufficio della letteratura," in which he passionately appealed to his young countrymen to study literature in its relation to national life and growth, produced a sensation, resulting in Napoleon's suppression of this chair in all Italian universities His classical tragedy, the *Ajace*, performed at Milan in 1811, contained allusions to Napoleon, and the author was obliged to leave Milan He went to Florence, where he wrote another tragedy, *Ricciarda*, and began the *Hymn to the Grave*, dedicated to Canova, in which he wished to embody all metaphysical conceptions of the beautiful He never completed it In 1813, when Napoleon's power declined, he returned to Milan, only to leave the city again when the Austrians regained control of it and his patriotic sentiments prevented him from taking the oath of allegiance to the foreigner Self-exiled, he went to Switzerland and then to England, where he was enthusiastically received as a type of fearless patriot He lived at Kensington, in London, burdening himself to such an extent with debts by his lavishness that he was for a while imprisoned He was rescued from poverty and misery by his friend, Hudson Gurney, and died at Turnham Green His remains were interred at Chiswick In 1871 the Italian government had them transferred to Florence, where with many honors they were buried in the church of Santa Croce

Foscolo is also a conspicuous figure in criticism He was the first among the Italians to

consider a work of art as a psychological phenomenon, with its causes in the mind of its author and in the characteristics of the century in which it was produced For an edition of Boccaccio's works (London, 1825) he wrote as a preface his *Discorso storico sul testo del Decamerone*, and for an edition of Dante's great poem he prepared an essay, *Sul testo della Commedia di Dante* (Brussels and London, 1842), which is a treatise of importance in the history of Dante studies He also contributed articles to English magazines Many of his letters are printed in the *Epistolaria*, in the edition of his works published at Florence (1850-62), others have been edited by Tobler (Leipzig, 1871) He is revered by his country as a great poet, but he was, besides, in spite of many faults and fluctuating fortunes, a true patriot

FOS/DICK, CHARLES AUSTIN (pen name, "HARRY CASTLEMAN") (1842-1915) An American writer of juveniles He was born at Randolph, N Y, was educated at the Central High School of Buffalo, N Y, and served in the Civil War He is author of more than 50 books of adventure for boys, including *Frank on the Lower Mississippi* (1869), *The Buried Treasure* (1877), *The Boy Trapper* (1878), *George at the Fort* (1882), *Don Gordon's Shooting-Box* (1883), *Oscar in Africa* (1894), *Elam Storm, the Wolfers* (1895), *Carl the Trapper* (1900), *Floating Treasure* (1901), *Frank Nelson in the Forecastle* (1904), *Snowed Up* (1904)

FOSDICK, JAMES WILLIAM (1858-) An American mural painter, craftsman, and writer on art He was born at Charlestown, Mass, and studied art first at the school of the Boston Museum, later he was able to go to Paris, where at the Académie Julian he had as teachers Boulanger, Lefebvre, and Collin Mural painting and pyrography (qv) came to be his special interests After his return to America the latter received much of his attention—he was among the first to give thorough study to this still only partly developed art He decorated important private residences (Gould, Havemeyer, Lewisohn, etc.) in New York (where he established himself), and elsewhere Among his works one of the most important is "The Adoration of St Joan of Arc," in the National Gallery, Washington, others are a "Decorative Portrait of Louis XIV" in the Pennsylvania Academy of Fine Arts, and "Arethusa" (1912) In 1890 he was made a member of the New York Architectural League, and later of the Society of Mural Painters (of which he became secretary), and the Copley Society

FOSS, CYRUS DAVID (1834-1910). An American Methodist Episcopal bishop He was born

at Kingston, N Y, graduated at Wesleyan University in 1854, and entered the itinerant ministry of the Methodist Episcopal church, in the New York Conference, in 1857. From 1857 to 1859 he was a pastor at Chester, Orange Co, N Y, from 1859 to 1865 in Brooklyn, and from 1865 to 1875 in New York City. He was president of Wesleyan University from 1875 to 1880, when he was elected a bishop. In 1878 he was delegate to the General Conference of the Methodist Episcopal Church South, in Atlanta, Ga, and in 1886 to the British Wesleyan Conference, in London. He made tours of the missions of his church in Europe (1886), Mexico (1893), and India and Malaysia (1897-98), and wrote *From the Himalayas to the Equator* (1899), *Religious Certainties* (1905), and *Temperance and the Pulpit* (1910). Consult *Cyrus David Foss A Memorial* (Philadelphia, 1910).

FOSS, EUGENE NOBLE (1858-) An American manufacturer and public official. He was born at West Berkshire, Vt, and was educated at the university of that State. Engaging in manufacturing in Boston in 1882, he became treasurer and general manager of B F Sturtevant & Co, president of the Becker Milling Machine Company, the Mead-Morrison Manufacturing Company, the Burgess Mills, and the Maverick Mills, and a director in many other corporations. In 1902 he began the advocacy of tariff reform and reciprocity, in 1910 he was elected to Congress on the Democratic ticket, and from 1910 to 1913 he was Governor of Massachusetts. During his last year of office he aroused the hostility of the labor unions, and this was instrumental in defeating his candidacy for a fourth term.

FOSS, SAM WALTER (1858-1911) An American journalist and writer of humorous verse. He was born at Candia, N H, and graduated from Brown University in 1882. He was editor of the *Saturday Union* in 1883-87 and the *Yankee Blade* in 1887-95 at Lynn, Mass, and from 1888 to 1895 he was also editorial writer for the *Boston Globe*. In 1898 he became librarian of the Somerville Public Library. He frequently gave lectures and readings of his own poems, the volumes of his verse including *Back Country Poems* (1894), *Whiffs from Wild Meadows* (1896), *Dreams in Homespun* (1898), *Songs of War and Peace* (1899), *Songs of the Average Man* (1907).

FOS/SA, or FOUS/SA (Malagasy) The largest carnivorous mammal of Madagascar, a slender, lithe creature, connecting the cats and civets and in structure partaking of both. It is about twice the size of a house cat and has a very long, tapering tail, so that it measures fully 5 feet from tip of nose to end of tail. It is nearly uniformly pale brown in color, with the hair short and close and no spots. Each foot has five catlike toes, the claws of which are sharp, curved, and retractile, but the soles of the hind feet are entirely naked and rest upon the ground in walking. The dentition is a mixture of forms characterizing both the cats and the civets, the teeth numbering 36 in all. A separate family has been proposed for this strange carnivore by several zoologists, but it seems best to regard it as alone representing a group *Cryptoproctinae* within the civet family (*Viverridae*), under the name *Cryptoprocta ferox*. It seems to be confined to Madagascar, where it is not numerous, and although much dreaded by the natives, on account of its repu-

tation for ferocity and ability to do harm, is rarely seen, since it is wholly nocturnal. It feeds upon small animals and buds and occasionally invades poultry yards, but its general habits are little known.

FOSSA DRUSIANA See DRUSUS, 3, GERMANIA.

FOS/SA MA/RIA/NA (Lat, trench of Marius) The canal made 102 B.C., by Marius, from the Rhone to the Gulf of Stomalmne, near the modern village of Foz (*Fossæ Marinæ*). It was constructed to avoid the difficult navigation at the mouths of the river, caused by the accumulations of sand by the several streams. It was about 16 miles long and was later given to the inhabitants of Massilia (Marseilles), who derived large revenues from it.

FOSSANO, fös-sa'nō A city in the Province of Cuneo, north Italy, 1235 feet above sea level, on the left bank of the Stura, 40 miles south of Turin, 15 miles northeast of Cuneo (Map-Italy, A 2). The name "Fossano" is derived from the Latin *Fons Sana* (Healthful Spring). The city has promenades on the site of the old walls, a fourteenth-century castle, a cathedral, a seminary, a gymnasium, a veterinary school, two houses of correction, and an academy of science. It manufactures silk fabrics, gunpowder, leather, paper, and baskets. Fossano was purchased by the house of Savoy in 1340, was the residence in the sixteenth century of Philibert Emmanuel and several of his successors, and in 1796 and 1799 was the scene of battles between the French and the Austrians. Pop. (commune), 1901, 18,133, 1911, 18,731.

FOSSANO, AMBROGIO See BORGOGNONE.

FOSSE See FOSSWAY.

FOSSE, CHARLES DE LA. See LA FOSSE, CHARLES DE.

FOS/SIL (Fr *fossile*, from Lat *fossilis*, dug up, fossil, from *fodere*, to dig, connected with Corn *bedh*, Welsh *bedd*, grave, OChurch Slav *bosti*, Lith *badyti*, to pierce). Any remains or trace of the form of animals or plants found buried by natural causes in deposits or rocks before the present era. The term was formerly applied to anything dug up out of the ground and included minerals, prehistoric implements, etc. At the present day the word is used as an adjective in this latter sense, and also to designate anything pertaining to prehistoric times. Thus, we read of fossil salt, fossil raindrops and mud cracks, and fossil lakes, deserts, seabeaches, and shores. The word "petrification" is often incorrectly employed as a synonym for "fossil," although it properly designates only such organic remains as have been turned to stone, as described below. Fossils are the relics of the animals and plants that have lived upon the earth and in the waters of the earth during the long periods of its geological history, and study of their organization, occurrence, and relations to each other and to modern organisms constitutes the science of paleontology (qv). Fossils are naturally absent from all rocks of igneous and volcanic origin and, on the other hand, they are present originally in nearly all rocks of sedimentary origin. From large masses of these latter they have been obliterated by chemical and physical changes, so that they are now seldom or sparingly found in metamorphic rocks. The processes by which organic remains have been preserved are grouped under the term "fossilization." This includes entombment and the subsequent changes that have ensued. The

place of entombment may be on land, in fresh water, or in the salt water of bays, seas, or oceans

The degree of preservation of fossils varies greatly. In some few cases the flesh of animals has been preserved as if in an ice box. Mammoth carcasses embedded in the frozen mud cliffs of Siberia for thousands of years had meat so fresh that it was eaten by the dogs of the exploring party. The most perfectly preserved fossils are undoubtedly those insects found in the Tertiary amber of the Baltic provinces, where the form, structure, and colors are retained intact. Then we find shells preserved in the rocks with their original organic matter replaced by some mineral, usually silica, or perhaps barite, pyrites, or even zinc blende. Such replacements rightly receive the name of "petrifications." In other cases we find cavities in rocks, the sides of these retaining impressions of the outer and inner surfaces of shells which have been dissolved and destroyed by percolating waters. These "molds" are sometimes filled with calcite, or quartz, or other mineral matter, and then we have "casts" of the original organic forms. The study of these molds is puzzling to the beginner, because of the multiplication of forms so caused. A single shell like a limpet, if preserved in the rocks, may present four different aspects as a fossil—the outer and inner surfaces of the shell itself, and the molds of each of these. The mold of the outer surface may pull away such delicate spines as may ornament the shell, and for this reason molds should always be carefully collected and treated with acid, after which the impression of the original shell surface is often shown with the utmost fidelity to detail. Another class of fossils consists of the impressions or trails made by animals crawling over the bottom of the water or over the beach, and also of burrows or casts of burrows that served as dwelling places or passageways for worms, crustaceans, etc. The study of the footprints of reptiles and supposed birds, which are so abundant on the surfaces of the Jurassic sandstones of Massachusetts and Connecticut, was named "ichnology" by E. Hitchcock, who described and figured a host of such impressions. (See ICHNOLOGY.) Similar footprints are found in rocks of shallow-water origin of Mesozoic and Tertiary age all over the world.

The parts of animals likely to be preserved are always those that resist longest the destructive agencies that may attack them both before and after their entombment. The soft parts are seldom preserved, and often also the hard parts are destroyed. Because of this certain groups of animals are represented by insignificant parts of their anatomy, which, though of great importance to the paleontologist, are usually laid aside by the zoologist as of trivial interest. Thus, the presence of sponges in certain formations is demonstrated by their isolated spicules, holothurians are recognized by their minute calcareous plates and anchors, worms by their teeth and dwelling tubes, dibranchiate cephalopods by their internal shells, and many fish by their teeth, ear bones (otoliths), spines, and dermal scales.

The manner of entombment of fossils varies greatly. In many cases the shells of mollusks have been dead a long time and have become incrustated with polyzoans and corals before they were entombed. In other cases they were washed along the shore and broken and worn

by the waves so that now in fragmentary condition they form "shell limestones." Among the crustacean fossils we find those that were killed suddenly, perhaps by some change in the temperature of the water, in which case their remains are usually well preserved. In some rocks of fresh-water or estuarine origin certain layers are covered with the remains of fish. These evidently lived in shallow pools that were either dried up suddenly or became so heated by the sun that the fish were killed, soon to be covered by sediment. Such conditions are frequent in the Catskill, Old Red Sandstone, and Jurassic formations. Myriads of insects of Tertiary time became entangled in the soft gum of coniferous trees and are now preserved in the amber of the Baltic and the fossil resins of Africa and New Zealand.

The old ideas regarding fossils were curious and often fantastic. A few of the Greek and Roman philosophers had well-denned ideas of their true nature as entombed animals and plants that had once lived in the sea and upon the earth, but the majority of early writers attached to them some fanciful or supernatural origin. Thus they were explained as due to the *vis plastica*, or creative force that formed living things out of inorganic materials, as spoils of nature, as due to some peculiar fermentative process in the earth, or as originating in some unknown influence of the stars. Another hypothesis, maintained for centuries and even now persisting in uneducated communities, explains fossils as the remains of animals and plants washed up on the land and there stranded by the waters of the Noachian deluge. These erroneous ideas persisted in the face of true explanations by some observers until the beginning of 1800, when slowly the true nature of fossils and their relations to the rocks in which they are entombed began to be more universally understood, and at last during 1800 to 1840 there were laid the foundations of the science of paleontology.

For further information on the early ideas regarding fossils, consult Lyell, *Principles of Geology*, vol. 1 (New York, 1872), and Von Zittel, *History of Geology and Palæontology*, translated by Oglvie-Gordon (ib., 1901). For modes of fossilization and the relations between fossils and the rocks containing them, consult Geikie, *Text-Book of Geology* (London, 1903). White, "The Relations of Biology to Geological Investigation," in *Smithsonian Institution Report of the United States National Museum for 1892* (Washington, 1894), Marr, *Principles of Stratigraphical Geology* (Cambridge, 1898), Schuchert, "Directions for Collecting and Preparing Fossils" in *Smithsonian Institution United States National Museum, Bulletin No. 39* (Washington, 1895), Hartzell, "Conditions of Fossilization," in *Journal of Geology*, vol. xiv (Chicago, 1906), Schuchert, "Fossils for Stratigraphic Purposes," in *Economic Geology*, vol. viii (Lancaster, Pa., 1913). FOSSIL BOTANY. See PALEOBOTANY.

FOSSIL FOOTPRINTS. See ICHNOLOGY.

FOSSIL FORESTS. The popular term applied to groups of petrified tree trunks. Such forests may be found at the locality and in the position in which they grew, or, what is more frequently the case, they may have been carried some distance from their native soil before being

buried and silicified Fossil trees are not uncommon in the coal measures of the United States, but the most celebrated examples, belonging to more recent geological periods, are those of Arizona and the Yellowstone Park. Along the Little Colorado River, in Arizona, there are great numbers of well-preserved trees, scattered over the surface, some of which attain a diameter of 5 feet and a length of more than 50 feet. The wood cells have been replaced by silica, which is either colorless, like quartz, or shows the beautiful tints of agate, opal, and Jasper, the structure of the wood is preserved to a most remarkable degree. Heavy beds of Triassic marls cover the surface, and it is in this formation that the trees are found. The silicification was probably accomplished by hot alkaline waters, carrying dissolved silica, there is evidence of volcanic activity in the region which might well give rise to thermal springs. Many of the trees have been removed for cutting and polishing into various artistic objects, rivaling onyx and the rarer marbles in delicacy of color, and this wholesale destruction has given much concern lest the forest be entirely destroyed. A similar fossil forest in the Yellowstone valley has many erect stumps of large size. Along the shore of Chesapeake Bay, south of Baltimore, is a forest in which the giant trunks of cypress rise from a bed of peat that is covered by Pleistocene clays. The Bad Lands of the Little Missouri abound in petrified trees which have been washed out from shales and sandstones of the Laramie group. Another forest, remarkable for the great size of its trees, is found in Napa Co., Cal. In England fossil trees were laid bare at Parkfield Colliery, near Wolverhampton, in 1844. Within the space of one-fourth of an acre there were 73 stumps with attached roots, the trunks lying prostrate in every direction. The wood was converted into coal. Silesia, Egypt, and the island of Antigua, in the West Indies, also have fossil forests. Consult Marsh, *American Journal of Science* (New Haven, 1871), Hague and others, "Geology of the Yellowstone National Park," *United States Geological Survey, Monograph 32* (Washington, 1899), Merrill, *Fossil Forests of Arizona* (Adamana, Ariz., 1911).

FOSSILIFEROUS ROCKS (from Lat *fossilis*, dug up, fossil + *ferre*, to bear). Rocks which contain organic remains. If we except the lowest metamorphic rocks of the Algonkian system, in which, as yet, no undoubted fossils have been found, the term is equivalent to "stratified rocks" and "sedimentary rocks" when used comprehensively, but it may also be applied to a particular bed, barren of organic remains, as in case of an unfossiliferous sandstone compared with a neighboring fossiliferous shale or limestone.

FOSSOMBRONE, fōs'sōm-brō'nā. A city in the Province of Pesaro e Urbino, central Italy, 44 miles northwest of Ancona by way of Fano (Map Italy, D 3). It is situated in the valley of the Metauro, on the ancient Via Flaminia, and 11 miles southeast of Urbino. A noteworthy feature is its cathedral containing a fifteenth-century altar by Domenico Rosselli, the church

of San Francisco has a lunette by the same artist. The city has a gymnasium, technical schools, and important silk and oil industries. In the vicinity (2 miles to the northeast at S Martino al Piano) are ruins of the Roman colony Forum Sempronii, which was destroyed by the Goths and the Lombards. The hill of Pietralata, sometimes called Monte d'Asdrubale, where, according to tradition, the battle of the Metaurus took place in 207 B.C. (see HASDRUBAL, 3), and the Furlo Pass, a tunnel, 120 feet long, 17 feet wide, and 14 feet high, hewn through the solid rock, as the inscription at the northern entrance shows, by the Emperor Vespasian in 77 A.D. Pop. (commune), 1901, 10,428, 1911, 9701.

FOSSOMBRONI, fōs'sōm-brō'nē, VITTORIO, COUNT (1754-1844). An Italian statesman and scientist, born at Arezzo. He studied at the University of Pisa, and after holding other offices in the Grand Duchy of Tuscany, became Minister of Foreign Affairs (1796). When Tuscany was converted into the Kingdom of Etruria (1801), he acted as Commissioner of Finance and proposed a scheme of monetary reform. In 1805 he became lieutenant general of the Tuscan troops. He was a senator of the Empire and president of a commission on sanitation in Rome and on draining the Pontine Marshes. When the grand duchy was reestablished, in 1814, Fossombroni was made Prime Minister and President of the Legislature. His main work was putting the Tuscan finances on a sound footing. His published works are *Sur l'intensité de la lumière* (1782), the very important *Mémoire hydrolico-historique sopra le val di Chiana* (1789), *Sur l'équation conditionnelle* (1794), *Sur le principe de la vélocité virtuelle* (1796), *Sur l'amélioration des marais Pontins* (1805).

FOSSWAY, or **FOSSE**, THE. A road in England, built by the Romans. It ran probably from the seacoast at Seaton in Devonshire to Lincoln, with a continuation northward to the Humber, known as "High Street." The earliest mention of the Foss is in some Anglo-Saxon charters dating from the eighth century, and travelers along it enjoyed from early times the special protection known as the King's Peace. This sanctity it enjoyed together with the other three so-called Roman ways. Watling Street, Icknield Street, and Ermine Street. The Foss was constructed early during the Roman occupation to facilitate the military control of the island. It was still in good condition in the twelfth century, but has now almost disappeared. Consult Guest, "The Four Roman Ways," in *Origines Celticae* (London, 1883), and Codrington, *Roman Roads in Britain* (ib., 1903).

FOSTER, ABBY KELLEY (1811-87). An American reformer, born of Quaker parentage, at Pelham, Mass. After attending the Friends' School at Providence, R. I., she taught for several years in Massachusetts. In 1837 she delivered a series of lectures in favor of the abolition of slavery. She was the first woman who had ever appeared before mixed audiences as an advocate of antislavery principles, and although she was the object of harsh criticism and was compelled to suffer indignities and rough treatment, her attempt met with considerable success. In 1845 she married Stephen Symonds Foster (qv), the Abolitionist, with whom she lectured. Afterward she advocated prohibition and woman's suffrage.

FOSTER, SIR AUGUSTUS JOHN (1780-1848) An English diplomat Through his mother's influence (she had married the Duke of Devonshire after the death of John Thomas Foster) he was made Secretary of the English Legation at Naples, and in 1811 was sent to the United States as Minister with definite instructions to settle the affair of the *Chesapeake*. At the outbreak of the war he returned to England and was elected member of Parliament. He was made Minister at Copenhagen in 1814, passed 10 uneventful years there, and in 1824 went to Turin, where he stayed until 1840 and then retired. He committed suicide on Aug. 1, 1848.

FOSTER, BEN (JAMIN) (1852-1926). An American landscape painter, born at North Anson, Me. He was a pupil of Abbott Thayer in New York City, and of Oliver Merson and Aimé Morot in Paris. His art is founded on French methods and he is particularly successful with the misty effects of early morning and evening, and moonlight nights. His "Mists of the Morning" (1901) obtained the Webb prize, and he received other medals, including the Inness gold medal of the National Academy of Design in 1908. He was elected to the National Academy in 1904. His "Lulled by the Murmur of a Brook" is in the Luxembourg Gallery. Other important canvases are "Sunset in the Litchfield Hills," Corcoran Art Gallery, Washington, "Birch Clad Hills," National Gallery, Washington, "Misty Moonlight Night," Brooklyn Institute Museum, "In the Connecticut Hills" (1914), Metropolitan Museum, New York. He is also represented in the Pennsylvania Academy, Philadelphia, and the Toledo Museum.

FOSTER, CHARLES (1828-1904). An American Republican politician and Secretary of the Treasury. He was born near Tiffin, Ohio. He was educated at Norwalk Academy and entered his father's store (in Fostoria, a town named in honor of his father), becoming a partner and finally succeeding to the control of the business, which under his efficient management became one of the largest retail and wholesale mercantile establishments in the State. In connection with this business he established a bank and dealt largely in grain and produce. During the Civil War he actively aided in the recruiting and equipment of the Ohio troops. Elected to Congress on the Republican ticket in 1870, he was reelected in 1872, 1874, and 1876. In the winter of 1874-75 he visited New Orleans as chairman of the subcommittee of Congress to examine into frauds in Louisiana. In 1879 he was elected Governor of Ohio by 17,000 majority, and two years later, in 1881, was reelected, serving until Jan. 1, 1884. His administration was marked by reforms in the management of State institutions and by an attempt to reform the taxation of the liquor traffic. In 1889 Foster was appointed by President Harrison chairman of a commission to draw up a treaty with the Sioux Indians. In February, 1891, he succeeded William Windom as Secretary of the Treasury in Harrison's cabinet and this portfolio he held until March, 1893.

FOSTER, SIR CLEMENT LE NEVE (1841-1904). A British mineralogist, born at Camberwell. He studied at Boulogne and Amiens, attended the Royal School of Mines, London, and the mining academy at Freiberg, Saxony, and graduated from the University of London in 1865. Appointed to the Geological Survey in

England in 1860, he spent five years in field work. After exploring Egypt and Venezuela, and serving as a mining engineer in Italy, he was inspector of mines for Cornwall from 1872 to 1880 and for north Wales from then until 1901. In the Royal School of Mines he was professor of mining from 1890 until his death. He was elected a fellow of the Royal Society in 1892 and was knighted in 1903. Besides memoirs and papers, he is author of *A Treatise on Ore and Stone Mining* (1894, 7th ed., 1910) and *The Elements of Mining and Quarrying* (1903, 2d ed., 1910).

FOSTER, FRANK HUGH (1851-). An American clergyman of the Congregational church. He was born in Springfield, Mass., graduated at Harvard in 1873, from 1873 to 1874 was assistant professor of mathematics in the United States Naval Academy, and in 1877 graduated at Andover Theological Seminary and was ordained to the Congregational ministry. In 1877-79 he was pastor at North Reading, Mass., in 1879-82 studied at Gottingen and Leipzig, and from 1882 to 1884 was professor of philosophy in Middlebury College. In 1884 he was appointed professor of Church history in the Oberlin Theological Seminary, and from 1892 to 1902 he was professor of systematic theology in the Pacific Seminary, Berkeley, Cal. In 1904 he went to Olivet, Mich., as pastor of the college and the village church. He was an editor of the *Bibliotheca Sacra*, translated Grotius' *Defense* (1889), wrote *Christian Life and Theology* (1900), *A Genetic History of the New England Theology* (1907), and the chapter on Zwingli's theology in Jackson's biography of Zwingli (1901).

FOSTER, GEORGE BURMAN (1858-). An American Baptist theologian, born at Alderson, W. Va. He graduated in 1883 at West Virginia University and at the Rochester (N. Y.) Theological Seminary in 1887, and was pastor of the First Baptist Church of Saratoga Springs, N. Y., from 1887 to 1891. In 1891-92 he studied in Germany, from 1892 to 1895 he was professor of philosophy in McMaster University, and in 1895 he became professor of systematic theology in the University of Chicago and in 1905 professor of the philosophy of religion. He wrote *The Finality of the Christian Religion* (1906) and *The Function of Religion in Man's Struggle for Existence* (1909).

FOSTER, SIR GEORGE EULAS (1847-1919). A Canadian statesman. He was born in Carleton Co., New Brunswick, and graduated at the University of New Brunswick in 1868, afterward studying in the universities of Edinburgh and Heidelberg. After several years of school-teaching he was appointed professor of classics and history in the University of New Brunswick. He resigned his professorship in 1879, and after two years spent in lecturing on temperance problems in Canada and the United States, he entered politics and was returned in 1882 to the Dominion House of Commons as a Liberal-Conservative from Kings Co., New Brunswick. His scholarship and his readiness and resourcefulness as a speaker and debater won him early recognition, and in December, 1885, he entered Sir John A. Macdonald's cabinet as Minister of Marine and Fisheries. In this office he was called upon to prepare the case for Canada to be presented to the joint commission in Washington which had been appointed to settle the long-standing dispute over the

deep-sea fisheries. His brief for Canada was an able presentation and left its impress on the Bayard-Chamberlain Treaty of 1888. In May, 1888, he became Minister of Finance and continued to hold this portfolio in the succeeding cabinets of Sir J. J. C. Abbott, Sir John Thompson, Sir Mackenzie Bowell, and Sir Charles Tupper, until the defeat of the last named in 1896. In 1896-1900 he represented York Co., New Brunswick, in the House of Commons, and after 1904 he sat for north Toronto. He was a delegate to the first Intercolonial Conference at Ottawa in 1892 and in 1895 supported a resolution in the House of Commons for the extension of the Dominion franchise to women. In 1903 he delivered a series of public speeches in England in support of Imperial trade preference. In 1911, after the defeat of the Laurier administration and the accession to the premiership of Robert Land Borden, Foster was appointed Minister of Trade and Commerce. He afterward visited the West Indies in the interest of improved trade between Canada and those islands. In 1914 he was knighted.

FOSTER, HENRY (1796-1831). An English navigator. He entered the navy in 1812, accompanied the commission on the northwest boundary between the United States and British North America, and made surveys of the mouth of the Columbia. In 1819-20 he sailed to South America and began his important observations with the pendulum. He was a member of the expedition to Greenland and Norway in 1823 and in the following year and again in 1827 sailed with Parry on his northwestern and polar voyages. The results of his observations on the variation of the needle were printed in the *Philosophical Transactions* (1826), and he received the Copley medal and the grade of commander for this work. In 1828 he started for the South Seas to make pendulum observations and to study ocean currents and meteorology. He rounded Cape Horn after observations near Montevideo, touched on the South Shetland Islands, where he made important gravity and pendulum observations, and after much cruising landed at Panama, and measured by rockets the meridian distance between Panama and Chagres. He was drowned in the river Chagres a day or so after. His observations on the figure of the earth, made at 16 stations, were completed in London by Baily. Foster's notebook was stolen, but his other papers were published by Webster in a *Narrative of a Voyage to the Southern Atlantic Ocean* (1834).

FOSTER, ISAAC (1740-81). An American physician and surgeon, born in Charlestown, Mass. He graduated at Harvard in 1758, studied medicine in Paris and London, and returned to practice at Charlestown. He was a delegate to the first Provincial Congress of Massachusetts in October, 1774, and on the outbreak of the Revolution gave up his large practice and joined the Continental Army as a volunteer surgeon. In the fall of 1775 he was appointed by Washington acting director general of the military hospital service of the American forces. He was personally attached to Washington's headquarters and in 1777 was surgeon in chief of the Eastern Department of the Continental armies. He resigned in 1780 on account of failing health.

FOSTER, JOHN (1770-1843). An English essayist, son of a weaver, born in the parish of Halifax, Yorkshire, and educated for the min-

istry at the Baptist college in Bristol. After preaching for several years to small congregations, he resolved to devote himself mainly to literature. In 1804 appeared his popular *Essays, in a Series of Letters*, in 1820 his celebrated *Essay on the Evils of Popular Ignorance*, in which he urges the necessity of a national system of education. To the *Eclectic Review* he contributed nearly 200 articles. Consult *Life and Correspondence*, edited by Ryland (London, 1846, republished in Bohn's Library, 1852).

FOSTER, JOHN GRAY (1823-74). An American soldier, born at Whitefield, N. H. He graduated at West Point in 1846 with McClellan and "Stonewall" Jackson, and served in the southern campaign of the Mexican War, being severely wounded at Molino del Rey. From 1855 to 1857 he was assistant professor of engineering at West Point and between 1857 and 1861 superintended the survey of the site of the fort at Willets Point, N. Y., and the construction of Fort Sumter and the repairing of Fort Moultrie in Charleston harbor. On Dec. 26, 1860, he was brevetted major for transferring the Federal garrison from Fort Moultrie to Fort Sumter, and on April 12-13, 1861, he assisted in the defense of Sumter. He superintended the construction of the fort on Sandy Hook, N. J., was raised to the rank of brigadier general of volunteers in October, 1861, and commanded a brigade during General Burnside's North Carolina expedition of January to July, 1862, receiving the brevet of colonel. He became a major general of volunteers in July, 1862, and commanded the Department of North Carolina until July, 1863, the Department of Virginia and North Carolina until November, 1863, and the Army and Department of the Ohio until February, 1864, and was brevetted brigadier general and major general in the regular army. He commanded the Department of the South and the Department of Florida in 1864-66, was mustered out of the volunteer service in September, 1866, and then as lieutenant colonel of engineers was on various important engineering works for the government, notably the improvement of Boston harbor and the construction of the defenses in Portsmouth harbor. Consult the sketch of his life by Noyes in *New Hampshire Historical Society, Proceedings*, vol. III (Concord, 1894-95).

FOSTER, JOHN WATSON (1836-1917). An American diplomat, born in Pike Co., Ind. In 1855 he graduated at Indiana State University and in 1857 was admitted to the bar. At the beginning of the Civil War he entered the Union service as a major of volunteers, and after attaining the rank of colonel headed a brigade in General Burnside's expedition to East Tennessee and was the first to occupy Knoxville (1863). In Evansville, Ind., he edited the *Daily Journal* in 1865-69 and was postmaster in 1869-73. In 1873-80 he was Minister to Mexico, in 1880-81 Minister to Russia, and in 1883-85 Minister to Spain. In 1891 he was engaged to assist President Harrison and Secretary Blaine in the negotiation of reciprocity treaties. During the Bering Sea controversy he acted as agent of the United States before the arbitration tribunal (1893). Upon the death of Mr. Blaine General Foster succeeded to the secretaryship of state (1892-93). Later he was legal adviser to the Chinese plenipotentiaries in their peace negotiations with Japan (1895); again represented the United States in the Bering Sea ques-

tion (1897), in 1898 was a member of the Anglo-American Joint High Commission to settle the disputes between Canada and the United States, in 1903 was agent for the United States before the Alaska boundary commission, and in 1907 was delegate from China to the Second Hague Conference. He published a biography of his father, Judge Matthew Watson Foster (1896), *A Century of American Diplomacy* (1900), *American Diplomacy in the Orient* (1903), *Arbitration and The Hague Court* (1904), *The Practice of Diplomacy* (1906), *Diplomatic Memoirs* (1909). He contributed an introduction to Mannix's *Memoirs of Li Hung Chang* (1913).

FOSTER, JOHN WELLS (1815-73). An American geologist and paleontologist, born at Bimfield, Mass. He graduated at Wesleyan University (Conn.) in 1834, removed to Ohio, studied law, and was admitted to the bar at Zanesville, but having spent his leisure in the study of geology, he accepted a position as assistant in the Geological Survey of Ohio in 1837, and was employed until 1844 in investigating the coal beds of the State. In 1847 he was assigned with Josiah Dwight Whitney to assist Prof. Charles T. Jackson in a geological survey of the Lake Superior region. Foster and Whitney completed the work alone, and the results of their investigations, which were of far-reaching importance both to science and to the commercial development of the country, were published by authority of Congress as *A Synopsis of the Explorations of the Geological Corps in the Lake Superior Land District in the Northern Peninsula* (1849), and *Report on the Geology and Topography of a Portion of the Lake Superior Land District in the State of Michigan. Part I, The Copper Lands* (1850), *Part II, The Iron Region* (1851). For the next few years Foster remained in Massachusetts, where he was active in the "Native American" movement and was associated with Henry Wilson in the organization of the Republican party in the State. In 1858 he removed to Chicago, where he lived for the remainder of his life, for some years holding the chair of natural philosophy in the old University of Chicago and devoting himself to scientific investigation, in particular to the paleontology and ethnology of the Mississippi valley. He was president of the American Association for the Advancement of Science (1869). Among his later published works are *The Mississippi Valley* (1869); *Mineral Wealth and Railroad Development* (1872), *Prehistoric Races of the United States* (1873).

FOSTER, JUDITH ELLEN (HORTON) (1840-1910). An American lecturer, born at Lowell, Mass. She removed to Iowa, studied law, and was admitted to the State bar in 1872. She also became superintendent of the Legislative Department of the Woman's Christian Temperance Union, and when that organization was affiliated with the Prohibition party, identified herself with the Non-Partisan Woman's Christian Temperance Union, of which she became president. She was a popular lecturer on various topics and published a *Constitutional Amendment Manual* (1882). In 1907 she was appointed a special agent of the Federal Department of Justice.

FOSTER, LAFAYETTE SABINE (1806-80). An American political leader, born in Franklin, Conn. He graduated at Brown University in

1828. He studied law, settled at Norwich, where he became editor of the *Republican*, and took an active part in politics as a Whig. He was elected to the Connecticut Legislature in 1839 and 1840 and was chosen to its sessions of 1846, 1847, 1848, and 1854 (in the latter three sessions acting as Speaker of the Assembly) and to that of 1870. In May, 1854, he was elected to the United States Senate by the combined votes of Whigs and Free-Soil Democrats. In 1856 he joined in the movement for the organization of the Republican party and in 1860 was reelected to the Senate as a Republican. During the entire Civil War he was chairman of the Committee on Foreign Affairs. In 1865 he was chosen President pro tempore of the Senate, and on the death of Lincoln and the succession of Johnson he became the acting Vice President of the United States. He declined to be a candidate for reelection in 1867, became a Liberal Republican in 1872, and two years later he was an unsuccessful candidate for Congress on the Democratic ticket. He was a judge of the Connecticut Superior Court from 1870 to 1876, in 1878 was on a commission on simpler court procedure, and in 1878-79 was a commissioner to settle the New York-Connecticut boundary dispute. Consult Campbell's *Memorial Sketch of Lafayette S. Foster* (Boston, 1881).

FOSTER, SIR MICHAEL (1836-1907). An English physiologist, born at Huntingdon and educated at London University. In 1869 he became professor of practical physiology there. A year afterward he accepted a similar position at Trinity College, Cambridge, and in 1883 was appointed professor of physiology at the University of Cambridge, holding this post till 1903. From 1881 to 1903 he was one of the secretaries of the Royal Society. In 1900 he was elected to Parliament as Liberal representative of London University, but was defeated in 1906. His publications include *Primer of Physiology* (1874); *Studies from the Physiological Laboratory in the University of Cambridge* (1876-77), *A Text-Book on Physiology* (1877), *The Elements of Embryology* (1874), with F. M. Balfour, *Course of Elementary Practical Physiology* (1876), with J. N. Langley.

FOSTER, MYLES BIRKET (1825-99). An English water-color painter and engraver, born at North Shields, Feb. 4, 1825. Early apprenticed to E. Landell, a wood engraver, he devoted some years to illustrating, first as an engraver and later making original designs on wood for the *Illustrated London News* and *Punch*. In 1846 he set up for himself and illustrated Gray's *Elegy*, *The Ancient Mariner*, *Old English Ballads*, Longfellow's *Evangeline*, and other works in poetry and prose, including etchings on steel for Milton's *L'Allegro* and *Il Penseroso* and Goldsmith's *Traveler*. About 1859 he began drawing in water colors and in 1862 was made a member of the Society of Painters in Water Colors, where he exhibited over 300 pictures, painted largely in body color and retouched by careful stippling until they acquired almost excessive finish. They are skillful in composition and show poetic feeling. His choice of subjects was drawn mostly from rural life, and he especially emphasized the landscape element. He became very popular, and his works were much reproduced in photographs and chromos. Among those well known are "Nutting," "The Bird's Nest," "Sailing the Boat," "Cows in the Pool," "Feeding the Ducks," "Castle of Rhein-

fels," "Birthplace of Burns," "In Full Cry," etc. At a later period he also painted in oils, but not with equal success. Consult Scherer, *The Brket Foster Album* (Munich, 1880), and biographies by Huish (London, 1890) and Cundall (ib, 1906).

FOSTER, RANDOLPH SINKS (1820-1903). An American Methodist Episcopal bishop, born at Williamsburg, Ohio. He studied at Augusta College (Millersburg, Ky) and entered the itinerant ministry of the Methodist Episcopal church in the Ohio conference in 1837. In 1850 he went to New York City as pastor of the Mulberry Street Church. From 1857 to 1860 he was president of Northwestern University, in 1868 he became professor of systematic theology in Drew Theological Seminary (Madison, N. J.), and in 1870 its president. He was elected Bishop in 1872 and made visits to the missions of his church in South America (1874), Germany and Scandinavia (1874 and 1883), India (1882), Italy (1883), and Mexico (1886). His publications include *Objections to Calvinism as it Is* (1848), *Christian Purity* (1851), *Beyond the Grave* (1879), *Centenary Thoughts* (1884), *Philosophy of Christian Experience* (1890), *Union of Episcopal Methodisms* (1892), *Studies in Theology* (6 vols, 1886-99), a remarkable series.

FOSTER, SIR ROBERT (1589-1663). An English jurist, the youngest son of Sir Thomas Foster, a judge under James I. He was called to the bar in 1610 and was knighted and made a justice of Common Pleas in 1640. An eager upholder of Charles, he condemned Captain Turpin (1644), but was merely removed from office by Parliament, while his colleague was impeached for high treason. During the Commonwealth he practiced as a conveyancer, and on the Restoration he was appointed Chief Justice of the King's Bench (1660) and dealt sternly with sectaries and political prisoners. He persuaded the King to approve the execution of Sir Harry Vane, and was justice at the trial of Sir Charles Sedley in 1663. Consult Foss, *Biographia Juridica* (London, 1870), and Campbell, *Lives of the Chief Justices* (ib, 1874).

FOSTER, ROBERT FREDERICK (1853-) An American authority on card games, born at Edinburgh, Scotland. Until 1893 he worked as an architect and civil engineer. In 1895 he became card editor of the *New York Sun*. He originated the 11 rule at bridge and invented whist markers and self-playing bridge and whist cards. His writings include *Foster's Whist Manual* (1890, 3d ed, 1894), *Whist Tactics* (1895), *Foster's Complete Hoyle* (1897, 1909), *Foster's Bridge Manual* (1900, 3d ed, 1908), *Foster's Bridge Tactics* (1903), *Bridge Maxims* (1905), *Practical Poker* (1905), *Call-ace Euchre* (1905), *Foster's Skat Manual* (1906), *Auction Bridge* (1908, 3d ed, 1910), *Cab No 44* (1910), a novel, *Royal Auction Bridge* (1912, 1914); *Cooncan* (1913).

FOSTER, STEPHEN COLLINS (1826-64). An American song composer, born at Lawrenceville, near Pittsburgh, Pa. Foster's musical gifts seem to have been natural, as he taught himself the flageolet when he was but seven. Many of his songs, the first of which, "Open thy Lattice, Love," was published in 1842, have become so popular that they may be regarded as veritable folk songs, for which reason it is fortunate that, although simple in technical treatment, they are, as a rule, refined and graceful

in their melody. "Louisiana Belle," "Old Uncle Ned," "My Old Kentucky Home," "Massa's in the Cold, Cold Ground," "Ellen Boyne," the famous "Old Folks at Home" ("Down on the Suwannee River"), "Come Where my Love Lies Dreaming," are some of the most popular of Foster's 175 published songs. His last song was "Beautiful Dreamer." Foster was improvident, and notwithstanding the enormous sales of his songs (e.g., "Old Folks at Home," 300,000 copies) was frequently harassed for want of money and obliged to sell his manuscripts outright for pitifully small prices. He died in New York.

FOSTER, STEPHEN SYMONDS (1809-81). An American Abolitionist, born at Canterbury, N. H. He was a carpenter for several years, then entered Dartmouth College with the intention of preparing for the ministry, and graduated in 1838. While studying at Union Theological Seminary, he became imbued with abolitionist ideas and gave up the ministry to become an antislavery advocate. He soon became widely known as an earnest and fearless orator. The refusal of the churches to cooperate in the abolition movement aroused his indignation, and he bitterly denounced both churches and clergy as hypocritical and non-Christian. His radicalism caused him frequently to be attacked by mobs, and his method of appealing to the people by entering churches during service and addressing the audiences unannounced gave rise to numerous grave disturbances and precipitated several riots. In 1845 he married Abby Kelley (see FOSTER, ABBY KELLEY). Besides articles on the slavery question in magazines, he published *The Brotherhood of Thieves: A True Picture of the American Church and Clergy* (1843, reprinted, 1886).

FOSTER, THEODOSIA TOLL (1838-) An American author, born at Verona, N. Y., and educated at Oneida Seminary. She married James H. Foster in 1869 and for many years was principal of the Home School at Verona. She wrote many stories under the pen name of "Faye Huntington." Her work includes *Mr McKenzie's Answer* (1876), *Ripley Parsonage* (1877), *From Different Standpoints*, with Miss Alden (1878), *Echoing and Re-Echoing* (1879, new ed, 1906), *Mrs Deane's Way* (1880), *Millerton People* (1884), *What Fide Remembers* (1885), *The Boynton Neighborhood* (1895), *A Modern Exodus* (1897), *His First Charge* (1897), *Leuis Elmore, Crusader* (1898), *Opportunity Circle* (1901), *A Break in Schedule Time* (1901), *Those Boys* (1903).

FOSTER, WILLIAM TRUFANT (1879-) An American educator, born in Boston. He graduated from Harvard University in 1901 and from Columbia University (Ph.D.) in 1911, taught English at Bates College (1901-03) and at Bowdoin (1904-10), after 1905 as professor of English and argumentation, and in 1910 became president of Reed College, at Portland, Oreg. In addition, he lectured on the principles of education at the Harvard summer session in 1909 and at Columbia in 1911. He was elected vice president of the American Federation for Sex Hygiene. Besides contributions to reviews and magazines, his publications comprise *Argumentation and Debating* (1908), *Administration of the College Curriculum* (1911), *Essentials of Exposition and Argument* (1911), *Social Hygiene and Morals* (1913), *The Social Emergency* (1914).

FOSTORIA A city in Seneca and Hancock counties, Ohio, near the boundary line of Wood County, 35 miles south by east of Toledo, on the Baltimore and Ohio, the Lake Erie and Western, the Hocking Valley, the Lake Shore Electric, the New York, Chicago, and St. Louis, and the Toledo and Ohio Central railroads (Map Ohio, D 3). It was settled by the father of Charles Foster, Governor of Ohio and Secretary of the United States Treasury in 1891-93, and by him was built up and made an important manufacturing place. It has several glass factories, flour mills, lime kilns, automobile and incandescent-lamp factories, a cooperage, spoke and bending works, planing mills, stave and barrel factories, carbon works, etc. In the vicinity are oil fields and productive farming country. The government, under a charter of 1889, is vested in a mayor, biennially elected, boards of public service and public safety, and a city council. Fostoria contains a Carnegie library and a fine Y. M. C. A. building, and owns its water works. Pop., 1900, 7730, 1910, 9597, 1914 (U. S. est.), 10,392.

FOTCHA. See FOCA.

FOTHERGILL, fŭth'ēr-gil, JESSIE (1851-91). An English novelist, born in Manchester, where her father was a wealthy cotton manufacturer. Her first novel, *Healey*, was published in 1875, and her great success, *The First Violin*, in 1877. Her novels, most of which depict life on the moorland and in the factory towns of the north of England, are remarkable for their powerfully drawn studies of character. Her published books, besides those mentioned, include *Aldyth* (1876), *The Wellfields* (1880), *Kith and Kin* (1881), *Made or Marred* (1881), *One of Three* (1881), *Peril* (1884), *Boerderland* (1887), *The Lass of Leverhouse* (1888), *A March in the Ranks* (1890), *Orville's Daughter* (1893). A dramatization of *The First Violin* (1904) by Sidney Bowkett was a success.

FOTHERGILLIA, fŭth'ēr-gil'i-a. A genus of hardy, ornamental shrubs belonging to the family Hamamelidaceae, closely allied to the witch hazel. The spikes of white flowers appear with or before the leaves early in the spring. There are two species natives of southeastern United States. The plants are propagated by seeds, which germinate the second year, or by cuttings, which require two years to root.

The name is also applied to the variety *fothergilli* of *Nerine curvifolia* grown in conservatories to a slight extent for its numerous brilliant red flowers, which are borne in umbels on long scapes. The flowers are especially attractive on account of their glistening in the light, as if sprinkled with hoarfrost. Owing to the habit of making growth during the winter and blossoming during the autumn, this plant, like others of its genus, has not become popular as a florist's flower, but is grown only in private greenhouses. See Colored Plate of AMARYLLIDACEAE.

FOTHERGILL PROCESS. A process in photography, devised in 1858 by Thomas Fothergill, which had for its object the preservation of sensitive plates ready for exposure. It consisted in the partial removal of the free silver nitrate which adheres to the collodion film when it is withdrawn from the sensitizing bath, as in the ordinary wet-plate process, by washing with water, and the subsequent conversion of the remaining free silver nitrate into silver aluminate

and chloride by pouring over the plate dilute albumen containing ammonium chloride, the excess of the albumen being finally washed off with water. The plates were set aside to drain on folds of blotting paper, and when dry were ready for use, keeping for some time. This process was supplanted by the use of dry plates coated with a gelatino-bromide emulsion.

FOTHERINGAY, fŭth'ēr-īn-gā, THE. The stage name of Emily Costigan (q.v.), in Thackeray's *Pendennis*.

FOTHERINGAY CASTLE. A famous castle which once stood near Peterborough, Northamptonshire, England. It was built in 1405 and was the birthplace of Richard III. In 1452 and the place of execution of Mary, Queen of Scots. It was demolished by James I.

FOTTINGER, fŭt'ing-ēr, HERMANN (1877-) A German engineer and inventor. He was born at Nuremberg, Germany, and was educated in the gymnasia of Nuremberg and the technical institute of Munich. In 1903 he received the degree of Ph.D. from the University of Munich for his dissertation on *Effektive Maschinenleistung und effektives Drehmoment und deren experimentelle Bestimmung* (1904). After 1899 he engaged in building ship machinery and in 1906 received the silver medal of the Shipbuilding Society for his turbine inventions (See STEAM TURBINE). In 1909 he became professor at the Royal Technical Institute of Danzig.

FOUCAULT, fŭ'kŏ', JEAN BERNARD LEON (1819-68). A French physicist. He was born in Paris and was educated for the medical profession. His early physical researches were carried on in connection with Fizeau, and the first direct measurements of the velocity of light were due to independent researches by these physicists. In 1850, in the course of his experiments, Foucault proved that the velocity of light in air was greater than in water. His apparatus consisted of a plane mirror capable of rapidly revolving about a vertical axis, and a concave mirror to which the light was reflected from the first mirror. An achromatic lens, a transparent mirror to reflect the light on to an eyepiece, and a source of light comprise the other essential features of the apparatus, which differed from that of Fizeau's in that it could be entirely contained in a laboratory and did not involve the reflection of the beam of light from a mirror far distant. In 1851 he demonstrated the rotation of the earth on its axis by the diurnal rotation plane of oscillation of a long pendulum with a heavy weight. The following year he invented the gyroscope (q.v.). In 1854 he was appointed physicist at the Paris Observatory. In 1857 he invented the polarizing prism known by his name and in 1858 succeeded in giving to the mirrors of reflecting telescopes the form of a spheroid or a paraboloid of revolution. He adjusted the great reflector in the telescope of the Paris Observatory in 1859. In 1865 he published a series of papers on a modification of Watt's governor, showing how its period of revolution could be made constant, and on an apparatus for regulating the electric light. He also showed how the sun can be observed without injury to the eye from the excess of light. He was scientific editor of the *Journal des Débats* from 1845. In conjunction with Regnault he published an important paper on binocular vision. He received the decoration of the Legion of Honor in 1850 and was made

an officer in 1864. For his biography consult *Léon Foucault, sa vie et son œuvre scientifique* (Brussels, 1879), and Lissajous, *Notice historique sur la vie et les travaux scientifiques de Léon Foucault* (Paris, 1875).

FOUCAULT CURRENTS, or **EDDY CURRENTS**. Induced currents of electricity generated in a plate or other mass of metal by its motion with regard to a magnetic field or by variations of that field. These currents circulate entirely within the metal, and their energy is expended in generating heat. They are known as Foucault currents, after this famous physicist, who demonstrated that when a copper disk was rotated between the poles of a strong electromagnet its temperature was greatly increased, though the currents thus produced had been previously observed by other investigators. They play an important part in electrical work, and their effect was first noticed in the construction of compasses where it was found that the magnetic needle would come to rest much quicker when it was placed above a plate of metal. That the currents were due to induction (q.v.) was shown by Faraday, and Foucault and others constructed interesting apparatus to exhibit their action. In the galvanometer a useful application is found when it is desired to damp the vibrations of the magnetic needle, so that it will return to a point of rest quickly through the action of the magnetic field generated by the induced currents in surrounding plates or masses of metal. The most important effects of Foucault currents occur perhaps in dynamo-electric machinery (q.v.), and in the armatures of dynamos and motors and the cores of transformers a laminated form of construction is employed and the different parts separated from each other, so that there will be no currents circulating as the armature revolves or the alternations of current occur. The greatest care in the design and construction is necessary in such cases in order to prevent the generation of a large amount of heat. See **DYNAMO-ELECTRIC MACHINERY**, **ELECTRICITY**, **INDUCTION**, **MAGNETISM**, **TRANSFORMER**.

FOUCAUX, ʃʊ'kə, **CHARLOTTE MARIE** (FILON) (1842-) A French author, the wife of Philippe Edouard Foucaux. Under the pseudonym of Mary Summer she wrote several works on Sanskrit literature, including *Histoire du Bouddha Sâkyamouni* (1874), *Contes et légendes de l'Inde ancienne* (1878), a work which was crowned by the Academy, and *Les héros de Kâldâsa et les héroïnes de Shakespeare* (1879). She also wrote several studies and romances of the Revolution and the Restoration, among which are *Le dernier amour de Mirabeau* (1877), *Les belles amies de M. de Talleyrand* (1880), *Une intrigante de la Restauration* (1888), *Quelques Salons de Paris au XVIIIème siècle* (1898).

FOUCAUX, **PHILIPPE EDOUARD** (1811-94). A French Orientalist, born at Angers. He was a pupil in Sanskrit of Eugene Burnouf at Paris, and from 1842 to 1852 directed a course in Tibetan at the Ecole des Langues Orientales. In 1852 he was appointed to occupy temporarily the chair of Sanskrit literature in the Collège de France and in 1862 succeeded Burnouf as titular professor. His publications include *Histoire du Bouddha Sâkyamouni* (2 vols, 1847-48), *Grammaire de la langue tibétaine* (1859), *Onze épisodes du Mahâbhârata* (1862); *Le religieux chassé de la communauté* (1873), *Lakṣa-Vistara*

(2 vols, 1884-92), and translations of several works of Kâldâsa.

FOUCHÉ, ʃʊ'shə', **JOSEPH**, **DUKE OF OTRANTO** (1759-1820). A French politician and Minister of Police. He was born at Pellerin in the Department of Loire-Inférieure, May 21, 1759. His father was a merchant captain, and the son was educated with a view to following the same calling, but early in life young Fouché decided for the church and, after attending the Collège of Oratorians at Paris, became a teacher at Jully, Arras, and Vendôme successively. In 1790 he had risen to be principal of the Collège of Nantes. As soon as the Revolution seemed likely to succeed, Fouché threw aside his ecclesiastical habit and was elected a deputy to the National Convention (1792) from Loire-Inférieure. At first he was a Girondin, but soon afterward joined the Jacobin party. No one was more ardent in bringing about the death of Louis XVI than Fouché, who took a leading part in the inauguration of the Worship of Reason, and in the spoliation of the churches which took place in 1793-94—a measure which replenished the coffers of the Republic. In October, 1793, he was sent with D'Herbois and Villers as commissioner to Lyons and showed himself a monster of cruelty, boasting publicly of the number of victims he had caused to be put to death. Excluded from the Jacobin Club by Robespierre, after he had held the presidency, because he mocked the former's theistic revival, Fouché was in danger of losing his life and was even arrested, but was released by the amnesty of Oct. 26, 1795. He was one of the chief men who finally brought about Robespierre's fall. He ingratiated himself with Barras and was sent as Minister Plenipotentiary to Milan. There he plotted against the Cisalpine Republic and was expelled, but immediately was sent as Ambassador to Holland. A few months later he was recalled and made Minister of Police, July, 1799. In this capacity he showed great vigor, he suppressed the newly organized Jacobin Club, under orders from Sieyès, and a large number of newspapers and created an extensive system of espionage. He was won over to the Bonapartist cause, however, participated in the coup d'état of the 18th Brumaire, and became Minister of Police under the Consulate. In the new government, strangely enough, he became the champion of moderation, by his advice the list of émigrés was closed, a general amnesty was proclaimed, and a policy of conciliation steadily pursued. He was forced to resign his office in 1802, because Bonaparte feared his power and cunning. He was raised to the Senate with a large pension, but he still kept up a police system of his own, and in 1804 was reappointed to his former place on account of the many plots against the life and power of Napoleon. It was at this time that he made his famous remark on the execution of the Duc d'Enghien: "It is worse than a crime, it is a blunder."

Under the Empire Fouché was Minister of the Interior as well as head of the police and controlled the internal government of France during the frequent and prolonged absences of the Emperor. In 1808 he received the title of Duke of Otranto. In 1809, on the occasion of the landing of English forces at Walcheren, he issued a proclamation calling on France to show that she could repel the invader without the presence of the Emperor. The proclamation had

the desired effect, but it so incensed Napoleon that Fouché was deprived of the portfolio of the Interior, and shortly afterward interference in diplomacy cost him his office as Minister of Police (1810). He had to flee from France because he refused to give up secret papers in his possession. Later he was allowed to return and reside on his estate at Pont Carré. In 1813 he was sent as Governor to the Illyrian Provinces, but after the battle of Leipzig was recalled and sent to Naples to watch Murat. Fouché, however, had been in secret negotiations with the Bourbons for some time and did little to prevent Murat's defection. In 1814, on returning to Paris, he was welcomed by Louis XVIII and offered the police portfolio, but declined. He foresaw the return of Napoleon from Elba and during the Hundred Days resumed his police functions, though at heart a traitor to the cause he espoused. He always looked ahead and made sure of his own future before committing himself irretrievably to one master. After Waterloo he went over to the Bourbons and aided in the pacification of the country as Minister of Police, but the law against the régicides in 1816 exiled him from France. He retired to Prague, became an Austrian subject in 1818, and spent his last years at Trieste. There is no good single work on Fouché. His *Mémoires* (4 vols., Paris, 1822-24, Eng. trans. 1904 et seq.), while based on genuine documents, have been declared a forgery by his family. For various aspects of his career consult Madelin, *Fouché, 1759-1820* (Paris, 1901), Forques, "Le dossier secret de Fouché" in *Revue Historique*, vol. xc (Paris, 1906), D'Hauterive, *La police du premier empire* (Paris, 1908).

FOUCHER, fōō-shā', JEAN (1508-67). An explorer and colonizer in South America. He was born at Cambrai, Flanders, became a sailor, and accompanied Sebastian Cabot on the voyage to South America which resulted in the discovery of the Paraguay River. He remained at the mouth of the Plata until 1529 and joined the Spanish expedition of Mendoza to Paraguay in 1534, as pilot. After the founding of Buenos Aires he led an exploring party inland, made an adventurous journey as far as the base of the Cordilleras in Peru, and returned to the eastern coast in 1539. He became one of the advisers of Cabeza de Vaca, the Governor, whom he induced to adopt a friendly policy towards the natives, and with whom, in 1544, he was imprisoned and sent back to Spain. In the following year he was pardoned and returned to South America, where, as Governor of Entre Ríos, he continued his explorations and did much to establish friendly relations between the colonists and Indians.

FOUCHER DE CAREIL, fōō-shā' de kā'rā'y', LOUIS ALEXANDRE, COUNT DE (1826-91). A French diplomat and author, born in Paris. In 1872 he became Prefect of the Department of Seine-et-Marne and in 1876 a member of the Senate, and in 1883-86 was Ambassador at the court of Vienna. A recognized authority on the philosophy of Leibnitz, he wrote a series of expository volumes, including: *Réfutation inédite de Spinoza par Leibniz* (1854), *Leibniz, la philosophie juive et la Cabale* (1861), *Leibniz, Descartes et Spinoza* (1863), and worked on an edition of the *Œuvres de Leibniz* (1859 et seq., 2d ed., 1867 et seq.), to include 20 volumes, of which only seven appeared, which followed his *Lettres et opuscules inédits de Leibniz* (1854-57).

FOUCQUET See FOUQUET

FOUGÈRES, fōō'zhār'. The capital of an arrondissement in the Department of Ille-et-Vilaine, France, situated on a hill on the Nançon River, 28 miles northeast of Rennes (Map France, N, D 4). It is a handsome, well-built town and in the old quarter retains mediæval traces in the ancient houses with arcades which overhang the sidewalks. The castle of Fougères, a picturesque object, was at one time considered the key to Brittany. The churches of St Sulpice and of St Leonard have many interesting features, a college and three hospitals are among the principal public buildings. In the neighborhood is a great forest containing prehistoric megalithic and Celtic remains. The town has flourishing dye works, tanneries, and glass works. Pop., 1901, 20,952, 1911, 13,753. Fougères is celebrated for the engagement which took place in the vicinity between the Vendéan Royalists and the Republicans, Nov. 15, 1793.

FOUILLÉE, fōō'ya', ALFRED JULES EMILE (1838-1912). A French philosopher, born in La Pouéze, Maine-et-Loire. He began his career as a teacher in the colleges of Louhans and Auxerre and the lycée of Carcassonne and was afterward professor of philosophy at Douai and Montpellier. For three years (1872-75) he held an important position in the normal school at Bordeaux, but, when forced by ill health and failing sight to retire in 1875, he devoted himself to the production of treatises upon the philosophies of Plato and Socrates, a *Histoire de la philosophie* (1875, 7th ed., 1894), *La science sociale contemporaine* (1880, 5th ed., 1911), *La propriété sociale et la démocratie* (2d ed., 1904), *Critique des systèmes de morale contemporaine* (4th ed., 1899), *L'évolutionisme des idées-forces* (1890, 5th ed., 1899), *La psychologie des idées-forces* (1893), *Descartes* (1893), *Psychologie du peuple français* (2d ed., 1898), *La France au point de vue moral* (1900), *Nietzsche et l'immoralisme* (1902), *Esquisse psychologique des peuples européens* (1903), *Le moralisme de Kant et le moralisme contemporain* (1905), *La morale des idées-forces* (1907), *Le socialisme et la sociologie reformiste* (1909), *Le pensée et les nouvelles anti-intellectualistes* (1911), *Esquisse d'une interprétation du monde* (1913), ed. by Boirac. He also contributed to the *Revue des Deux Mondes* and the *Revue Philosophique*. *Education from a National Standpoint* (1892) is a version in English by Greenstreet of Fouillée's work on education. He has attempted a synthesis of Platonic idealism and modern evolution in a theory of "motor ideas" (*idées-forces*) or "will to live" (*vouloir vivre*) conditioning psychical and physical progress. His wife, formerly Madame Guyau, mother of the philosopher Jean Marie Guyau (q.v.), wrote children's books (under the nom de plume of "G. Bruno"), notably *Le tour de la France par deux enfants*. Consult Guyau, *La philosophie et la sociologie d'Alfred Fouillée* (Paris, 1913).

FOUL BREATH See BREATH, OFFENSIVE

FOUL BROOD See BEES, DISEASES OF

FOULD, fōōld, ACHILLE (1800-67). A French financier and statesman. He was born in Paris, Nov. 17, 1800, of Jewish parents and was educated at the Lycée Charlemagne. Fould came naturally by his financial gifts, his father being a wealthy banker of Paris. In 1842 he began his political career as a member of the Council General of the Department of Hautes-Pyrénées,

and was immediately after elected a deputy for Tarbes, the chief town of that department. In the Chamber of Deputies he acquired a high reputation for the ability with which he handled questions of finance, and in 1844 was appointed reporter to the commission on stamps on newspapers. At that time he was a staunch supporter of Guizot. After the revolution of 1848, however, he accepted the new regime and offered his services to the provisional government. In July, 1848, he was elected to the Constituent Assembly for the Department of the Seine and rendered valuable services to the government, in particular by advising against the issue of assignats. In this year he wrote two papers on this subject *Pas d'Assignats* and *Observations sur la question financière*. During the presidency of Louis Napoleon he was four times Minister of Finance, where he played an important part in the reforms undertaken and in the opposition to free trade. He once more resigned his position in January, 1852, in consequence of the decree ordering the confiscation of the property of the Orléans family. The same day, however, he was created a senator, and shortly afterward returned to power as Minister of State. In this capacity he superintended the Paris Exposition of 1855 and the completion of the palace of the Louvre. In 1857 he became a member of the Academy of Fine Arts. He remained one of the confidential ministers of Napoleon III till December, 1860, when he was succeeded as Minister of State by Count Walewski. In November, 1861, he was reappointed Minister of Finance and held office until January, 1867. He died October 5 of the same year at Tarbes. His three sons were all prominent in French politics.

FOUL IN THE FOOT. See FOOT ROT. The name has been applied also to tubercular foot rot, tubercular disease of the bones, and canker (q v).

FOULIS, fow'lis, ROBERT (1707-76) and **ANDREW** (1712-75). Two eminent printers of Glasgow, brothers. Robert, the elder, for some time practiced as a barber—in those days a profitable and respectable profession. His abilities attracted the notice of the celebrated Dr Francis Hutcheson, then professor of moral philosophy in Glasgow University, who advised him to establish a printing press. Accordingly he spent 1738-39 in England and France with his brother Andrew, who apparently had been designed for the church and so had enjoyed a better education. In 1741 he started in business in Glasgow as a printer, his first publications were chiefly of a religious nature. In 1743 he was appointed printer to the university. In this year he published an elegant edition in octavo of *Demetrius Phalereus on Elocution*, supposed to be the first Greek work printed in Glasgow. In 1744 he brought out his celebrated immaculate edition of Horace (small 8vo). Each printed sheet of this was hung up in the college at Glasgow, and a reward was offered for the discovery of any inaccuracy. But, in spite of all efforts, six errors remained. Soon after he took his brother Andrew into partnership, for 30 years they continued to bring out, particularly in the Latin and Greek classics, some of the finest specimens of correct and elegant printing which the eighteenth century produced, either in Great Britain or on the Continent. Among them were Cicero's *Works* (20 vols.), Caesar's *Commentaries* (folio),

Homer (4 vols), Æschylus, Herodotus (9 vols), an edition of the Greek Testament, Vergil, Gray's *Poems*, Pope's *Works*, a folio edition of Milton, and other publications in English. In all over 550 publications came from their press. To promote the cultivation of the fine arts in Scotland, Robert Foulis, after a two years' visit to the Continent in preparation, commenced, in 1753, an academy at Glasgow for the instruction of youth in painting and sculpture. The expense attending this institution proved too great, and the printing business declined, but continued to be carried on till the death of Andrew. In 1776 Robert exhibited and sold at Christie's, Pall Mall, London, the remainder of his paintings, in the hope of recouping his broken fortunes, but after all expenses were defrayed the balance in his favor amounted to only 15 shillings. He died the same year at Edinburgh, on his return to Scotland. For a catalogue of the publications of the Foulis brothers, consult Duncan, *Notices and Documents Illustrative of the Literary History of Glasgow* (Glasgow, 1831), consult also Tadder in *Dictionary of National Biography*, vol. xx (London, 1889), and Murray, *Robert and Andrew Foulis and the Glasgow Press* (Glasgow, 1913).

FOULK, fōlk, GEORGE C. (?-1894). An American naval officer and diplomat. He was born in Pennsylvania in the early sixties and entered the United States Naval Academy at Annapolis at 14, graduated four years later at the head of his class, and as ensign served in the United States navy on the Asiatic Station. In addition to the ordinary routine of his profession he mastered the Japanese language and subsequently the Korean. He was detached in 1883 to serve as interpreter and secretary to the Korean Embassy, the first ever sent to Western countries. Arriving in Seoul in June, 1884, he was made naval attaché to the United States Legation and at government instance made a journey through the country, publishing in the *United States Foreign Relations* his report. He enjoyed the confidence of the King and the progressive men and on their behalf brought out military instructors and school-teachers from the United States and aided in the formation of a stock farm and breeding station. Though foreseeing the political storm which broke Dec 4, 1884, he made a journey in the southern provinces, and after many dangers and hairbreadth escapes he reached Seoul, acting as chargé d'affaires *ad interim* for 18 months, the youngest man ever intrusted with the duties of a minister from the United States to a foreign country. Reentering the service of the navy, he later resigned, married a Japanese lady, and became professor of mathematics in the Doshisha University in Kyoto, where he died in 1894.

FOULKE, WILLIAM DUDLEY (1848-) An American civil-service reformer and author, born in New York City. He graduated at Columbia College in 1869 and at Columbia law school in 1871, was admitted to the bar in 1870, and practiced in New York City until 1876. In Richmond, Ind., he was for 15 years an attorney of the Pittsburgh, Cincinnati, and St. Louis Railway and for one year (1883) an editor of the *Palladium* and afterward of the *Evening Item*. About 1890 he retired from the bar. He was a member of the Indiana State Senate in 1883-85, in 1885 introduced a bill to establish civil-service reform in Indiana, and organized and became

president of the Indiana Civil-Service Reform Association. His investigations into the management of the State Hospital for the Insane revealed grave maladministration, due principally to the spoils system. In the interest of the National Civil-Service Reform League, as chairman of a special commission, he conducted in 1889-90 investigations of the Federal civil service. He was United States Civil Service Commissioner in 1901-03 and president of the National Municipal League from 1910 to 1913. His publications include *Slav or Saxon* (1887, 3d ed., 1904), "Civil-Service Reform: Its Later Aspects" (*Economic Tracts*, No 31, 1890), "The Present State of our Civil Service" (in *Publications of American Social Science Association*, 1891), "The Theory and the Practice of Civil-Service Reform" (in *Proceedings of National Civil-Service Reform League* for 1894), "Proportional Representation: An Address before the Municipal League of Boston" (*Publications of the League*, No 4, 1896), a biography (1898) of Oliver P. Morton, war Governor of Indiana, *Maya, a Story of Yucatan* (1900), *Protean Papers* (1903), a translation (1906) of Paulus Diaconus' history of the Langobards, *Dorothy Day*, a novel (1911), *Maya: A Dramatic Poem* (1911).

FOULLON, fōŭ'lōn' (often wrongly spelled FOULON), JOSEPH FRANÇOIS (1717-89). A French administrator, born at Saumur. He was Intendant General of the Army during the Seven Years' War and became in 1771 Intendant General of Finance. Possessor of great wealth through marriage with the daughter of a rich Dutch family, in the popular mind he became the personification of all that was detestable, avaricious, and hard-hearted, being nicknamed "Familiar Demon (*Ame Damnée*) of the Parliament," although actually he was generous and sympathetic and in 1788 gave 60,000 francs to sufferers from cold and famine. He was active in furthering the measures for the defense of the crown at the outbreak of the Revolution, and on July 12, 1789, was appointed Minister of the King's Household, succeeding Saint-Priest, when Necker was dismissed. He attempted to trick the Paris mob by a story of his death and by an elaborate funeral (really of one of his servants). The ruse was unsuccessful. He was caught at his estate, Vitry, near Fontainebleau, and was brought back to Paris. He was dragged through the streets with a bunch of hay stuffed in his mouth—because it was believed that he had said "Let the people eat grass"—and in spite of the pleas of Lafayette was hung to a lamp-post (July 22). Possibly his death, like Berthier's, was not the result of popular fury alone, for Mirabeau's correspondence proves that assassins had been hired to murder both. Consult Chassin, *Les élections et les cahiers de Paris en 1789* (Paris, 1889).

FOUL PLAY. A romance by Charles Reade and Dion Boucicault, published in London, 1869.

FOULKES. See FULK.

FOULKES, fōŭlk, or FUL'CO, of NEULLY. A famous pulpit orator of the twelfth century, the preacher of the Fourth Crusade. His early life was careless, but he experienced a sudden conversion and, ashamed of his ignorance, went to Paris to study. Here his earnestness attracted attention, and he was encouraged to preach. He commenced a series of journeys, exhorting to repentance, and by the rigor of his

asceticism enforcing his sermons. He began to preach the Crusade in 1198. In 1201 he asserted that he had induced 200,000 to accept the cross. He did not live to hear of the result, for he died at Neuilly, March, 1202. Consult Villehardouin, *La conquête de Constantinople*, ed by Wailly (Paris, 1874).

FOUL WEATHER, CAPE. See CAPE FOUL WEATHER.

FOUL-WEATHER JACK. A nickname given to the English Admiral John Byron (1723-86), on account of his ill luck at sea, whether sailing or fighting. He was wrecked in the *Wager* (1740) and afterward made a hazardous voyage around the world.

FOUNDATION (from Fr *fondation*, Lat *fundatio*, from *fundare*, to found, from *fundus*, bottom). The word is used, both in the concrete and abstract, to denote the base on which anything is supported. In relation to a building the term is often used to denote either the construction below grade (or ground surface) or the natural material on which the construction rests. The modern tendency, and advisably so, is to use the word in the former sense and to designate the supporting material as the foundation bed, and the terms will be so used in this article. The footings are the lower courses of the foundation, which are offset to give greater bearing area. The importance of correctly designing the foundation and proportioning the area of the foundation bed is evident, for on them does the integrity of the structure depend. No branch of engineering requires greater practical experience, for in the superstructure the materials are of uniform character, and their physical properties and allowable stresses are well known, while no such uniformity exists in those which compose the foundation bed, and the conditions under which they are found are so varied that no definite values can be given in relation to them.

Historical. The buildings of ancient primitive races were naturally of inferior character, and we find no remains of such construction with the exception of the pile foundations of the lake dwellers. These people constructed dwellings over the shallow waters of lakes throughout Europe from the Stone age down to the time of the Romans. These foundations are interesting as being the earliest use of piles, but it is to be noted that they were employed more as a means of providing the necessary construction below water than in the modern use of increasing the bearing value of the foundation bed. In fact the piles were often driven through holes in planks, the planks acting as a spread footing in giving additional bearing surface on the mud. In many other cases, however, the piles were driven through the mud to the underlying marl. In general, they are now in a poor state of preservation, often being worn entirely away above the mud bottom of the lakes by the action of waves and lake currents. Some piles have been found and pulled up, apparently of their original size, though the wood had deteriorated into a brittle condition. The piles generally were from 4 to 6 inches in diameter—though they have been found up to 14 inches—and from 8 to 16 feet long. They were pointed at the lower end and were driven by large wooden clubs.

The Egyptians, while of a much more advanced civilization, in point of time antedated the lake dwellers, and the pyramids and some of the adjacent temples are the oldest work of man in a

fair state of preservation. These great monuments are founded on rock and bear the testimony of centuries that good bedrock is unequaled for a foundation. The pyramid form in itself tends to permanency, and for this reason even greater demonstration of the value of a rock foundation bed is given by the temples. The granite one at Gizeh was in fair condition down to historical times, and the temple of the pyramid at Medum was discovered 25 years ago in a perfect state of preservation. The Egyptians' finest construction was that of the fourth dynasty, their work deteriorating after that time. In general, their foundations consisted of a foundation of stone or of sun-dried bricks started a few feet below the ground surface. This was also the usual construction of the Assyrians and Babylonians, but both of these nations used great quantities of baked bricks laid in a mortar made from bitumen. The bricks of Nebuchadnezzar were 12 to 13 inches square and $3\frac{1}{2}$ inches thick and of such good quality that they are still largely used for buildings in Hillah and Bagdad.

The foundations of the Greeks seem to be but a slight advance on their predecessors. The Romans were the great engineers of their time, and many methods now in use date from them. They were skillful in subaqueous construction and used piles and cofferdams of single and double walls—pumping out the latter before laying the masonry—and other special methods of foundation construction. They used concrete extensively and made hydraulic cement by mixing pozzuolana and lime and invented pile drivers. The foundations of buildings in the Forum are probably the oldest example of those built on poor soil. They consisted, in general, of massive footings of concrete or masonry, in some cases the layer of concrete extended over the entire area covered by the building and was many feet in thickness. The writings of Vitruvius are the oldest existing books on engineering and give us an accurate idea of Roman science of construction. He gives many rules and methods to be followed in the design and execution of structures. Interesting features are his proportions for retaining walls and his belief in the necessity of charring piles before driving to prevent deterioration, this latter being at variance with modern practice for piles below water.

General Requirements. The function of a foundation is to support safely the loads brought upon it by its own weight and those of the superstructure. Safety does not require that no settlement shall occur, but it does require that it be uniform. Unequal settlement causes excessive strains throughout the structure, producing cracks and other defects, and may result in the collapse of the building. As it is difficult to obtain uniform settling, it is better to make the foundation as unyielding as practicable. The character of the subsoil having been determined, the depth to which the foundation is to be carried must be decided. The footings may be sufficiently spread to be safely supported on a stratum of low bearing value, but it may be cheaper and is generally safer to excavate down to a firmer layer, where less area will be required. In general, the deeper foundation at the same cost is to be preferred, and especially so in city work, where there is danger of a disturbance to the soil from adjoining building operations. The loads of the walls, columns, piers, etc., must be distributed over the required area, which is

accomplished by means of the various types of foundations, hereinafter described.

Principles of Design. In the design and construction the following principles should be observed: 1 The action of frost and the percolation of water should be prevented by starting the footings below frost line on a stratum free from seepage, or, if the latter is not feasible, a system of drains may be used to divert the flow of water. 2 The materials of construction should be proof against deteriorating influences or made so by some protective covering. Wood continually wet, brick or masonry laid in cement mortar, concrete, and steel protected from moisture meet this condition. 3 The foundation bed should be at right angles, or nearly so, to the line of pressure. If the stratum to be built on is inclined, it is not necessary to level off the whole area, the same effect being produced at less cost by cutting a series of rough steps. 4 The unit load on the foundation bed must not exceed the safe supporting, or "bearing," value of that material. This is accomplished by making the area of the footings of the proper size. When the allowed unit of bearing and the weight of the superimposed load are known, the required area is given by a simple process of division. The loads to be supported generally can be calculated readily, but the determination of the bearing capacity of the soil is a matter requiring skill and much experience on the part of the engineer and is one of the chief problems in substructure work.

Allowable Loads on Various Materials. Owing to the infinite number of variations in the material encountered and the conditions affecting it, no definite values can be given. Even for the same material under the same conditions, the allowable unit will vary with the type of building to be erected—a much higher value may be used for a comparatively broad low structure than for a high narrow one, as a chimney, where a slight settlement would be dangerous. It is obvious that for economy the greatest safe-bearing value of the soil must be used, which can only be determined by practical experience supplemented by tests. A knowledge of geology is of material assistance in making a proper estimate of the character of the foundation bed. However, a fair idea of the relative value of safe loads per square foot on usual foundation beds may be obtained from the following figures: rock, 20 tons and upward, gravel, 6 to 8 tons, clay, dry, 3 to 5 tons, sand, 2 to 4 tons. Clay, if wet, becomes soft and plastic and therefore liable to settle under very small loads. The value of sands depends on the conditions restraining its tendency to flow under pressure. If perfectly confined, as in a surrounding cylinder, it will sustain very large loads, if entirely unrestrained and subjected to a flow of water, it is almost as unstable as the water itself.

Ordinary Footings. The most primitive form of foundation consists of a wooden timber laid directly on the ground, with the studs and floor beams resting on its top. As the bearing surface is small and as it rots after a few years, this construction is obviously applicable only for unimportant or temporary structures, such as sheds. An improvement is effected by blocking up the timber on occasional stones, increasing the life of the sill. The bearing area may be increased by using a continuous course of stones, which is the usual construction for barns. The typical foundation for dwelling houses is a

development of the foregoing, the course of stones being replaced by a masonry, brick, or concrete wall extending below the cellar floor or at least below the frost line. The wall is often started on a footing course to give greater bearing area.

Spread Footings. For heavier structures a wider footing is obtained by sloping the foundation wall outward towards the bottom, or by using a number of projecting courses, thus making the wall a series of footings. The same result is often produced by special methods, as a steel grillage or a reinforced concrete slab or mat. The allowable angle of slope or amount of offset depends on the material used and the unit load supported. This value is sometimes given by building codes of cities, but it is necessarily unreliable for general application, and a calculation should be made for each case. If owing to adjoining buildings the projections may be made only on one side, the effective limit of total offset is reached when the footing course is about one and one-half times the thickness of the wall above the top offset, or beginning of the batter. If made more than this, there will be little or no pressure under the toe, and that under the heel will be correspondingly increased. This is a fact that has often been overlooked by builders, and settlement from this cause is not unusual. If, however, the projections may be made equally on both sides, any width of footing may be obtained by going deep enough. The cost of deep excavation and of the large amount of masonry required economically limits this type of footing when resting on ordinary ground to buildings not exceeding five to seven stories.

Steel Grillage. The application of steel to building construction has developed a modification of the spread footing by which one or more layers of steel beams or girders are used to obtain a shallow footing of the required area and strength, the beams of each course being set on and at right angles to those of the layer below. The steel should be thoroughly protected from moisture by being embedded in concrete. Steel rails and even wooden planks were formerly used as an expedient, but the beams are stiffer and better. The large area which may be obtained by this method makes it adaptable for heavy loads, and it has been successfully used for buildings of 20 stories, in which cases the grillage may extend over the entire area covered by the building. The objection to such a foundation is that any disturbance of the adjoining soil may cause a flow or yielding of the supporting stratum and cause dangerous settling. If the grillage is used for a wall footing, there is only one layer of beams, which are placed at right angles to the line of the wall. This method has been largely used in Chicago, and a typical foundation for a column is shown in Fig 1.

Deep Foundations. When the material at the level at which spread footings would ordinarily be constructed is not suitable, or in case a greater depth is desirable for any reason, such as protection from future adjoining excavations, it is necessary to carry the foundations down to an underlying stratum of greater supporting power. Recourse must then be had to the use of piles or to special methods of excavating and construction.

Pile Foundation. In its essentials a pile foundation consists of a number of piles sunk into the ground and carrying on their tops a platform of timber or concrete. Piles are of

timber, iron, or concrete. Iron piles are usually either screw piles or disk piles. A screw pile consists of a shaft, usually of iron, but sometimes of wood, having at its foot an iron casting provided with one or two turns of a screw, the blades of which vary from $1\frac{1}{2}$ feet to 5 feet in diameter. In disk piles the screw blades are replaced by a circular iron disk. Timber piles are round tree trunks with the knots and roughness dressed off. The method of sinking piles varies with their form. Iron screw piles are driven by screwing them into the foundation soil, timber piles are driven by means of hammers or the water jet, and disk piles are driven by the water jet. (See PILE.) The supporting

FIG 1 TYPICAL COLUMN FOUNDATION

power of piles is due either to their acting as a column whose lower end rests upon a hard stratum, or to the friction of the earth upon the side of the pile, or to a combination of both of these actions. Various mathematical methods are employed for calculating this supporting power, which varies with the character of the soil and the depth of the pile. At best the supporting power of piles can only be approximated, and it is customary to load them only to a fraction of their supporting power in order to avoid chances of failure. The number of piles to be used in any particular foundation will depend upon the weight to be supported and other load conditions, but it is seldom practicable to drive them closer together than $2\frac{1}{2}$ feet centre to centre.

After being driven, the tops of the various piles are cut off to a common level, and they are ready for the construction of the platform or capping. If a timber platform is used, it usually consists of one or more courses of timber

fastened to the tops of the piles and planked or floored over. If concrete is employed, the earth is excavated between the piles to a level slightly below their tops, and the resulting spaces are filled with concrete. On top of the piles and the previously placed concrete a layer of concrete is carried up, thick enough to cover the tops of the piles and to form the footing course, or platform on which the remainder of the foundation structure is built. In order that wood may endure it must be permanently dry or continuously wet. As the former is impracticable, the latter condition must be maintained, and for this reason the tops of wooden piles must be kept below water level. Their use is, therefore, limited to locations where the water level is at no great distance below the required depth of footings, as otherwise there will be an excessive cost for excavation. In cities the ground water level is liable to vary, due to pumping or artificial drainage or other change of conditions, and in several instances it has receded sufficiently to cause the rotting of the tops of piles in the vicinity, thereby causing the settling of buildings supported on piles.

Concrete Piles. Piles made of concrete are now largely used, and are applicable to all places where wooden ones can be driven and also to those places where wood would deteriorate, such as above a permanent water level or where the teredo exists. Due care, however, should be taken to prevent the action of frost on wet concrete. The piles are generally reinforced with steel rods embedded in the concrete forming the pile. They are sometimes cast, or "formed," complete in removable wooden forms and allowed to harden and attain strength above-ground before driving, in which case they are placed and driven like wooden piles. They may otherwise be constructed in place by driving a hollow cylindrical steel shell to the required depth, in which the reinforcing rods may then be inserted and the concrete deposited. In the Raymond method a light steel shell reinforced by a steel mandrel is used. The mandrel, designed to give the required strength during the driving operation, is withdrawn before concreting, and the outer shell is left in place to act as a form. In the Simplex method a heavier shell is used, which is gradually withdrawn as the concrete is placed, so that on the completion of the pile the shell has been entirely removed and may be used over again.

Methods of Excavation. When foundation piers or walls must be carried down to a considerable depth, special methods of excavation are required to prevent the inflow of water or surrounding material. The construction to prevent this inflow varies with the great variety of conditions encountered, and many different types are in use, but the methods may be broadly divided into three classes: (A) cofferdams, (B) caissons, (C) the freezing process. Cofferdams are temporary structures inclosing the space to be occupied by the foundation and are often removed on the completion of the work. Caissons are permanent structures forming an integral part of the foundation and are used as a means of placing the foundation in position, in general, they are large water-tight boxes within which excavation can be made below the water or ground surface. Caissons are often surmounted with cofferdams, so that the surrounding temporary construction above ground or water level

may be readily removed, exposing the finished surface of the pier. On this classification cofferdams comprise (1) sheet piling, (2) the poling board, (3) the Chicago method, and (4) cofferdam for subaqueous work. Caissons comprise (1) box caissons, (2) open caissons, (3) pneumatic caissons.

Sheet Piling. Ordinary wooden sheet piling, or sheeting, consists of a continuous line of vertical planks held against the side of the excavation by horizontal timbers known as waling, or breast timbers, these in turn being supported either by cross braces extending across the excavation to the opposite waling timber or by inclined struts extending to the bottom of the excavation, where a support is provided in the undisturbed material. The sheeting planks may be square-edged if the material has some cohesion, but where water or running sand is to be excluded the planks should be tongued and grooved or splined. The sheeting was formerly driven by using ringed wooden mauls, and this is still usual for small work or for moderate depths of drive, but where the amount of driving is considerable, power hammers operated by compressed air or steam are now used. If the required depth cannot be reached by the first set of planks, or "drive," a second and some times a third and fourth set are used. In practice, a shallow excavation is first made to the proper line for the outside of the sheeting, the top breast timber is temporarily secured in place, and the planks are placed vertically between the timber and the bank. As the excavation progresses, the planks are successively driven down a few inches in turn so as to follow the excavation. Additional waling or horizontal timbers and braces are added as required. Sheeting made of steel is now being largely used in place of wood. It has the advantage that it can be driven in advance of the excavation, reducing the likelihood of any flow of material under it. It has greater strength and can be driven to greater depths and often may be drawn and used over again. As generally manufactured, it is interlocking, so that there is less danger of its getting out of line and having open spaces causing leaks.

Poling-Board Method. The poling-board method is largely used in mining operations and has occasionally been used in deep pits for piers. It differs from the sheet-piling method in that the sheeting used is in relatively shorter lengths and is not driven vertically but with a slight outward flare. The various supporting breast timbers, or "sets," are placed vertically over each other, at a distance apart slightly less than the length of the planks, or poling boards. The bottom of each poling board is outside of the breast timber, and the top is inside and nailed to it, successive sets of poling boards slightly overlapping.

Chicago Method. This method differs from that of ordinary sheet piling, as the excavation is first made, and afterward the sides of it are supported. It is best adapted to a circular form, and consequently when it is used the piers are made of that shape. In its operation a circular excavation, slightly in excess of the size required for the pier, is carried down to a depth of 5 feet, great care being taken to make the sides vertical and true to the circle. Vertical planks, or lagging pieces, 5 feet long, having their edges slightly beveled, are set and held in place by two or more steel rings. The

lagging pieces are wedged against the walls of the excavation by driving wedges between the rings and the plank. The excavation is then made for another section, the lagging being put in and secured in the same manner, and the

type consists of a double line of sheet piling with the space between filled with puddled clay, but where the water is still and shallow a simple bank of earth or of bags of clay is often used. Such cofferdams may be used successfully only where they are not subjected to a high head of water.

Box Caissons, or Crips, are used where no excavation is required after the sinking of the box, and where the surface on which it is to rest may be prepared previously by dredging. This type consists of a box open at the top and closed at the bottom. It is generally built at some convenient point and partially filled with concrete or masonry, after which it is towed out and anchored in the correct position. Additional concrete is then added, causing it to sink and to come to a bearing on the prepared surface. To increase the bearing value of the foundation bed, piles are sometimes driven and the box caisson sunk on top of them, as illustrated by Fig 2. The bottom of the box is framed up of heavy timbers forming a sort of grillage and is often called a crib.

FIG 2 PILE AND CRIB FOUNDATION FOR A BRIDGE PIER

operation repeated until a suitable foundation bed is reached. Depths of 100 feet have frequently been thus obtained. This method is not applicable to running sand or to clay that is not solid enough to stand with vertical sides during the interval between making the excavation and placing the lagging. In some cases the excavation has been carried past a layer of quicksand by using a cylindrical shell of steel forced by jacks through this layer to an underlying one of firm material. But in general this method is dependent upon a continuous body of impervious material for its success.

Cofferdams for Subaqueous Work. These consist of substantially water-tight inclosures

Open Caissons, as the term suggests, are open both top and bottom. If a small amount of water is encountered, the excavation is made by men working inside the caisson, the water being removed by pumping or bailing. If water enters freely, the material is removed by dredging through openings, or shafts, extending up through the concrete or masonry with which the caisson is filled. The construction in either case is similar. The enclosing sides, or walls, are built of wood, steel, concrete, or masonry, and are generally started on a frame, which is protected by a steel member projecting below the frame and forming a cutting edge to penetrate the soil slightly in advance of the excavation.

FIG 3 PNEUMATIC CAISSON FOR FOUNDATION OF A BRIDGE PIER

The air lock shown is of old style. Note modern air lock in Fig 4

surrounding the required space to be occupied by the foundation. After pumping out the water and excavating to the required depth the masonry or concrete construction can be made in the open air. The construction of cofferdams varies with the existing conditions. The usual

A heavy platform, or roof, is built above the cutting edge, the space below the roof being called the working chamber. On this roof the concrete or masonry construction is started. An opening, or "shaft," is provided for the entrance and exit of the workmen and for the

passage of a hoisting bucket used for removing the excavated material. If dredging is used, there are a number of large openings through which the dredging is done, and the roof is often omitted altogether, the concrete or masonry filling being placed in pockets, or compartments, inside the caisson. In practice, the excavation is started before the concrete is carried up to its final height, after which the excavation and the building up of the pier progress simultaneously, the constantly increasing weight of the struc-

E, E, cutting edge, *W*, working, or air, chamber, *R, R*, reinforcing rods, *B*, excavation bucket, *S*, shaft, *L*, ladder in shaft, *P, P*, air pipes, *C, C*, concrete, *D*, cofferdam, *A*, air lock

ture aiding the sinking of the caisson. When the rock surface or other firm substratum is reached, the working chamber and shaft or the dredging wells are filled with concrete, making a complete pier from the foundation bed up to the required height. When dredging is used, the concrete filling of the dredging wells must generally be placed under water, though it is sometimes possible to pump out the caisson and place the concrete without the interference of the water.

Pneumatic Caissons The construction is similar to that of the open caisson, greater care, however, being used to make the working chamber, roof and shaft, or opening from the working chamber to above the surface, air-tight. On

top of the shaft is a device called an air lock, which prevents the escapement of the compressed air from the working chamber, but permits the passage of men and materials. It consists of an air-tight shell with a bottom and a top door. When the bottom door is shut, the top one can be opened, allowing passage between the lock and the open air. When the top door is shut, the bottom door can be opened, providing communication between the lock and the working chamber by means of the connecting shaft. In principle it works the same as the water lock of canals. The object of the compressed air is to prevent water entering the working chamber, enabling men to work in it as in a diving bell. (See Diving.) The pressure of the air evidently must vary with the depth of the cutting edge below water level. The men in the working chamber excavate the earth, which is hoisted in large buckets up through the shaft and through the lock, the caisson sinking as the excavation proceeds. In river work the material is often blown out through a discharge pipe by means of the compressed air. The caisson above the roof is usually filled with concrete, which not only makes the finished portion of the pier, but also gives the necessary weight to make the caisson sink, the concreting and excavating being carried on at the same time. Additional weight is sometimes required, in which case pig iron or layers of rails are placed on top of the concrete. When rock or other suitable firm material is reached, such material is cleaned and prepared by leveling or stepping its surface, and finally concrete is deposited and carried up so as to fill the air chamber with concrete packed tight against the roof, and then the shaft is also concreted. The maximum air pressure in which men can work for short periods is about 48 pounds per square inch above atmospheric pressure, corresponding to a depth below water level of about 111 feet. The physiological effects of compressed air are often serious, pains in the joints, damage to the ear drums, and the so-called caisson disease render work at high pressure extremely hazardous. The pneumatic caisson, however, is the only means (except the freezing process) of sinking piers through a great depth of water-bearing material in cities where the displacement of the soil caused by other methods would endanger the adjacent buildings.

The Freezing Process has been used in the United States only for one or two mining shafts, but in Germany it has been resorted to in making excavations for foundations of buildings. The method consists in driving steel pipes into the ground, which are closed at the bottom and are connected at the top by smaller pipes through which brine at an extremely low temperature is made to circulate. The refrigerating effect results in freezing the water contained in the soil, converting quicksand to a frozen mass resembling soft sandstone. The frozen ground acts as a cofferdam around the required area, and the material inside the frozen wall may then be excavated. This method has the advantage theoretically of being applicable to excavations of any depth, but many precautions are necessary, and at the present time it is only in the experimental stage.

Special Construction. Many of the large buildings in New York City have a number of cellars, or substories, below the ground water level, necessitating a water-tight structure around them. In such cases a dam, or retaining

wall, has been made by sinking rectangular pneumatic caissons to rock contiguously around the lines of the building, the caissons serving the double purpose of supporting the wall columns and of keeping out the water. Foundations for the interior columns are made, on the completion of the dam and of the excavation to the depth of the lowest floor, by excavating in sheet pile boxes or pits down to rock or hardpan. Sometimes, however, pneumatic caissons are also used for the interior column foundations, in which case the interior and the exterior caissons may be sunk at the same time. It is necessary to have some clearance between the ends of adjoining caissons to allow for deviations in sinking, the usual amount allowed being from 4 to 18 inches. These joints are made water-tight by filling them with clay or concrete.

The following figures give the principal dimensions and other data of important pneumatic-caisson bridge foundations

NAME OF STRUCTURE	Size, feet	Depth below water, feet	Material
Eads Bridge, St. Louis, Mo.	82 × 72½	109.7	Timber and iron
New York and Brooklyn Bridge	172 × 102	78	Timber
Forth Bridge, Scotland	70 diam	96	Iron
Havre de Grace, Md.	78 2 × 42 3	76	Timber
Alexander III Bridge, Paris	144 × 110	27	Steel
St. Louis Municipal Bridge	90 × 33	112	Timber
New Quebec Bridge	180 × 55	100	Timber

Among other deep excavations made by the pneumatic process may be mentioned the mine shaft near Deerwood, Minn., which was sunk to a depth of 123 feet below ground water level and is the greatest depth ever attained by this method. One of the caissons of the Municipal Building, New York, was sunk 112 feet below water level and is the deepest foundation for a building where compressed air was used.

The following list gives a few examples of foundations of high buildings in New York City:

NAME OF BUILDING	No of stories	Type of foundations
90 West Street	23	Wood piles
Park Row	26	Wood piles
Produce Exchange Bank	12	Concrete piles
St. Paul Building	25	Steel grillage
Woolworth	55*	Pneumatic caissons

NOTABLE EXAMPLES OF FOUNDATION WORK

In the preceding paragraphs the various methods of constructing foundations have been very briefly described. To illustrate the application of these methods in actual work, a few notable examples of foundation construction will be described.

Williamsburgh Bridge. The four suspension cables for this structure are carried by steel towers resting on masonry pedestals founded on pneumatic caissons. Each tower has two groups of four legs each, and each group of legs is carried by a separate pedestal and caisson

foundation. The caissons for the Brooklyn tower were built of timber and were sunk 97½ feet apart, centre to centre, and with their longer sides parallel. Each structure consisted of a pneumatic caisson and a cofferdam surmounting it, the whole forming a rectangular box 63 × 79 feet. The roof of the working chamber was 7½ feet above the cutting edge, and the space above it to the top of the caisson was filled with timber cribwork, with suitable wells left for exit from and entrance to the working chamber. The caisson for the south pier or pedestal was sunk to a depth of 107½ feet below water level. After sinking, the entire working chamber and all the open spaces in the caisson proper were filled with concrete. The stone masonry of the pier began on top of the caisson.

Poughkeepsie Bridge. The bridge across the Hudson River at Poughkeepsie, N. Y., was founded by first sinking open caissons, by dredging through interior wells, and then sinking box caissons on top of the open ones. The largest caisson sunk was 100 feet long, 60 feet wide at the bottom, 40 feet wide at the top, and 104 feet high. It was divided by one longitudinal and six transverse walls into 14 compartments. The outer walls and the longitudinal interior walls were made wedge-shaped and solid for a height of 20 feet, and above that they were hollow. The gravel used to sink the caisson was deposited in these hollow walls. The dredging was done through the 14 interior compartments, and when hard bottom was reached at a depth of 134 feet, the wells were filled with concrete deposited under water.

Hawkesbury Bridge. The foundations for this bridge, built over the Hawkesbury River, near Sydney, Australia, also were made with open caissons with dredging wells. The caissons were built of steel plates with longitudinal and cross braces and were oblong in plan with rounded ends, the length being 48 feet and the width 20 feet. There were three dredging wells, 8 feet in diameter, terminating at the bottom in bell-mouthed extensions, which met the cutting edge. The spaces, or pockets, between the wells and sides of the caisson were filled with concrete, and additional sections of steel added to the sides, as the caisson sank. When firm bottom was reached, the wells were also filled with concrete, and the pier masonry started on it at a depth slightly below water. These foundations are noted as being the deepest which have ever been sunk, the maximum depth attained being 162 feet below water. It is proposed, however, to sink the foundations of the new Sydney Harbor bridge to the depth of 170 feet below water.

Kingsbridge Power House. In constructing the power house for the Third Avenue Railway in New York City a pile foundation with a concrete platform was constructed, having lateral dimensions of 256½ × 319½ feet. At the site of the foundation a bed of fine sand overlaid solid rock at a depth of over 100 feet. A cofferdam of sheet piling was constructed entirely around the foundation. The bearing piles were driven 2 feet, 4 inches apart under the boiler house and 2 feet, 6 inches apart under the engine house. This spacing refers to the piles inside the first row around the entire building. The piles in this first row were driven close together and with a slight slant outward and downward. This arrangement was adopted to

aid the sheet piling in confining the sand. The inner bearing piles were all driven vertically by the water jet. The tops of the piles were cut off at a uniform level of 6 inches above the bottom of the excavation and were capped with a layer of concrete $7\frac{1}{2}$ feet thick or 7 feet thick above the tops of the piles. This concrete cap was a solid monolithic structure.

Auditorium Hotel. The Auditorium Hotel in Chicago rests on a platform foundation of timber 2 feet thick, covered with a layer of concrete 5 feet thick, in the concrete are embedded layers of railway rails and of I beams. The area of the foundation is 60,000 square feet.

The J P Morgan and Company Building. The foundations of this building, constructed in 1913, are a good illustration of modern methods of pneumatic caisson work. The building is on the southeast corner of Wall and Broad streets, New York City. At this site bedrock is of irregular formation, from 53 to 72 feet below the street, and ground water level is 15 feet below the curb. On top of the rock there is a layer of hardpan from 4 to 23 feet thick and above this quicksand extending to the surface. The plans provided for three substories, the lowest floor being $50\frac{1}{2}$ feet below the street, necessitating the water-tight dam construction. The lot is somewhat irregular in shape, with main dimensions 156×113 feet. It is adjoined on the south and on the east by the Mills Building, the foundations of which are spread footings resting on quicksand, and it was necessary to provide against their settling during the sinking of the adjacent caissons, as even the pneumatic method under such circumstances will cause some movement of quicksand. For this purpose 19 cast-iron cylinders, each made up of sections 4 feet long and 3 feet in diameter, were sunk to rock under the walls of these buildings at intervals of 10 to 15 feet. Niches were cut through the footings and up into the walls high enough to allow placing the first section of a cylinder. As the excavation inside the cylinder was made, the section was forced down by means of jacks. Another section was then placed on top of the first one and bolted to it, and the operation repeated till rock was reached. The cylinder was then filled with concrete, and the wall loads transferred to it by means of steel wedges. Compressed air was used during the sinking operation, each cylinder being in fact a small pneumatic caisson. The caissons forming the dam were 7 feet wide and from 16 to 29 feet long. They were made entirely of reinforced concrete except the cutting edge, which was of steel. At each end a semi-hexagonal opening was left in the concrete to subsequently form a key with the adjoining caisson. The caissons were sunk entirely around the lot, with intervening spaces of 18 inches between ends. After the caissons were sunk, these spaces were closed off by driving wooden sheet piling on the inside and on the outside line of the caissons, the sheet piling lapping the ends of the caissons by a few inches. The upper wooden forms of the caisson ends were then removed, making a hexagonal opening between caissons. A section of shafting was then concreted into this opening, and an air lock bolted to the top of the shaft. After applying air pressure the lower wooden forms of the caisson ends were taken out, the quicksand in the opening removed, and the opening entirely filled with concrete. On the completion of the dam the inclosed space was excavated down to

hardpan, or slightly below the lowest story floor line, and the foundations for the interior columns were made by open pits through the hardpan down to rock. As the excavation progressed, series of horizontal timber struts were placed extending across the lot in both directions, and wedged against the sides of the caissons to maintain the stability of the dam till the permanent floors were built. A good idea of the conduct of the work is shown in the illustration. A typical section view, in outline, of the caissons is given, and a picture of a modern air lock is shown in the accompanying plate.

Bibliography. The preceding paragraphs give only a bare outline of foundation construction, the great variety of methods and conditions of such work making a full treatment possible only in special treatises. Among the best books on foundation construction consult Patton, *A Practical Treatise on Foundations* (New York, 1893), Baker, *A Treatise on Masonry Construction* (2d ed., 1b, 1906), Fowler, *Practical Treatise on Sub-Aqueous Foundations* (3d ed., 1b, 1914), Jacoby and Davis, *Foundations of Bridges and Buildings* (1b, 1914), Kidder, *Architects' and Builders' Pocket-Book* (16th ed., 1b, 1914).

FOUNDER (from ME *founden*, to founder, from OF *fondier*, to sink, from *fond*, Lat *fundus*, bottom), or LAMINITIS. Inflammation of the vascular sensitive laminae of the horse's foot. It is rarely met with in cattle or sheep, owing to the corresponding structures being in them much less developed. Occasionally the laminae are strained from severe exertion, more frequently they suffer from the morbid effects of cold, which is especially injurious after the excitement and exhaustion of labor. Very commonly also they become inflamed from their close sympathy with diseases of the digestive organs, often following engorgement of the stomach, or inflammation of the bowels. All four feet are sometimes affected, more usually the fore pair only. The feet are hot and tender, the animal stands as much as possible upon the heels, trembles and groans when moved, and is in a state of acute fever and pain. Except when following superpurgation or internal disease, bleeding is useful. The shoes must at once be removed, and the toes, if long, reduced, but no further rasping or cutting is permissible. The affected feet should be kept in a tub of water at a temperature of 45° F or wrapped in cloths wet with cold water. Soap-and-water clysters, repeated if necessary every hour, usually suffice to open the bowels, which are very irritable. Physic, if required, must be used with extreme caution. Two drams of aloes is an ample dose in cases of founder. The strain should be taken off the inflamed laminae by getting the animal, if possible, to lie down, or, where this is impracticable, by suspending or supporting him in slings. When the inflammation continues so long that serum and lymph are poured out between the sensitive and horny laminae, free exit for the same must be provided by making an opening through the toe with a small drawing knife. This may prevent the pumiced and disfigured feet that are apt to follow severe and repeated attacks. After the acute symptoms pass, cold applications to the feet and a mild blister round the coronet help to restore the parts to their natural condition. Consult V. Shaw, *Encyclopedia of the Stable* (New York, 1913).

FOUNDER OF PEACE A title given to St Benedict

FOUNDERS AND PATRIOTS OF AMERICA, ORDER OF An hereditary patriotic society organized in New York City in 1896. The objects of the order are the association of those whose ancestors struggled together when the United States was a new country, the teaching of a reverent regard for the character of the founders of the country, and the preservation of records relating to the first colonists, their ancestors and descendants. It admits lineal descendants of an ancestor who settled in any of the Colonies prior to May 13, 1657, and whose subsequent ancestors were loyal to independence. The National Society consists of representatives of the State societies in New York, Pennsylvania, Connecticut, New Jersey, and Massachusetts, and holds annual meetings on the anniversary of the settlement of Jamestown. It has published valuable monographs on early Colonial history. The membership (1914) is about 500.

FOUNDING, or METAL CASTING The art of forming in loam or sand a mold of any given design which is subsequently filled with molten metal and the latter allowed to solidify. The resultant casting is a copy in metal of the design or model furnished. The place in which these operations are performed is called a foundry. Foundries are distinguished by either the metals employed or the class of castings made, as iron, malleable castings, steel, brass, statue, type, bell foundries, etc. The variations of working in founding are so numerous that it is possible here to describe even briefly only the general process of iron founding and a few more important special processes for producing certain kinds of castings.

Iron Founding may be divided into three operations (1) the making of the mold, (2) the melting of the metal, and (3) the pouring of the molten metal into the mold. The making of the design or model, which is usually called the pattern, is not strictly a part of founding, although in most instances foundries have pattern shops working in conjunction with them as a part of the same plant. Wood patterns are by far the most numerous, although the modern tendency is entirely towards metal patterns, iron, aluminum, or brass being preferred. The molding is usually done in sand or in loam, the great bulk of commercial iron castings being produced in sand molds. Every mold must consist of at least two parts in order that the pattern may be

FIG 1 SECTION OF FOUNDRY FLASK AND MOLD

removed. When the desired casting is of complicated form, the pattern is usually made in several pieces so joined that they may be removed one at a time. The process of molding in sand, using flasks, is, briefly stated, as follows. The lower flask, called the drag, is filled

with sand, and the lower half of the pattern embedded in it. The upper flask, called the cope, is then placed in position on the lower, and sand is rammed tightly around the upper half of the pattern. The pair of flasks is then turned bottom up, and the sand, first loosely placed in

FIG 2 SECTION OF MOLD ARRANGED FOR CASTING A STEAM-ENGINE CYLINDER

the drag, is removed and replaced by firmly packed fresh sand. The pair of flasks is then reversed to their original position, and they are parted along the line of juncture, the pattern remaining in the drag and the mold of its upper part remaining in the upper flask or cope. After removing the pattern from the drag and finishing up the imperfections in the mold by hand, the two flasks are again placed in position, and the metal is poured through suitably formed holes or gates. The mode of procedure just described is greatly varied in detail, but its essentials remain the same. For example, the bottom flask is often dispensed with, the lower half of the mold being formed or "bedded in" the sand floor of the foundry, while the upper half of the mold is formed in a flask, as when a pair of flasks are employed. Usually the pattern is parted at the middle, one part remaining in the drag and one in the cope to be separately removed. If the casting is to be hollow, a core of the proper form is suspended in the mold previous to restoring the cope to its position on the drag. These cores are commonly made of sharp sand mixed with linseed oil or flour and baked. Two varieties of sand molding are employed—green-sand molding and dry-sand molding. The essential difference is that in dry-sand molding the flasks, after the mold is finished, are placed in a drying oven and thoroughly dried. Molds in dry sand admit of exceedingly large and intricate castings being made with much less risk than in green sand.

Loam molding, which is gradually being replaced by dry-sand molding as our foundries are being better arranged for drying molds on a large scale, differs from sand molding in that the molds proper are not contained in flasks or bedded in the floor, but are constructed in sections composed of rings, plates, and brickwork. To illustrate loam molding the comparatively simple process of casting a cylinder will be described. A hollow core of iron or brick is first erected and plastered outside with a layer of loam—mixed sand and clay—to the exact inside dimensions of the cylinder. When the loam

coating is dried, it is washed with a mixture of charcoal and water. A layer of loam is then added which is laid on and finished off to the exact thickness and exterior form of the cylinder to be cast. This is then dried and washed, as was the core. Around this thickening, as it is sometimes called, is built a shell of brickwork a few inches larger than the thickened core, and the annular space is rammed full of loam. When dried, this shell is lifted by a crane and the thickening removed from the core. The shell or cope is then replaced, and there is an annular space left between it and the core, exactly the dimensions and shape of the thickening. This space is the mold into which the molten metal is poured. This is almost exactly the process of bell casting. See BELL.

The iron is melted in a cupola, or foundry furnace, which consists essentially of a short iron cylinder mounted on iron columns and lined with fire brick, and of a belt or wind box surrounding the cupola near the bottom, from which several pipes or nozzles, called tuyeres, extend into the cupola to give entrance to the air blast. Cupolas vary in diameter from 2 to 10 feet. They are cylindrical for a portion of their height, and then conical, to form a chimney. At the top of the cylindrical portion is placed the charging hole, and at the bottom are one or two breast holes for raking out the cinders, and a tap hole through which the molten metal is drawn. The molten metal is run into ladles, which are iron vessels lined with some refractory substance, and provided with a lip for directing the metal into the mold in pouring.

The preceding paragraphs describe very briefly the general process of making iron castings, the following are the special methods adopted in making certain forms of castings which are used in large quantities, such as car wheels, cast-iron water pipe, kettles, ordnance, and statuary. The casting of car wheels varies from the general process described only in having an iron ring for that portion of the mold which forms the thread. This iron ring has the effect of suddenly cooling the metal forming the thread and thus rendering it more dense and hard. This hardening process is called chilling and is employed in making rolls and other articles which require a hard wearing surface. Water pipe is cast vertically in cast-iron casings having the core on a barrel. The pattern is inserted in the casing, and the annular space between it and the casing is rammed full of sand. The pattern is then removed and the core inserted in its place. In casting kettles the core corresponding to the inside of the kettle is molded bottom up on a bare plate. A thickening of sand of the exact thickness and exterior form of the kettle is then added to the core. A cope is then built around the thickened core and when dry is removed to allow the thickening to be broken away, after which it is replaced and the metal poured. All cast-iron hollow ware, pots, pans, etc., are cast in substantially the same manner.

Statue founding is much similar, except that the thickening of the pattern in bronze casting is made of wax, which is melted out by heat without lifting the cope. Small statuary casts of lead, tin, zinc, and their alloys are made by pouring the metal into iron molds and, after due time has been allowed for a skin to congeal on the surface, inverting the mold and allowing the molten inside metal to run out. Iron statues

are founded like kettles or bells, with a core thickening of sand or loam and with the cope made in sections to permit removal. Type is cast in metal molds at the ends of which is the matrix for forming the letter. In modern type foundries the process is a mechanical one, performed automatically by type-casting machines.

Cast ordnance is now seldom made, but the process of producing such castings calls for a brief explanation. Bronze and cast-iron cannon are cast in loam molds. The founding of a Rodman gun, which, while now long obsolete, was the most recent form of cast gun, is as follows. The mold is of dry sand contained in circular sectional casings. The chief feature is the core barrel, which consists of a water-tight cast pipe or barrel with flutes on its exterior surface along its whole length to permit the gas to escape upward from behind the hemp and loam with which the barrel is coated. After the mold has been closed together, the barrel is attached to a spider or tripod, the legs of which rest upon the top flange of the casing, adjusting screws at the end of each leg permit the accurate centering of the core in the mold. A pipe extends down the centre of the core, through which water is forced and escapes by rising through the annular space between the pipe and the inside of the core. The purpose of this process is to cool the gun casting from the inside outward. In casting a 15-inch gun the water pipe and core are removed in about 24 hours, and afterward a current of cool air is forced into the bore of the gun, which is cool enough to remove from the mold in about 9 or 10 days. The water-cooling method described here is very useful in making complicated steam-engine frames and cylinders as well as steam turbines.

Molding machines are made in a great variety. One of the most important classes comprises machines for molding cast gear wheels. The latest achievement is the development of the "jarring" molding machine, in which flask, sand and pattern are "bumped" on a solid anvil by compressed air. The result is that the sand is packed about the pattern much faster and better than by hand, and an enormous saving is effected in labor and time. Castings 8 to 12 tons in weight are now made this way. The molding machine is gradually replacing manual labor for all repetition work, as it is cheaper and better than hand work. Even such intricate castings as automobile cylinders are now made by specially designed molding machines.

FOUNDLING HOSPITAL, or **ASYLUM**. An institution for the care of children, particularly infants that have been abandoned by their parents or guardians. In modern times the great majority of children in foundling hospitals are not foundlings, but are (1) illegitimate children

brought to the institution by the mothers or their friends, (2) legitimate children whose mothers, because of desertion of husband, poverty, or other causes, feel unable to care for them, and (3) a few orphans

The first foundling hospitals were introduced by the Church to prevent infanticide. In the sixth century the Bishop of Treves permitted children to be placed in a marble basin before the cathedral, with the understanding that members of the Church would care for them. The capitularies of the Frankish kings mention foundling hospitals. The first well-authenticated establishment was founded at Milan in 787 A.D., the Council of Nicaea in that year having ordered that each city should have an institution for abandoned children. A foundling hospital was organized at Montpellier in 1070, Einbeck, 1200, Rome, 1212, Florence, 1317, Nuremberg, 1331, Paris, 1362, Vienna, 1380. For the care of children above the age of infancy, see DEPENDENT CHILDREN

The number of foundling hospitals in France was greatly increased through the labors of St. Vincent de Paul and of Colbert in the seventeenth century. After 1789 the French Republic assumed the charge of foundlings. The children were at first publicly received, but by a decree of 1811 there was introduced into foundling hospitals throughout the Empire a revolving cradle "tour," so arranged that the person who deposited a child in the cradle could not be seen from within. The person was then able to turn the cradle so that the child would be brought within the institution. This was introduced on the ground that thereby child murder would be lessened. Whether infanticide was materially decreased is not known, but the unexpected and immediate effect was a great increase in the number of children abandoned. The number left at foundling hospitals in 1784 is stated to have been 40,000, in 1815, 68,000, and in 1834, 134,000. Other countries had similar experiences. In 1834 a parliamentary commission reported that the influence of the tour was pernicious, and it was gradually abolished. With the abolition of the tour a marked decline in the number of foundlings took place.

At present the public foundling hospital in France serves merely for the temporary care of the infants. Every attempt is made to discover the identity of the mother. If found, persuasion is employed to induce her to take back the child, if she is in need of support, public aid is promised her. When the mother cannot be found, or if she will not take the child back, a place is found for it in a private family, where it is nursed and cared for during the period of infancy. A similar system is in vogue in some of the German cities, notably Leipzig. This system has not only greatly diminished infant mortality, but has very materially diminished the number of children abandoned.

In Vienna foundlings are cared for in a hospital. Mothers who wish to leave children in the institution are required to serve in the hospital as nurses for a period of three months. The system provides for the nursing of children whose mothers are not found. Moreover, after caring for her child for so long a period of time, the mother is less inclined to leave it if it is possible for her to keep it. The system has been found to yield very satisfactory results.

About 1741 the Foundling Hospital of London began to receive children. It was established by

Thomas Coram, a benevolent sailor, who donated 56 acres of land, which now yield in annual rents more than the original purchase price of £5500. At first applications for admission were so numerous that the children admitted had to be chosen by lot. Fifteen years later Parliament gave financial assistance, and all the children deposited in a basket outside the gate were cared for. This system led to such serious abuses that the authorities decided to take charge of only those children who were accompanied by the sum of £100. In 1801 the present form of organization was adopted. A child is admitted only after a careful personal examination of the mother has shown that it is illegitimate and the first born, and that the mother has never lived with the father. Preference is given in cases where the mother has been deceived by a promise of marriage. The hospital is rich and well managed and takes good care of its foundlings.

In America the county poor farm was the only place at first provided for foundlings. In some places there is still no other public provision. Foundling hospitals, however, are now to be found in all the larger cities. Nearly, if not all, the foundling hospitals are under private management, but many of them receive subsidies from public funds. "Baby farms" is the name applied to those places where babies are boarded for the sake of the gain. In most cities there is no inspection of such establishments, in spite of the fact that the system is known to give rise to frightful abuses.

The death rate in foundling hospitals frequently ranges from 90 per cent to 100 per cent, and an average of 75 per cent is common. The experience of European institutions is identical. The better institutions now recognize this evil and seek to avoid it by having the mother who wishes to leave a child in the institution stay and nurse it and another child also if possible. In the Chicago Foundlings' Home, where this rule is practically enforced, the death rate is very low. Where this plan is impracticable, the New York Foundling Asylum and others have adopted the plan of placing the infants at board in selected private families. Those receiving the children must comply with the detailed rules of the institution. Medical care is furnished, and a careful system of visitation is maintained. The children are later recalled to the institution and are finally placed in homes.

Another objection to the present system is that the preliminary investigations are insufficient, so that many children are received who are not properly subjects for charity. Very few foundling hospitals make any further investigation than to question the one bringing the child.

In Massachusetts foundling hospitals have been abolished by law. It is forbidden to board more than two infants under two years of age in any family unless that family has a license given after thorough investigation, the license stating the number of children allowed. The State Board of Charities has a department for the children, who are boarded out in families.

FOUNDRY See FOUNDING

FOUNTAIN (OF *fontaine*, *fontaine*, Fr *fontaine*, from ML *fontana*, from Lat *fons*, spring, connected with Gk *χεῖρ*, *chēin*, Skt *hu*, to pour, AS *gēotan*, Icel *gjeta*, OHG *gīozan*, Ger *giessen*, to pour) A natural or artificial spring or source from which water gushes, spouts, or falls into a basin or series of basins. When water is led from a reservoir through a pipe to an orifice suitably placed at a lower level, it will spout upward to a height a little less than that of the level in the reservoir. This is the principle applied in most jet fountains, as in the famous "Grandes Eaux" at Versailles, fed from reservoirs at Marly. Where a suitably elevated source is not available, the necessary hydraulic pressure for producing jets is obtained by means of force pumps. In southern and eastern countries where water is not abundant, both natural and artificial sources of supply have in all ages been treated with special care and often adorned with artistic elegance. In the ancient world religious devotion to the deities of water, especially of curative mineral springs, was an added incentive to such treatment. The earliest preserved examples are a large stone basin carved in relief with figures, found in the royal palace at Tello (3000 B.C.), and an Assyrian fountain at Vavian, sculptured in the face of the rock itself, where two affronted lions rest their forepaws on the mouth of a vase from which the water spouts into a series of basins cut in the rock.

The ancient Greeks made little display of the flow of water, but gathered it into basins over which were erected pavilions or colonnaded porticoes. The Greek vases also show a type of small open fountains with water spouting from the mouths of lions or boars set in the upper part of a central column through which the water supply was carried. The city of Corinth was rich in fountains. That of Pirene, mentioned by Herodotus and excavated by the American Classical School of Athens under Richardson, contained a number of cells from which the water flowed into an open basin. In another fountain the water flowed from the hoofs of the horse Pegasus. The Fountain of Glaucus, inclosed in the Odeum, was dedicated to Glaucus because she was said to have thrown herself therein, believing that its waters would counteract the poisons of Medea. Another Corinthian fountain had a bronze statue of Neptune standing on a dolphin from which the water flowed.

Among fountains famous for their architectural treatment were those of Megara and Lerna. Mystical qualities, as well as supernatural origins, were ascribed to fountains, and they were often connected with temples and shrines. Salt springs were sacred to Poseidon, many curative springs to Æsculapius and Hygieia. The famous Enneacrunos Fountain at Athens was called Callirrhoe before the time the water was drawn from it by the nine spouts from which it took its later name. The fountain in the Temple of Erechtheus at Athens was supplied by a spring of salt water, and a similar spring supplied that in the Temple of Poseidon Hippias

at Mantinea. Above the Heraeum of Argos, the centre of Argive worship, was the famous Asterion Fountain. Often the Greeks made rock excavations to capture the water at its source. Among the most notable of these were that near Syllum in Pamphylia, which still remains, that near Larnaca in Cyprus, and the Burinna Fountain near Cos, covered with a dome. Among the famous fountains consecrated to Apollo were the Castalian Fountain and the Casotis at Delphi, connected with the oracle, vapor and gas in the water contributed to the cult. The importance attached by the Romans to an abundant and hygienic water supply is attested by the grand scale of their hydraulic engineering and by the ruined aqueducts (qv) which cross the Campagna. These supplied the baths and the public fountains, which were of large size and numerous. When Agrippa reorganized under Augustus the city's water supply, he made or restored 700 fountains, decorating 400 with marble columns and 300 with statues of marble or bronze. The two chief types of Roman fountains were the *niche* fountain, set in a wall, with spouts, often representing heads, shells, or dolphins, discharging into a basin, and the *open* fountains, set in open spaces, with jets or spouts above one or more circular basins. No Roman fountains exist today even approximately intact, but fragments of their sculptured decorations have survived, e.g., a marble *thyton* in the Palazzo dei Conservatori at Rome, and figures of Tritons, river gods, etc. Pompeian wall paintings have also preserved for us pictures of various garden fountains of the second type. They were an important element in both the economy and decoration of Roman villas and country houses. Not the least interesting of the Pompeian discoveries are the public and private fountains of that provincial town. The public fountains were comparatively simple, with little or no ornament except a carved head serving as a spout, but the private fountains display considerable variety, both of form and decoration. The most beautiful are the *niche* fountains wholly incrustured with brilliant mosaic of colored glass and shells. Especially interesting are those of the Casa della grande fontana and the Casa della piccola fontana a mosaico, and those of the Casa del Centenario and of the Casa di Lucio. In 1880-81 a particularly beautiful one was found, decorated with a statuette of Silenus and with mosaics of the Birth of Venus and the Bath of Venus and the Loves. Not only did simple running fountains exist, but the remains of jet fountains have been found, and a drawing exists representing a vase with a double jet of water, standing on a pedestal placed in what is supposed to have been the impluvium of a house. Public fountains were a feature of every Roman city, and interesting examples have been found in Algiers, as at Thamugadi (Timgad) and Cuiculi (Jaula). The Romans were from the earliest times quite as devoted as the Greeks to the cult of sacred springs and to their deities, such as Juturna, Pious, and the nymph Egeria, whom legend made the inspirer of King Numa. The discoveries of votive offerings at mineral and other springs show the cults to have been continuous from the Royal to the Imperial period.

As among the Greeks and Romans, so with the early Celts and other northern tribes, traces of superstitious beliefs and usages with relation

to fountains can be traced in monumental and legendary remains. Miraculous virtues are still attributed to certain ancient fountains in Brittany, to which the country people repair with offerings. The Christian missionaries, finding themselves unable to eradicate the superstitions which ascribed miraculous power to rocks and woods, streams and fountains, connected with the divinities of the old religions, changed their form and direction by dedicating these objects to the Virgin and saints, so making the force of the old belief an instrument for its own overthrow. Fountains were attached to the new religion by the erection of statues of the Virgin or of saints upon the possibly rude structures that collected the water and preserved its purity. There is some uniformity in the architectural characteristics of these structures during the Middle Ages. A very common form in rural districts was that in which a large basin, reached by descending steps, received the water. This basin was covered by a vaulted shelter, often adorned with molded arches and sculptured figures and escutcheons. The fourteenth-century Fontaine Joubert at Portiers (restored 1597) was such a fountain, with a niche, bench, and sunken basin. Many such fountains are found in Brittany, and elsewhere throughout France. A form more common in populous districts was that of a large open basin, round, square, polygonal, or lobed in form, with a columnar structure at the centre, from the lower part of which it was arranged that spouts should issue, playing into an open basin and supplying vessels brought for the purpose in the cleanest and quickest manner. To this general type belong the univalet group of mediæval fountains at Viterbo (Italy), in which the central shaft, bearing lion's-head spouts, usually rises from the lower basin and carries a second, much smaller basin on its capital, with a smaller and shorter central shaft supporting a third basin crowned by a pinnacle. In the Gatteschi Fountain the two upper basins are quadrilobed, and the lower one is cruciform. They are always raised on a stepped platform and stand in the centre of squares.

In some of the later Gothic fountains the central column is replaced by an elaborate Gothic structure like a spire. At Rouen the Pucelle Fountain (fifteenth century) has an elaborately sculptured pinnacle. The most exquisite of all Gothic fountains is in Germany, the Schöne Brunnen at Nuremberg, a high polygonal structure like a cathedral tower, a mass of tracery and sculpture (fourteenth century). In the public market place at Brunswick is a fountain of the fifteenth century, of which the central structure is made of bronze. Except in Italy, few fountains are of earlier date than the fourteenth century. The Italian fountains of the Gothic period are, however, numerous and beautiful, some even belong to the late Romanesque age. The most monumental of these are, perhaps, three situated at Siena: the Fonte Branda, which has been celebrated by Dante, built in the twelfth century, the Fonte Nuova, built in 1259; and the Fonte Gaja, constructed in 1419. This Sienese type was a large rectangular basin, with a solid wall on three sides. At the Fonte Branda the covering brick structure is 30 feet high, with three groined vaults, battlements, corbels, and blind arches were its main decorations, but terra-cotta ornamentation is used already in the Fonte Nuova,

while pilasters, with bas-reliefs and statues in niches by Giacopo della Quercia and other famous sculptors, decorated the Fonte Gaja, one of the most beautiful in Italy. Of equal beauty is the Fontana Maggiore at Perugia, one of the finest works of Niccolò di Arezzo and Giovanni Pisano (c. 1300). It is a 24-sided polygon, four concentric steps lead up to a lower basin, 30 feet in diameter, each face decorated with fine reliefs, separated by grouped colonnettes, from the water of this basin rise 24 columns supporting the upper polygonal basin, whose angles are marked by statuettes. In the centre of this basin is a heavy bronze column supporting a bronze basin upon which a group of three water nymphs now stands.

During the Renaissance the designing of fountains became an important and almost a distinct branch of art, combining in one design the resources of architecture, sculpture, and landscape decoration. Fountains were no longer confined to public squares and purposes of utility, but took their place also in the elaborate decorations of the gardens and parks of the villas or palaces of the great and wealthy. This development began in the villas erected during the middle and late Renaissance in Italy, was carried into France, where in the seventeenth century it culminated in the grandiose water effects of Saint-Cloud and Versailles, and spread into Germany and the rest of Europe. England has in general neglected this branch of decorative art, and its chief centres outside of Italy have been in France and in the capitals of the various states of Germany.

In the Italian villas of the sixteenth and seventeenth centuries water became an essential element of the garden designs, always in connection with a monumental treatment of architectural or sculptural accompaniments, to which the leading artists of the time often devoted their talents. Two types chiefly prevailed—the cascade, in which a moderate volume of water was made to produce a maximum of effect by falling in thin but brilliant sheets over multiplied obstructions—steps, basins, rocks, etc.—always in a framework of architecture with abundance of sculptured accessories, and the isolated or central fountain, in which one or many jets spouting upward fell into the highest of a series of superposed *vasques*, or bowls of marble or bronze, and thence into a larger one below, and so on into a broad basin on the ground level. Of the former type, the most extensive example is the series of cataracts in the Caserta Palace gardens near Naples, by Vanvitelli (1753), but notable examples of equal or higher artistic merit are those of the Villa Lante, near Viterbo (Vignola, 1540–50), of the Villa d'Este at Tivoli (Fontana, 1580–?), and of the villas Torlonia-Conti, Aldobrandini, and Mondragone at Frascati.

The superposed-basin type is seen in numerous admirable examples, not only in the villas, but in the public squares of many towns. Among them may be mentioned the beautiful Farnese fountain in the Lante Villa, near Viterbo, the elaborate fountain in the Piazza Pretoria at Palermo (1550), by Florentine artists, the late and highly rococo Fontana Medina at Naples, the Neptune Fountain, by Gian Bologna, at Bologna; the Neptune Fountain, by Ammanati, at Florence, the fountain in the Piazza Madonna at Loreto, others at Fano, Viterbo (Piazza della Rocca), the Boboli Gar-

dens at Florence, etc. At Rome most of the fountains of this type are of late date—e.g., that about the obelisk of the Quirinal, the great basin fountain of the Villa Albani, the Tortoise Fountain in the Piazza Mattei, that in the Piazza Navona, etc. At Rome also are three examples of another type, in which a structure like a triumphal arch pours forth one or more cataracts into a large basin, with or without sculpture, the Acqua Felice in the Piazza dei Termini (sixteenth century), the Fontana Paolina (1612), and the Fontana Trevi, the most spectacular of its type and grandly composed, even if in doubtful taste (N. Salvi, 1762). This type, treated as a wall fountain, is the prototype of several fine fountains in Paris, of which the modern Fontaine Saint Michel, by Davioud, is the most ornate.

Among the earliest Renaissance fountains in France is that of Clermont-Ferrand, an elaborate and beautiful architectural design forming a species of lofty canopy in the centre of a large basin (early sixteenth century). Jean Goujon carved the sculptures for the Fontaine des Innocents, designed by Lesnot, in Paris (1550, re-erected in recent times on an altered plan), whose nymphs are famous. He also made the Diana for the fountain at the Château d'Anet. The magnificent basins, jets, and other water works at Versailles belong to a later date. The French have developed the cascade type into a greater variety of forms than is found in Italy and have handled these with great taste, not only in such "châteaux-d'eau" as that of Saint-Cloud, but in many recent examples in which sculpture plays an important part (Fontaine Sainte-Marie, at Rouen, Fontaine Longchamps, at Marseilles). The central shafted type has also been developed by modern French artists in a number of beautiful examples, such as the twin fountains by Hitorff in the Place de la Concorde, at Paris, the Louvois Fountain, by Visconti (1835), and the Fontaine des Saisons, by Carpeaux, in the Observatory Gardens, in the same city. The Fontaine Saint-Sulpice, by Visconti, is a cold but effective design. The Birague, Grenelle (by Bouchardon), Molière, and Cuvier fountains, in Paris, should also be mentioned. The fountains at Bern, Switzerland, and the Alameda Fountain at Malaga, Spain, are good examples of the simpler type, with statues on central shafts. There are a number of interesting fountains in Belgium, while at Vienna the Neuer Marktbrunnen (1739), the Hochstrahlbrunnen in the Schwarzenberg Palace gardens, and the Albert Fountain, deserve at least passing mention. The highest artificial jet fountain is that of the palace of Herrenhausen, Hanover, which is over 200 feet high. But no other European country can compare with France and Italy in the number and beauty of its fountains, considered as works of art.

In the Orient the Greek tradition of covered fountains was continued by the Mohammedan artists, though the Moors in Spain often adopted open basins, as in the Fountain of the Lions in the Alhambra. Each city in the East was provided with many fountains, inclosed and usually covered in like the tombs, with one or more domes, and a fountain for ablutions has always been an essential requirement in every mosque court. The Koran extols the erection of a public drinking fountain as a specially meritorious form of charity. Cairo, Constantinople, Adrianople, and Damascus are especially rich in them, there

being 300 in Cairo alone. They are circular, polygonal, or rectangular, and ornamented with brilliant tiles, niches, columns, carving, inlay, and gilding, but have no display of water even within, for it falls into very small basins from a concealed central supply. The finest of the Turkish fountains is the large and highly ornate Fountain of Achmet III, near the Mosque of St. Sophia, another almost equally important is in Scutari, a suburb of Constantinople.

Artificial fountains are not abundant in American cities, yet there are some in the parks and squares of Cincinnati (the Probasco Fountain), New York (Central Park, City Hall Park, Bronx Park, etc.), and other places that are occasionally in action. The earliest decorative fountain in the United States appears to have been set up in Philadelphia about 1829, with a wooden figure carved by a ship carver, but of real artistic merit. Decorative fountains have played an important part in the design of recent exhibitions in the United States, notably the Fountain of the Republic, by Macmonnies, at Chicago in 1893, and the fountains of Man, Nature, Progress, etc., in the Pan-American Exposition grounds at Buffalo in 1901, the fine cascade fountain of the Louisiana Purchase Exposition (St. Louis, 1904), etc. Following Italian precedents, American landscape artists and owners of fine estates are to an increasing degree using fountains as garden decorations, and women sculptors have been especially successful in this branch of art. Within recent years both memorial fountains and drinking fountains have been put up more liberally in the United States, especially by private individuals, and are often artistically designed and decorated.

Consult Boussard, *Choux de fontaines decoratives* (Paris, 1883), Duval-Moisny, *Les fontaines de Paris, anciennes et nouvelles* (ib., 1828), Falda, *Le Fontane di Roma e luoghi pubblici della città* (Rome, 1691), "Minor Fountains," in *American Architect* (Boston, 1898').

FOUNTAIN OF AR'ETHU'SA See ALPHIEUS

FOUNTAIN OF CASTALIA See CASTALIA

FOUNTAIN OF VAUCLUSE, vó'klúz'

See VAUCLUSE

FOUNTAIN OF YOUTH A miraculous fountain having the property of restoring youth and healing sickness. Such fountains are a part of the mythology of many lands. In the Middle Ages a fountain of youth was supposed to exist in an island or region called Bimini and was sought by Ponce de León, De Soto, and other Spanish explorers.

FOUNTAIN PEN See PEN

FOUNTAINS ABBEY An extensive Cistercian monastery, 3 miles from Ripon, England, dating from the thirteenth century and standing on the demesne of Studley Royal, the property of the Marquis of Ripon. The picturesque ruins represent only a portion of the abbey. The Norman-English church is in good preservation, and the remains of the refectory, chapter house, and great cloister are still extant. Consult Hodges, *Fountains Abbey* (New York, 1904), and Oxford, *The Ruins of Fountains Abbey* (London, 1910).

FOUQUÉ, fō'kă', FERDINAND ANDRÉ (1828-1904) A French geologist, born at Mortain and educated at the Normal School at Paris, where from 1853 to 1858 he was curator of the scientific museum. After holding positions in

several educational institutions and taking part in a large number of scientific expeditions, he became known particularly for his investigations of volcanoes, and in 1877 was made professor of geology in the Collège de France. His researches into the constitution and origin of the igneous rocks and into the optical properties of minerals helped to establish the modern science of petrology upon a firm basis. In these investigations he frequently cooperated with Michel Lévy. He was elected to the Academy of Sciences in 1881. He published a large number of scientific works, among the most important of which are *Introduction à l'étude des roches éruptives françaises* (1879), *Santorin et ses éruptions* (1879), *Synthese des minéraux et des roches* (1882).

FOUQUÉ, FRIEDRICH HEINRICH KARL, BARON DE LA MOTTE See LA MOTTE FOUQUÉ

FOUQUET, fōō'kă', or FOUQUET, JEHAN (c 1420-c 80) A French portrait and miniature painter and illuminator, the most representative of the fifteenth century. He was born in Tours, and studied there and probably in Paris and Italy. His art, while thoroughly individual and national, was undoubtedly formed under the influence of the Flemish school of the Van Eycks and under that of the early Florentine masters, especially Fra Angelico, assimilating the finest qualities of both. In his miniatures he probably followed Pol de Limbourg. He was in Italy about 1443-47 and painted the portrait of Pope Eugenius IV, long preserved in Santa Maria Sopra Minerva, Rome, but now lost. On his return to France he was appointed court painter to Charles VII and later to Louis XI and became the head of a flourishing school. Fouquet was appreciated only as a miniature painter until recent historians recognized his value, artistically and historically, as the founder of the French school, and the exhibition of the French Primitives at Paris in 1904 revealed his excellence as a painter. His only authentic paintings are the portraits of Charles VII and Juvenal des Ursins in the Louvre, to which the latest critics are inclined to add the portrait of a "Man with a Glass of Wine," also in the Louvre, a portrait of a man, in the Liechtenstein Gallery, and one in the collection of Count Wilczek in Vienna, two wings of a diptych—one representing Agnes Sorrel as the Virgin, in the Antwerp Museum, and the other a kneeling figure of Etienne Chevalier, in the Berlin Museum. His most celebrated illuminations are a series of miniatures for a French paraphrase of Boccaccio (1458), in the Munich Library, the *Book of Hours* of Etienne Chevalier, 40 pages of which were bought by the Duc d'Aumale for the Chantilly collection, for 300,000 francs, two volumes of illustrations for Josephus' *History of the Jews* (National Library, Paris), perhaps his best work, and *Les grandes chroniques de France*, also in the Bibliothèque Nationale. His drawing is vigorous, the expression of his faces lively, and his color clear and glowing, his realism restrained, and his observation keen, with a fine sense of humor. Consult *Œuvres de Jehan Fouquet* (Paris, 1866-67), "Facsimiles of two Histories by Jean Fouquet," from vols 1 and 11 of *Anciennetés des Juifs* (London, 1902), Lafenestre, *Jehan Fouquet* (Paris, 1905), Richter, *Chantilly in History and Art* (London, 1913).

FOUQUET, NICOLAS, VICOMTE DE MELUN and DE VAUX, MARQUIS DE BELLE-ÎLE (1615-80)

Superintendent of Finance under Louis XIV. He was born in Paris, Jan 27, 1615, the son of a French nobleman high in the confidence of Richelieu. Young Fouquet was educated for the civil service and from 1642 to 1647 was attached as intendant to the Army of the North. He was then made Commissioner of Police, Justice, and Finance in Dauphiné and held other important offices until, in 1648, he was called to Paris as intendant for the municipality and became involved in the political intrigues of the day. In 1650, through the influence of Mazarin, Fouquet was given the important post of Procureur-Général to the Parlement of Paris. His attitude during the Fronde (qv) had won him the regard of the court, and of Anne of Austria in particular, and in 1653 he was made Superintendent of Finance with a colleague, Servien, for his faithfulness to Mazarin. His colleague died in 1659, leaving Fouquet alone in office. As chief Financial Minister, Fouquet set himself to work to reorganize the finances of France. Corruption and maladministration, together with heavy war expenses, had drained the treasury, and it is stated that the new Minister had at first to meet expenses by negotiating loans on his own credit. Mazarin soon became jealous of his protégé's influence, and after the Peace of the Pyrenees (1659) and the marriage of the King, an open breach took place in their relations, and henceforth each sought to overthrow the other. In his anxiety to be supreme, Fouquet overdid his part, and on the death of Mazarin, Colbert (qv) was consulted regarding the state of the finances and secretly influenced the King against Fouquet by putting the financial situation in the worst possible light. Meanwhile Fouquet had secured possession of the port of Belle-Île and had fortified it as a place of refuge. He also erected a magnificent château on his estate at Vaux, and there, in August, 1661, he entertained the King with a magnificence and splendor hardly surpassed later at Versailles. Louis XIV would not be conciliated, however, and Fouquet would have been arrested in the midst of the festivities, but for the prayers and intercession of the Queen-mother, Anne of Austria, who was still his friend. There can be little doubt that the charges of maladministration and dishonesty brought by Colbert against Fouquet were substantially true, for the latter was forced to resort to speculation in order to keep up the almost royal state in which he lived. In an age, however, when every one connected with the royal treasury stole, it was Fouquet's only misfortune to be caught. He had been craftily persuaded to sell his office of Procureur-Général and so deprive himself of the privileges that went with the office. He was arrested at Nantes, in September, 1661, charged with malfeasance in office and with planning rebellion. His papers were seized and examined. After being moved from prison to prison, he was consigned to the Bastille, and in 1664 was adjudged guilty, after a very unfair trial lasting over three years, and was condemned to perpetual banishment, with confiscation of goods and property. This sentence the King changed to imprisonment for life, and Fouquet was sent to the fortress of Pignerol at the beginning of 1665. During his 15 years' captivity he composed several works of a devotional nature. He died at Pignerol, March 23, 1680. During the height of his power Fouquet was a generous patron of art and literature.

and was intimate with all the literary men of the day. He presented to the Bibliothèque Royale (now Nationale) 13,000 rare volumes which he had collected. He had, however, neither the breadth nor the statesmanship of his contemporary, Colbert. Consult Holland, *Ouvrages de M. Fouquet* (Paris, 1696), Cheruel, *Mémoires sur la vie publique et privée de Fouquet* (ib., 1862), Lair, *Nicolas Fouquet* (ib., 1890), Hassall, *Louis XIV and the Zenith of the French Monarchy*, in the "Heroes of the Nations Series" (London, 1885), Chatelain, *Le surintendant Nicolas Fouquet* (Paris, 1905).

FOQUIER, fō'kyā', JACQUES FRANÇOIS HENRY (1838-1901). A French publicist, born in Marseilles. He studied law and medicine, pursued a course in art at the Institute in Geneva. In 1861 entered journalism in Paris, and in 1867 was a war correspondent with Garibaldi in Italy. He held various administrative positions in the Department of the Interior and after being defeated in 1885 and 1888 was elected, in 1889, a member of the National Assembly. He was connected editorially with *La Vraie République*, *Le Petit Parisien*, and *Gil Blas*, and in 1891 became the dramatic critic of *Le Figaro*. His publications include *Études artistiques* (1859), *L'Art officiel et la liberté* (1861), *Au siècle dernier* (1884), *La sagesse parisienne* (1885), and a play (1890) with Fabrice Carrié, adapted from Ranc's *Le roman d'une conspiration*.

FOQUIÈRES, fō'kyār', (LOUIS) BECQ DE (1831-1887). A Frenchman of letters who began life as a soldier and became an officer, but resigned from the army in 1858 to devote himself to literature. He is best known as the incomparable editor of André Chénier's works, and is remembered also for his editions of the selected poems of Balaï and of the works of François de Pange. From him came also, *Drames et Poésies* (1860), *Jeux des anciens, leur description, leur origine, leurs rapports avec la religion, l'histoire, et les arts et les mœurs* (1869), *Aspasie de Milet* (1872), *Documents nouveaux sur André Chénier et examen critique de la nouvelle édition de ses œuvres, accompagnés d'appendices* (1875), *Œuvres choisies des poètes du XVIIe siècle* (1879), *Traité général de versification française* (1879), *Lettres critiques sur la vie, les œuvres, et les manuscrits d'André Chénier* (1881), *Traité de diction et de lecture à haute voix* (1881), *Traité élémentaire de la prosodie française* (1881); *L'Art de la mise en scène* (1884).

FOQUIER-TINVILLE, tăn'vel', ANTOINE QUENTIN (1746-95). The public accuser of the Revolutionary Tribunal during the Reign of Terror. He was born at Hérouel, in the Department of Aisne, practiced law there for some time, then came to Paris and turned police spy. On the outbreak of the Revolution he figured as one of the fiercest of democrats. By Robespierre he was appointed, first a member, then director and public accuser, of the Revolutionary Tribunal (March 10, 1793). He performed the duties of his office with a bloodthirsty relentlessness that came partly from lack of feeling, partly from a brutalized conception of duty. Regarding himself as the servant of the Revolution—though he was in reality only the tool of the Committee of Public Safety—he denounced impartially men of all parties and brought to the guillotine with equal fervor Bailly and Vergnaud, Danton and Hébert, Robespierre and

Saint-Just. After the passing of the Reign of Terror he was arrested and in May, 1795, guillotined, after a trial lasting 41 days. Consult Lenotre, "Madame Fouquier-Tinville" in his *Paris révolutionnaire* (Paris, 1904), and Duvernoy, *Fouquier-Tinville, accusateur public du Tribunal révolutionnaire* (ib., 1913).

FOURBERIES DE SCAPIN, fōor'be-re' de skā'pān', LES. A comedy by Molière (1671), based partly on the *Phormio* of Terence. There is an English translation by Otway (1677), under the title *The Cheats of Scapin*.

FOUR CANTONS, LAKE OF THE. See LUCERNE, LAKE OF.

FOURCHAMBAULT, fōor'shan'bo'. A manufacturing town in the Department of Nièvre, France, 5 miles by rail from Nevers, near the right bank of the Loire. It contains one of the most important iron foundries in France, which produces railroad supplies and art metal work in great quantities. Pop., 1901, 6152, 1911, 4882.

FOURCROY, fōor'krwa', ANTOINE FRANÇOIS, COUNT DE (1755-1809). A French chemist. He was born in Paris, the son of a druggist. He became a student of medicine, and in 1780 received the degree of doctor of medicine. About this time he delivered a course of popular lectures on chemistry and natural history which gained for him a high reputation. Buffon, in 1784, secured his appointment as professor of chemistry at the Jardin du Roi, now Jardin des Plantes, which position he held for 25 years. Fourcroy was one of the early converts to the theories of Lavoisier, together with whom and with Berthollet and Guyton de Morveau he prepared the *Méthode de nomenclature chimique* (Paris, 1787). In 1792 he was appointed a deputy to the National Convention, in 1794 he was made a member of the Committee of Public Safety, and in 1795 of the Council of Ancients. During the time of his service he endeavored to improve the system of public education and was especially active in measures for the reform of the national system of weights and measures which led to the metric system. He organized the Ecole Polytechnique and instituted schools of medicine. Under Napoleon he became Director General of Public Instruction in 1801. He was the author of *La philosophie chimique* (1792) and *Système des connaissances chimiques* (11 vols., 1801).

FOUREAU, fōor'ō', FERNAND (1850-1914). A French African explorer, born at Saint-Bai-bant (Haute-Vienne). In 1876 he began the exploration of southern Algeria and in 1883 first went into the Sahara. In 1898-1900 with Lamy he went from Biskra in Algeria to Lake Chad by way of Wargla, Agades, and Sinder, thence by the Shari River to the Congo, where two French forces joined. In 1906 he became Governor of the Comoro Islands. He published a map of the northern Sahara (1888), *Mission chez les Touareg, 1894-95* (1895), *Au Sahara* (1897), *Mission saharienne Fourreau-Lamy d'Alger au Congo par le Tchad* (1902), *Documents scientifiques de la mission saharienne* (1903-05).

FOUR-EYED FISH. See ANABLEPS.

FOURIER, fōor'ryā', FRANÇOIS CHARLES MARIE (1772-1837). A French Socialist. He was born at Besançon, April 7, 1772, the son of a merchant, and educated in the college there. At the age of 18 he entered a cloth business, although from his childhood he had shown an

antipathy towards commerce on account of the deception and injustice he saw in it. He visited all the large cities, not only in France, but in Holland and Germany, as a mercantile agent, thus gaining an opportunity for careful observation of social conditions. At his father's death he inherited 80,000 francs and invested it at Lyons in colonial products. During the siege of Lyons, in 1793, all his property was destroyed, his bales of cotton were used as breast-works, his provisions were taken to feed the soldiers, and he was himself thrown into prison. In 1794 he was drafted into the army and served for two years in a cavalry regiment, from which he was discharged on account of ill health. In 1799, as agent for a great provision merchant, he had to destroy a large quantity of rice which had been held for higher prices so long that it had become unfit for consumption. The destruction of food needed by the poor made a lasting impression on his mind. His business enterprises did not prosper, and for the greater part of his life he was in straitened circumstances. His chief works were the *Théorie des quatre mouvements et des destinées générales*, published in 1808, the *Traité d'association domestique agricole* (1822), which contains his whole system and was later republished under the title *Théorie de l'unité universelle*, and *Le nouveau monde industriel ou invention du procédé d'industrie attrayante et naturelle, distribuée en séries passionnées* (1829). Before his death he had a few followers, the most important one of whom was M. Just Muron, who was converted to Fourierism in 1814, but following his death his party gained many adherents. Consult his *Œuvres choisies* (1890), which contains a biographical sketch by Charles Gide. See **FOURIERISM** and the references given there.

FOURIER, JEAN BAPTISTE JOSEPH, BARON (1768-1830). A French geometer and physicist, born at Auxerre. He was the son of a poor tailor and was left an orphan at the age of eight. The Bishop of Auxerre, recognizing his ability, placed him in a Church military school, where he soon showed a decided aptitude for mathematics. At the age of 19 he wrote his memoir, *Sur la résolution des équations numériques de degré quelconque*, which was presented to the Academy in 1789. He took part in the Revolution, but in 1795 was sent as a student to the newly founded Ecole Normale, and soon after obtained the chair of analysis in the Ecole Polytechnique (1795-98). He went to Egypt in 1798 and was made perpetual secretary of the Institute of Cairo, and in the following year was placed at the head of one of the two scientific expeditions to the upper Nile. He returned to France in 1801 and was made (1802) Prefect of Isère, a position which he filled with his usual tact and energy. Napoleon created him a baron in 1808, but as, in 1814, he gave brief allegiance to the Bourbons, his political career was wrecked by the return of the Emperor from Elba. He was, after much difficulty, made a member of the Academy of Sciences in 1815 and succeeded Delambre (1822) as perpetual secretary for the mathematical sciences. He later became a member of the French Academy (1826) and succeeded Laplace (1827) as president of the council of the Ecole Polytechnique. Fourier was one of the leading mathematical physicists of his time. His labors were divided between the study of the theory of heat and of numerical equations. Among his

leading works are the following *Théorie analytique de la chaleur* (1822), *Analyse des équations déterminées* (posthumous, 1831), a memoir on statics (*Journal de l'Ecole Polytechnique*, 1797-98), and numerous memoirs on equations. His works, including references to numerous biographical sketches, were published by Darboux under the title *Œuvres de Fourier* (Paris, 1889-90).

Fourier's series, communicated by Fourier to the Academy towards the end of 1807, plays an important part in mathematical physics. Consult Du Bois-Reymond, *Zur Geschichte der trigonometrischen Reihen* (Tubingen, 1880).

FOURIERISM, foor'i-är-iz'm. This term is applied to the doctrines of Charles Fourier and to the communistic movement inspired by Fourier's teaching. Fourier claimed to have discovered a mathematical basis for social organization. The chief difference between the social system which he advocated and those of his contemporaries, Saint-Simon and Owen, is found in the retention, for a time at least, of private property and inheritance in Fourier's scheme. Fourier believed that man is capable of becoming perfect. His fundamental propositions were that the universe is governed by laws and that man, by means of reason, can discover these laws and can apply them to the organization of society. When this shall be done, social harmony will reign and unhappiness will be unknown. As yet, society is in its infancy. The different systems which the human race have established in the past have been only experiments, but each one has been superior to the one which it replaced. This development will continue until perfection is reached. The ideal, according to Fourier, has not been realized because our civilization is false—because the false sciences of ethics, economics, philosophy, and politics are followed instead of the true sciences—chemistry, physics, mathematics. The social organization outlined by Fourier is based on the *passions* or desires of man. There are 12 passions: five sensitive—seeing, hearing, smelling, feeling, and tasting; four affective—amity, love, paternity, and ambition, and three distributive—cabalistic, alternating, and composite. If all these passions are given free play, *passional attraction* causes the spontaneous formation of groups in society. The unit of society must be large enough to allow all the passions to operate freely in all possible combinations, and should therefore consist of about 2000 persons. Each group, or *phalanx*, should occupy a single building and provide itself with all the commodities and amusements desired. The chief occupations are agriculture, manufactures, commerce, domestic economy, art, science, education, and government. Within the phalanx the members are arranged in series and groups according to the law of passional attraction. Special groups are organized for each branch of industry. Individuals enroll themselves for those occupations for which they have natural aptitudes, and are allowed to change from one to another as often as they please. Thus work yields only pleasure. Fourier believed that association would economize expenditure and effort to such an extent that a man would need to work only 10 years of his life. Under his system salaries are abolished; each person receives an ample minimum, and the surplus is distributed according to the amount of labor, capital, and skill contributed—five parts to labor,

four to capital, and three to talent. There are no drones, since all the people are eager to confer benefits upon society. Surplus products are exchanged between phalanxes. Industrial armies are sent out to prepare new lands for occupation. Government, so far as there is any, is republican, with annual election of officers. Since there is no discord, there are no soldiers, policemen, or criminals. At first Fourier expected society to become practically anarchistic, but later he found it necessary to map out a definite hierarchical scheme of government. The unit, of course, is the phalanx, which is ruled by a *unarch*. Three or four phalanxes form a union, three or four unions a district, a number of districts a province. Nations, empires, caliphates, regions, continents, and finally a world unity are formed by similar combinations. The rulers, in hierarchical succession above the unarch, are called duarchs, triarchs, and so on, up to the omnarch, who rules the whole world. In addition to unity of government, there is unity of language, of weights and measures, of surveying. In fact, unity is one of Fourier's fundamental concepts. He maintained that the law of gravitation governs not only matter, but the other three movements—social, animal, and organic—as well. He found three indestructible principles—God, or spirit, the active and moving principle, matter, the passive principle, and justice or mathematics, the regulating principle to which reason corresponds. Fourier claimed that the human race will remain on this earth until a cycle of 80,000 years has been completed. The period of manhood is at hand. The race will continue to develop for 35,000 years and then decline for 40,000 years.

After the death of Fourier his party made a large number of converts in France and many communities were formed to test his system. In every case where Fourier's suggestions were followed in detail the attempt failed. M. Jean Godin (q.v.) founded at Guise a community where labor and capital are associated much after the plan of Fourier, but with many objectionable features left out. The establishment consists of iron, copper, sugar, and chicory factories and has been very prosperous. In the United States Fourierism was introduced in 1842 by Albert Brisbane and spread like an epidemic. No less than 34 associations were formed in all parts of the North and West, but few held out for more than four or five years. The most notable of all was Brook Farm (q.v.). See COMMUNISM, SOCIALISM.

Consult Charles Pallarin, *Charles Fourier, sa vie et sa théorie* (Paris, 1843); E. Sambuc, *Le socialisme de Fourier* (ib., 1899); Richard T. Ely, *French and German Socialism* (New York, 1883); E. Fournière, *Les théories socialistes au XIXe siècle* (Paris, 1904); Bourguin, *Fourier contribution à l'étude du socialisme français* (ib., 1905); d'Isambert, *Les idées socialistes en France* (ib., 1905); Gide and Rist, *Histoire des doctrines économiques* (ib., 1909). For a literary exposition of the ideals and plans of modern Fourierists, see Emile Zola's novel *Travail*.

FOURIER SERIES. In mathematics and mathematical physics, a series whose terms are made up of sines and cosines of multiples of a variable angle, the general form being $a_0 + a_1 \sin x + b_1 \cos x + a_2 \sin 2x + b_2 \cos 2x + a_3 \sin 3x + b_3 \cos 3x + \dots$, where the a 's and b 's are constants. These series have the great advantage for purposes of physics that they can

represent not only continuous functions with a continuous derivative, but also functions presenting a considerable range of discontinuities, e.g., a broken line or a curve made up of pieces of different analytic curves even with sudden breaks in the value of the corresponding function. Thus the series $\sin x + \sin 3x + \sin 5x + \dots$ has the sum $\pi/4$ if x lies between 0 and π , but the sum is $-\pi/4$ if x is between $-\pi$ and 0. For $x = 0$ the sum is 0. By methods of the integral calculus the coefficients a and b can be so determined that the series shall represent any given function provided the latter has only a finite number of singularities in the region considered. The series may be employed to express the ordinate of a point on a vibrating string, the temperature in a body exposed to heat, the altitude of the tides, the varying pressure of the atmosphere, etc. Especially where the phenomena are periodic, the Fourier series is of great use, since it resolves them into their component periods. Thus, if the coefficients a and b are found to diminish rapidly after the first few, the early terms of the series represent the phenomenon broken up into components of periods $\pi, \frac{1}{2}\pi, \frac{1}{3}\pi, \dots$, and by writing kx for x the periods can be made to take any values $\pi/k, \frac{1}{2}\pi/k, \dots$.

The Fourier series were employed by Daniel Bernoulli, Euler, Lagrange, and other older mathematicians. They receive their name from J. B. Fourier (q.v.), who gave the first elaborate account of them in his celebrated work, *Théorie analytique de la chaleur* (1835). The difficult mathematical questions as to the convergence of the series, etc., were investigated by Dirichlet, Riemann, and others. Consult Weber-Riemann, *Die partiellen Differential-Gleichungen der mathematischen Physik* (4th ed., Leipzig, 1900); Böcher, "Introduction to the Theory of Fourier's Series," in *Annals of Mathematics*, Ser. 2, vol. vii (Princeton, N. J., 1906); Hobson, *On the Theory of Functions of a Real Variable and on the Theory of Fourier's Series* (New York, 1907); Van Vleck, "The influence of Fourier's Series upon the Development of Mathematics," in *Science*, vol. xxix, No. 995 (New York, Jan. 23, 1914).

FOUR-IN-HAND DRIVING. See COACHING, DRIVING.

FOUR LAKES. The term used to designate four closely connected Wisconsin lakes, called respectively Mendota, Monona, Waubesa, and Kegonsa, whose outlet, the Yahara River, flows into Rock River, one of the upper affluents of the Mississippi. They are navigable for steamboats and drain a beautiful country. The waters are clear and cold. Madison, the capital of the State, lies between Mendota and Monona, the two largest lakes. The combined area of the four lakes is about 28 square miles.

FOUR-LINED SNAKE. See CHICKEN SNAKE.

FOURMIES, foor'mé'. A manufacturing town and railway junction, in the Department of Nord, France, 36 miles southeast of Valenciennes (Map France, N, K 2). It contains numerous cotton and woolen mills and other industrial establishments, and in the vicinity are large iron mines. Pop., 1901, 14,083, 1911, 14,143.

FOURNEL, foor'nél', FRANÇOIS VICTOR (1829-94). A French author, born at Cheppy, near Varennes, and educated at Verdun and Paris. He went into journalism in Paris (1854) and

was attached to the editorial staffs of *Le Français*, *Monteur Universel*, and *Gaulois*. His publications include *Les Contemporains de Molière* (3 vols, 1863-76), *Curiosités théâtrales* (1859), *Esquisses et croquis parisiens* (1876), *Vacances d'un journaliste* (1876), *Voyages hors de ma chambre* (1878), *Aux pays du soleil* (1883), *L'ancêtre* (1881), *Figures d'hier et d'aujourd'hui* (1883), *De Malherbe à Bossuet* (1884), *Petites comédies rares et curieuses du XVII^{ème} siècle* (1884), *Les artistes français contemporains* (1885), *La confession d'un père* (1886), which was crowned by the Academy, *Maman capitaine* (1889), *Les hommes du 14 juillet* (1890).

FOURNET, foor'nā', JOSEPH JEAN BAPTISTE XAVIER (1801-69). A French geologist and meteorologist, born at Strassburg and educated at the School of Mines in Paris. He took part in several geological exploration expeditions, and in 1834 became professor of geology in the faculty at Lyons, which position he retained until his death. He was an authority upon the geology of the Alps and of southeastern France, and his original investigations were of considerable note, especially his discovery in connection with the sulphurization of metals, which was named, in his honor, "Fournet's law." He was a prolific contributor to various scientific publications and annals. Among his other publications were *Géologie lyonnaise* (1862) and *Du mineur, son rôle et son influence sur les progrès de la civilisation* (1862).

FOURNIER, foor'nyā', (JEAN) ALFRED (1832-1914). A French physician, specialist in skin diseases. He was born in Paris and was a pupil of Ricord. He was interne in 1854, and in 1863 became physician at the Lourcine Hospital, where he began his studies and lectures on syphilis, on which he wrote extensively. He was clinical professor in this branch at the University of Paris from 1880 to 1905, and from 1884 to 1905 at the Hospital St Louis. He became Commander of the Legion of Honor. His publications include *Recherches sur la contagion du chancre* (1857), *Recherches sur l'incubation de la syphilis* (1865), *Syphilis et mariage* (1880), *Prophylaxie publique de la syphilis* (1887), *Traitement de la syphilis* (1893, Eng trans, 1906).

FOURNIER, AUGUST (1850-) An Austrian historian, born and educated in Vienna, where he served in the Ministry of the Interior and in 1875 was instructor in history at the university. Appointed assistant professor in 1880, he was called to the University of Prague in 1883 and returned as full professor to Vienna in 1903. As a member of the Reichsrat (1891-1900) and of the Bohemian Diet (1892-1901), he belonged to the German Liberal party. Of his writings, *Napoleon I, Eine Biographie* (1886-89), which was immediately translated into French (Eng trans by Corwin and Bissell, 1903, and a later trans by Adams, 1912), is the most noteworthy. His other works include *Genitz und Cobenzl Geschichte der oesterreichischen Diplomatie, 1801-05* (1880), *Handel und Verkehr in Ungarn und Polen um die Mitte des 18. Jahrhunderts* (1887), *Der Kongress von Châtillon* (1900), *Historische Studien und Skizzen III* (1912), *Die Geheimpolizei an dem Wiener Kongress* (1913).

FOURNIER, PAUL [EUGÈNE LOUIS] (1853-) A French jurist, born at Calais. He

was educated at the Ecole des Chartes and became professor of Roman law at Grenoble. He was an authority on canonical law. He wrote *La question agraire en Irlande* (1882), several important articles on the "False Decretals", *Le Liber Tarraconensis*, "Études sur une collection canonique du XI^{ème} siècle," in *Mélanges Julien Havet* (1895), "Les collections canoniques attribuées à Yves de Chartres," in *Bibliothèque de l'Ecole des Chartes* (1896); "Joachim de Flore. Ses doctrines, son influence," in *Revue des questions historiques* (1900).

FOURNIER, PIERRE SIMON (1712-68). A French type founder and author. He was born in Paris and probably received his first instruction from his father, who was director of the foundry of Guillaume Le Bé, and from the painter Colson. In 1736 he established his own foundry, the entire material for which he manufactured himself. Especially celebrated were his ornamented letters. He also contributed greatly to the improvement of musical type, which subject he discussed in a special work. He further had the distinction of publishing the first *Manuel typographique* (1764-66), a work which became exceedingly popular, and remained so long after the death of its author. Among his principal publications may be mentioned *De l'origine et des productions de l'imprimerie primitive en taille de bois* (1759) and *Traité historique et critique sur l'origine et les progrès des caractères de fonte pour l'impression de la musique* (1765).

FOURNIER, TÉLESPHORE (1824-96). A Canadian jurist, born in Saint-François, Quebec. He was educated at Nicolet College and was called to the bar of Lower Canada in 1846. He was elected a Liberal member of the Dominion Parliament in 1870, and in 1873 took his seat as Minister of Internal Revenue in the Mackenzie cabinet. He was transferred to the portfolio of Justice in the summer of 1874, and from May to October, 1875, was Postmaster-General. While Minister of Justice he introduced and was largely instrumental in passing the Supreme Court Act, although the constitution of that court was planned chiefly by Edward Blake (qv). In 1875 Fournier procured the passage of an important insolvency act. Appointed (1875) a puisne judge of the Supreme Court of Canada, he retained that position until his death.

FOURNIER L'HÉRITIER, lā're-tyā', CLAUDE (1745-1825). A French Revolutionist, born at Auzon. He went to Haiti and engaged in the manufacture of rum, but his factory was burnt. Upon returning to France, he was called, for his stay in the New World, *L'Américain*. He was active in all the great revolutionary days of 1789-92, especially the risings of Oct 5-6, 1789, July 17, 1791, and June 20 and Aug 10, 1792, was accused of plotting the murder of the Orléans prisoners who were killed while under his charge (1792), but was not found guilty, and, in spite of Marat's joining his accusers, was equally fortunate when accused of inciting insurrection. He was in the infernal-machine plot of the Rue Saint-Nicaise, was found guilty and deported, and did not return until 1809. In 1811 he was again a conspirator and was sent to the Château d'If, was set free by the First Restoration, and was accused of a plot against the Bourbons after their second return, but set free again in 1816. In his last years he

paraded his royalist sentiments in hopes of a pension, but died a poor man. Consult Anlard's edition of his *Mémoires secrets* (Paris, 1890).

FOUR PRENTICES OF LONDON, THE. A chronicle play by Thomas Heywood, written about 1600 and printed in 1615 and 1632. It was attacked by Beaumont and Fletcher in *The Knight of the Burning Pestle*.

FOUR P'S, THE. The best known of the *Interludes* by John Heywood (c1543). The Four P's are a Palmer, a Pardoner, a Potecary, and a Pedlar.

FOUR SONS OF AYMON, THE. See **AYMON**.

FOURTH DIMENSION. See **GEOMETRY**.

FOURTH DISEASE. **DUKES' DISEASE.** A mild eruptive fever resembling measles, scarlet fever, and German measles. It was first described by Dr Clement Dukes in 1900. Many observers doubt its existence as a separate entity and consider it either a double infection of scarlet fever and German measles or an atypical form of one of these diseases. The incubation period is about the same as that of German measles (9 to 20 days), and the disease is ushered in by malaise, mild sore throat, and the appearance of the rash, which covers the body in a few hours.

FOURTH PARTY, THE. A name applied, about 1880, to an opposition group within the English Conservative party, under the leadership of Lord Randolph Churchill (qv).

FOURTH STATE OF MATTER. See **MATTER**. *Theories of Matter*.

FOURTOU, fū'rtō', (MARIE FRANÇOIS) OSCAR BARDY DE (1836-97). A French politician. He was born at Ribérac (Dordogne) and was educated at Portiers. After acting as mayor of his native town, he was elected a member of the National Assembly in 1871. He was a defender of Thiers and became Minister of Public Works (1872), Minister of Public Instruction (1873-74), and Minister of the Interior (1874 and 1877). He was identified with the Clerical Bonapartist party, and as Minister of the Interior conducted a vigorous and aggressive campaign against the Republicans, dismissing from office all prominent representatives of that party and persecuting the Republican press. He supported MacMahon in his electoral campaign in 1877 and lost his seat in the Chamber of Deputies in that year. He was reelected to the Lower House in 1879 and, after serving (1880-85) in the Senate, again in 1889. He wrote *Histoire de Louis XVI* (1840), *Mme Swetchine* (1859), *Mémoires d'un royaliste* (1888).

FOUSSA. See **FOSSA**.

FOVILLE, fō'vel', ALFRED DE (1842-1913). A French political economist and statistician, son of a distinguished alienist, born in Paris and educated at the Polytechnique. He served successively as auditor of the Council of State, chief of the Bureau of Statistics, and professor at the School of Political Science. In 1877 he became editor of the official *Bulletin de statistique et de législation comparée*. His publications include *Mémoire sur les variations des prix au XIX^{ème} siècle* (1872), *La transformation des moyens de transport et ses conséquences économiques et sociales* (1880), *Atlas de statistique financière* (1881, 1889), *La richesse en France et à l'étranger* (1893), *L'industrie des transports dans le passé et dans le présent* (1893), *Les conditions de l'habitation en France* (1894-99), *La monnaie* (1907); and hundreds

of articles in the *Economiste français*. Consult the sketch by Faure in *Revue politique et parlementaire*, vol lxxviii (Paris, 1913), pp 381-430.

FOWEY, for A seaport town of Cornwall, England, at the mouth of the Fowey, on the south coast, 22 miles west of Plymouth (Map England, B 6). It is noted for its situation amid hill and cliff scenery, and is a favorite resort for artists. It has a deep harbor, with a narrow entrance guarded by three forts. In the thirteenth and fourteenth centuries it was one of the chief seaports of England and its "Gallants of Fowey" aided greatly in founding England's naval power. Its principal industry is the pilchard fishery, and it has a considerable export trade in the chinastone and iron ore of neighboring quarries and mines. Pop (parish), 1901, 2258, 1911, 2276.

FOWKE, fōuk, GERARD (born SMITH) (1855-) An American archaeologist and ethnologist, born in Maysville, Ky. For many years he was connected with the United States Bureau of Ethnology in investigations in the eastern United States and in the Ohio valley. The results of his discoveries were published in the *Annual Reports* of the bureau. In 1894 and 1896 he investigated the supposed Norse remains near Boston. Afterward he was engaged in explorations on Vancouver Island and in 1898 explored the lower Amur River, Siberia. After three years of investigation of glacial deposits and channels of the Ohio valley he took up work for the Missouri Historical Society at St Louis in 1911. He wrote *Archeological History of Ohio* (1902) and *Montezuma Mounds* (1905).

FOWL (AS *fugol*, OHG. *fogal*, Ger. *Vogel*, Goth *fugls*, bird, fowl). A word commonly used now in a restricted application to useful birds, chiefly of the gallinaceous order. Thus, "wild fowl" and "waterfowl" mean those birds of land and water respectively in which sportsmen are interested, and "barnyard fowl" are the domesticated kinds—poultry. When used in the singular, however, the word almost invariably signifies a full-grown domestic chicken.

Domestic Chickens. Chickens are raised in the United States for their flesh, for the production of eggs, and as fancy stock for exhibition purposes. According to Howard there are 87 standard and a large number of promiscuous varieties of chickens raised in the United States, which have been divided into 10 classes. For practical purposes the 10 classes may be grouped into four general classes as follows: (1) general-purpose breeds, the American class, (2) meat or table breeds, the Asiatic class, (3) egg-making breeds, the Mediterranean class, (4) ornamental breeds, the Polish, exhibition games, miscellaneous, and bantam classes.

The *Plymouth Rock* is the most popular of all breeds of chickens for general purposes. It is of medium size, hardy growth, and good egg-laying qualities. The barred variety is the most generally known. It is of a grayish-white color, regularly crossed with parallel bars of blue-black running in straight distinct lines throughout the entire length of the feathers. The standard weight of the cocks is nine and one-half pounds, and of hens, seven and one-half pounds. Other varieties of *Plymouth Rock* are very like the barred except in color. The *Wyandottes* (qv) are rated next to the *Plymouth Rocks* as general-purpose fowls. The *Light Brahma*, which became popular between 1850 and 1860, is the

leading variety of the Asiatic class. The male is pure white in color excepting the hackle, tail, and flights, which are black, and white striped with black. The shanks are well feathered, with the feathering extending down to the middle toe. The Brahma female has a white head, hackle white, striped with black, cape white and black, completely covered by the hackle when the bird stands erect. The average Light Brahma male is 26 inches in height. The standard weight of the cock is 12 pounds, of the hen, nine and one-half pounds. The *Cochins* are second only to the Brahmas for edible purposes, weighing somewhat less than the Light Brahmas. There are several varieties of *Cochins*—buff, partridge, black, and white. All have heavy leg and foot feathers. The *Leghorns* are the best known of the egg-producing varieties of the Mediterranean class. They mature early and feather quickly. The pullets often begin laying when four months old. There are a number of varieties of *Leghorns* which differ in color and in the form of comb, which in all cases is large and a distinguishing mark of the breed. The *Leghorn* cock has a graceful, round, and plump body, broad at the shoulders and tapering towards the tail. The *Leghorn* hen in many respects resembles the cock in shape and carriage, and is even more graceful. The *Ornamental Breeds* vary greatly. Bantams are characterized by their small size, the silky fowls by their soft webless feathers, which when in prime condition are less fluffy and stand out from the body in all directions, and the *Yokohama* fowls by the great length of the tail and hackle feathers, the tail feathers of the cock sometimes attaining a length of 6 feet or more. The *Games* are commonly divided into two distinct varieties—exhibition and pit. The exhibition game is long, lanky, close-feathered throughout and spare in tail feathering. The pit is short, stout, and stocky, with abundant tail feathering, and for the farm and general purposes has always been considered a practical and profitable fowl. It is hardy, matures early, is a good layer, and its flesh is considered of exceptional value for the table, being fine-grained, tender, and sweet. The hens are splendid sitters and careful mothers. See Plate accompanying POULTRY.

Industrial Considerations. Chicken raising, an important industry whether conducted as a special business or as a part of general farming, depends upon suitable houses and proper care and feeding. It is very desirable that chickens be provided with a house somewhat separated from the other farm buildings, but near enough to the barnyard so that they can spend a part of their time in scratching for and gathering up the many seeds and grains that would otherwise not be utilized. Poultry houses need not be elaborate in their fittings or expensive in their construction. Material and construction will vary in different regions, but the houses should always be planned with regard to cleanliness and convenience. They should be cool in summer and warm in winter, and, when it is not desirable to allow poultry free range, the houses should be provided with yards or runs, because chickens need exercise. Coops for young chickens are of various styles, some being very simple and others provided with yards covered with netting to exclude hawks and cats. The poultry house should be located upon soil which is well drained and dry. A gravelly knoll is best, but, failing this, the site should be

raised by the use of the plow or scraper until there is a gentle slope in all directions, sufficient to prevent any standing water even at the wettest times. A few inches of sand or gravel on the surface will be very useful in preventing the formation of mud. A group of evergreens or other windbreak will be a decided advantage in sheltering the house from the north and northwest winds in the colder parts of the country.

The amount of space to be allowed per chicken depends upon the size of the fowls, whether a shed is attached to the house, and whether the fowls have free run of the open fields. For chickens in confinement there should be from 6 to 15 square feet for each adult bird in case there is no shed attached to the house, with a shed this space may be reduced about one-half. The yards should be large enough to allow exercise in the open air and to furnish more grass than the birds will eat. This will vary from 60 to 150 square feet per adult bird. An open shed facing the south is of great assistance in maintaining the health and productiveness of the flock. In it the birds can be induced to hunt for their food and take exercise in all seasons of the year, and they can enjoy scratching and dusting themselves in the sunshine, even during the winter months. Chicken houses provided with earth floors are frequently damp and unsatisfactory and the cause of various poultry diseases. Cement floors are cold and also more or less damp. According to D. A. Salmon, who is authority for many of the statements given here, a good cement floor laid on broken stone and covered with a few inches of earth would probably be satisfactory, if not too expensive. A board floor, 6 or 8 inches above the earth, with good ventilation under it, is dry but too cold, except in the South. A double flooring, laid tightly with building paper between, or a good single flooring covered with a few inches of dry earth, is probably the best. In all cases of board floors there should be sufficient space beneath for ventilation and to guard against lodgment of rats. Convenient roosts should be provided. They should be nearly flat or rounded slightly on the upper surfaces. Crevices in which vermin may hide should be avoided. Such precautions suffice in most cases to keep the poultry free from chicken lice, the characteristics of which are given under LOUSE. The roosting space allowed should be 6 to 8 inches for the small breeds, 8 to 10 inches for the medium, and 10 to 12 inches for the large breeds of chickens.

Nests and Eggs. Suitable nests are an essential requirement for egg-laying stock. The simplest form of nest is a box placed upon the floor of the poultry house. With heavy fowls, which are apt to break their eggs in fighting away other hens that try to enter their nests when they are laying, and thus acquire a habit of egg eating, a more concealed or dark nest may be necessary. Although on small farms, in towns, and in villages it is generally necessary to confine poultry in houses and yards, there are many large farms where poultry may be raised with the greatest economy by allowing them to range. The large area at their disposal furnishes an exhaustless supply of insects and worms and an abundance of water, seeds, and grains which chickens alone can utilize. Under such circumstances fowls take care of themselves so well and are so energetic in seeking their

food that they are either forgotten, and allowed to shift for themselves when they really need attention and assistance, or they are regarded as a nuisance because they sometimes do a little damage. When fenced away from the garden and flower beds, fowls do little damage and cause scarcely any annoyance on a farm. On the other hand, they do an immense amount of good in the protection of crops by the destruction of injurious insects, larvæ, and worms and are especially useful on fruit farms. Eggs are hatched under the hens or in incubators. Incubator chicks may be conveniently cared for in brooders or "artificial mothers." Many incubators and brooders have been devised which have been shown by experience to be satisfactory.

Feeding. Chickens require a mixed diet of grain, animal food, and green or succulent materials. The food must also supply the lime and other mineral matters needed for eggshells, and an abundance of grit, required for digesting food, is also essential. Pure water should at all times be provided. A number of forms of drinking fountains have been provided to meet the latter requirements. When only a small flock of hens is kept, chiefly to provide eggs for family use, a mistake is frequently made in feeding too much corn. It has been shown by experiments that corn should not form a very large portion of the grain ration of laying hens, as it is too fattening, especially for hens kept in close confinement. Corn, no doubt because of its cheapness and abundance, has generally been considered in the United States to be the most valuable poultry food. In recent years, more than formerly, wheat has been fed and the poultry ration thereby improved. Wheat is preferable to corn, and oats are an excellent food, better, perhaps, than any other single grain, particularly if the hull has been removed. When comfortable quarters are provided, fowls kept for egg production should have a ration with a nutritive ratio of about 1:4. When poultry is fed for the production of flesh, the ration should contain more fat and carbohydrates in proportion to the protein, i.e., it should have a wider nutritive ratio than the ration cited for egg production. For forcing fowls for egg production, as in forcing animals for a large yield of milk, the ration should be made up of a number of kinds of grain. Experiments have shown that fowls not only eat their food with better relish if it is composed of many kinds of grain, but that the proportion digested is larger than when made up of fewer constituents. The food consumed has an effect upon the flavor of eggs, and in extreme cases upon the odor also. Thus, onions when fed for a considerable time produce a noticeable flavor in eggs. The majority of poultry raisers believe that ground food or soft food should form a part of the daily ration and that it is desirable to feed soft food in the morning, as it will be digested and assimilated quicker than will whole grain. A mixture of equal parts by weight of corn meal and ground oats added to an equal quantity of wheat, bran, and fine middlings is recommended as a satisfactory food if mixed with milk or water. It should be thoroughly wet without being sloppy. The dry-grain ration should consist largely of whole wheat with some oats and perhaps a little cracked corn. This should be scattered in the litter, which should always cover the floor of poultry houses, in order that the fowls be compelled to seek the corn, and thus obtain a con-

siderable amount of exercise. The litter also insures cleanliness. Straw, chaff, buckwheat hulls, and cut cornstalks all make excellent litter. At night, just before the fowls go to their perches, they should have all the corn they will eat up clean. Some green food should be given to poultry, although perhaps it is not absolutely necessary. Clover, rape, cabbage, etc., are recommended for the purpose. Green food is especially desirable when chickens are kept in yards throughout the entire year.

Fowls as Food. The flesh of chickens is esteemed for its delicate flavor. The young chickens are often spoken of as broilers. For composition and food values of broilers and fowls, see tables under Food.

Chickens are ordinarily broiled or fried, roasted or baked, boiled or stewed, and are seasoned and garnished in many different ways. While delicate flavor and appetizing appearance contribute to the popular esteem in which poultry are held in all regions, there is an additional reason for their extended use in warm climates. This is the fact that poultry may be kept alive and killed as they are needed for the table, thus when means of cold storage are absent, the loss from spoiling may be much more readily avoided than is the case with larger animals used for food. It is commonly believed that the flesh of poultry is quite thoroughly and easily digested, and thus especially suited for the diet of invalids. The value of eggs as food and their place in the diet are discussed under the title Eggs.

The census of 1900 gave the number of chickens in the United States as 233,598,085 and the eggs produced as 1,591,311,171 dozens.

Bibliography. A very large number of books have been published on the general subject of poultry, among which are the following: Howard, "Standard Varieties of Chickens," in *United States Department of Agriculture, Farmers' Bulletin 51*, illustrated (Washington, 1900), McGraw, "The Plymouth Rock" and "The Wyandotte," in *United States Department of Agriculture, Bureau of Animal Industry, Bulletins 29 and 31* respectively (ib, 1901), Collingwood, *The Business Hen* (New York, 1904), Robinson, *Principles and Practice of Poultry Culture* (ib, 1912), Valentine, *The Beginner in Poultry* (ib, 1912), Weir, *The Poultry Book* (ib, 1912), Watson, *Farm Poultry* (ib, 1912), Lewis, *Productive Poultry Industry* (Philadelphia, 1913), Shaw, *Encyclopedia of the Poultry Yard* (New York, 1913).

FOWL CHOLERA. A virulent infectious disease of poultry common in Europe and America, which takes the form of a septicæmia and is due to a specific microorganism. It was first studied in 1782 and was referred to anthrax. Chickens are especially susceptible, but it occurs also in geese, ducks, pigeons, and even rabbits. Three forms of the disease are recognized—the apoplectic, the acute, and the chronic. In the first form the bird becomes suddenly dull, the wings droop, the eyelids fall and the feathers are elevated, the comb soon turns purple, the temperature rises to about 43° C., and death occurs within from two to five hours. In the second form the same symptoms appear with the addition of acute diarrhœa, but the bird afflicted may suffer from 12 to 60 hours or perhaps recover after the diarrhœa has persisted for about two weeks. In the chronic form a permanent or an intermittent diarrhœa is the

most marked symptom, and death from extreme emaciation and exhaustion is postponed for some weeks

The microorganism may gain entrance to healthy birds through the mucous membranes of the eye, respiratory and alimentary tracts. The blood, all mucous and serous secretions, and excrementitious matter from affected birds are virulent, but when exposed to heat, fresh air, or direct sunlight, they become innocuous. The virus may be destroyed by a one per cent solution of salicylic, benzoic, or carbolic acid. Healthy birds may be immunized by inoculation with attenuated virus or with serum from immunized birds. No medicinal treatment is of any avail in the apoplectic and acute forms. In chronic cases dilute acids sometimes assist the birds to recover. After an outbreak of this disease the poultry quarters should be cleaned and disinfected. Healthy birds should not be allowed to run on the ground where diseased birds have been. Consult Salmon, *Poultry Diseases* (Washington, 1902), Theobald, *Parasitic Diseases of Poultry* (London, 1896), Hutyra and Marek, *Special Pathology and Therapeutics of the Diseases of Domestic Animals*, vol 1 (New York, 1913), E W Hoare, *A System of Veterinary Medicine*, vol 1 (ib, 1913), J Law, *Text-Book of Veterinary Medicine*, vol 1v (Ithaca, 1905-11)

FOWLER, CHARLES HENRY (1837-1908) An American Methodist Episcopal bishop, born in Burford (Ontario), Canada. He graduated at Syracuse University in 1859 and at Garrett Biblical Institute in 1861, entered the ministry in 1861 and held various pastorates in Chicago, Ill. From 1872 to 1876 he was president of Northwestern University, in 1876 he became editor of the *Christian Advocate*, of New York, and in 1880 missionary secretary. In 1884 he was elected Bishop. He visited South America in 1885 and organized there a very efficient missionary work. Three years later (1888), on a tour around the world, he founded Peking University and Nanking University in central China and organized the first Methodist Episcopal church in St Petersburg, Russia. He assisted in establishing Nebraska Wesleyan University (University Place, Neb.) At the English Wesleyan General Conference of 1898 he proposed the Twentieth Century Thank Offering of \$20,000,000, which was completed in 1902. He was the author of *Colenso's Fallacies* (1864), *Missions and World Movements* (1903), *Missionary Addresses* (1906), *Addresses on Notable Occasions* (1908), *Patriotic Orations* (1910)

FOWLER, ELLEN THORNEYCROFT (c1873-) An English novelist, eldest daughter of Lord Wolverhampton (Sir Henry Fowler), Secretary of State for India in 1894-95. Miss Fowler took as her residence Woodthorne, Wolverhampton, Staffordshire. After publishing several volumes of mediocre verse and a volume of short stories (*Cupid's Garden*, 1897), she at once gained popularity by a clever society novel entitled *Concerning Isabel Carnaby* (1898). Many other books followed, among them *A Double Thread* (1899), *The Farringtons* (1900); *Fuel of Fire* (1902), *The Wisdom of Folly* (1910), *Her Ladyship's Conscience* (1913), *Place and Power* (1914)

FOWLER, FRANK (1852-1910) An American figure and portrait painter. He was born in Brooklyn, N Y, and studied painting for two years in Florence, Italy, under Edwin White

and seven years in Paris under Carolus Duran and at the Ecole des Beaux-Arts. He rendered valuable assistance to Duran on the fresco of Marie de Médicis in the Luxembourg. On his return to New York, in 1879, he devoted himself for a time to mural painting, his most important work being the decoration of the ballroom of the Waldorf Hotel (1892). Later he painted chiefly portraits, including a number of public men, notably Governors Tilden and Flower, now in the State Capitol, Albany, Archbishop Corrigan, Charles A Dana, and others. He wrote upon art topics for the magazines and several textbooks, including *Oil Painting* (1885) and *Portrait and Figure Painting* (1901). His technique is broad, with a fresh and delicate treatment, and he gives a faithful rendering of his subjects, with a poetic and imaginative conception. At the St Louis Exposition (1904) he exhibited portraits of John Reid, W D Howells, and Allen P Fowler, in 1905, that of C W Larned, in 1907, "Isabel", in 1908, "The Yellow Scarf", and in 1910, the "Portrait of a Child". There was a memorial exhibition of his works at the Lotos Club, New York, in 1911, and an exhibition of the paintings and pastels left in his studio at the Anderson Galleries, New York, in 1912, including many landscape studies. He was elected to the National Academy in 1899.

FOWLER, HAROLD NORTH (1859-) An American classical scholar, born at Westfield, Mass. He graduated from Harvard University in 1880 and in 1883-85 studied at Berlin and at Bonn, where he gained his Ph D. He was professor of Greek in the University of Texas (1892-93) and in the College for Women, Western Reserve University, after 1893, and was associate editor, and after 1906 editor in chief, of the *American Journal of Archaeology*. In 1912 he was elected president of the American Philological Association. He edited Thucydides, book v (Boston, 1888), and Plautus's *Menæchmi* (ib, 1899), etc; wrote a *History of Ancient Greek Literature* (1902), *History of Roman Literature* (1903), *A Handbook of Greek Archaeology* (with J R Wheeler, New York, 1909), and published (New York, 1914) the first two volumes of a translation of Plato, in the Loeb Classical Library.

FOWLER, HENRY HARTLEY, VISCOUNT WOLVERHAMPTON (1830-1911) An English statesman, born at Durham. He was a Liberal member of Parliament for the undivided Borough of Wolverhampton from 1880 to 1885 and thereafter represented the East Division. At the close of the Gladstone administration of 1880 he was Undersecretary of State at the Home Office (1884-85). He became Financial Secretary to the Treasury and Privy Councillor in 1886, from 1892 to 1894 was President of the Local Government Board, and in 1894-95 was Secretary of State for India. He was Chancellor of the Duchy of Lancaster in 1905-08 and was made Viscount in 1908. He retired from the cabinet in 1910. The son of a Wesleyan Methodist minister, he was prominent in that denomination and as a representative of nonconformists in politics.

FOWLER, SIR JOHN (1817-98) A British hydraulic and railway engineer. He was born in Sheffield, England, and after engaging in various important works, in 1839 he became acting engineer in the construction of the Stockton and Hartlepool railways. At the age of 27

he was selected as engineer for the construction of the large group of railways known as the Manchester, Sheffield, and Lincolnshire. Having settled in London, he was continuously employed in the laying out and construction of railways and docks and in the improvement of rivers and reclamation of lands from the sea. He designed and constructed the Metropolitan Underground Railway of London, with Sir Benjamin Baker designed and constructed the great Forth Bridge (1890), was for many years consulting engineer to the Egyptian government, and was made Baronet in 1890.

FOWLER, THOMAS (1832-1904). An English educator and philosopher, president of Corpus Christi College, Oxford. He was born at Burton-upon-Stather, Lincolnshire, and was educated at King William's College, Isle of Man, and at Merton College, Oxford, where he graduated in 1854. In 1855 he became a fellow and tutor of Lincoln College, Oxford. He won the Denyer Theological Essay prize in 1858, was made select preacher in 1872, and was elected professor of logic in 1873. This chair he occupied until 1889, becoming meantime (1881) president of Corpus Christi College. From 1899 to 1901 he was vice chancellor of the University of Oxford. His publications include *The Elements of Deductive Logic* (1867, 10th ed, 1892), *The Elements of Inductive Logic* (1870, 6th ed, 1892), *Locke*, in "English Men of Letters" (1880), *Bacon's Novum Organum* (1889), *Locke's Conduct of the Understanding* (3d ed, 1890), *Francis Bacon* (1881) and *Shaftesbury and Hutcheson* (1882), in "English Philosophers Series", *History of Corpus Christi College* (1898), *Progressive Morality An Essay in Ethics* (1895), and, with J M Wilson, *Principles of Morals* (1885-87).

FOWLER, WILLIAM WARDE (1847-1921). An English classical scholar, born in Somerset. He was educated at Lincoln College, Oxford, of which he was scholar (1866), fellow (1872), and subrector (1881-1904). In 1909 he was Gifford lecturer at Edinburgh. He wrote several books on birds: *A Year with the Birds* (1886), *Tales of the Birds* (1888), *More Tales of the Birds* (1902). But his really important work was in classical history, especially religious and social, in such books as *Julius Caesar and the Foundation of the Roman Imperial System* (1892), *The City-State of the Greeks and Romans* (1893), *Roman Festivals of the Republic* (1899), *Social Life at Rome in the Age of Cicero* (1908), *The Religious Experience of the Roman People* (1911), a short sketch of Rome (1912), *Roman Ideas of Duty in the Last Century before the Christian Era* (1914).

FOWLER'S SOLUTION. See ARSENIC

FOWLING. See HUNTING

FOX (AS *fox*, OHG. *fuhs*, Ger *Fuchs*, fox, Goth *fauho*, vixen, possibly connected ultimately with Skt *puccha*, tail). A member of a group or 'alopeoid series' of canine animals, more easily distinguished from the wolves, dogs, or jackals of the same family (Canidae) by outward appearance than by zoological differences. They are, in general, of smaller size and less proportionate height, have longer hair, usually more reddish or yellowish than gray, larger, more triangular and furry ears, a more slender pointed muzzle, with straighter jaws, and a longer and more bushy tail, than their allies. Some zoologists refuse to separate them even as a genus, but most students place them in the

genus *Vulpes*, and still further separate the American gray fox as *Urocyon*, and the little African long-eared foxes as *Fennecus*. The anatomical characters upon which *Vulpes* is distinctly based are principally found in the skull, where "the bony projection forming the hinder border of the socket of the eye is regularly curved downward and has a convex upper surface" in the wolves and jackals, "whereas in the fox the same process is hollow above and has a more or less marked tendency to curve upward behind", also, the air chambers in the frontal bones of the wolves are absent in the foxes. Another constant distinction is found in the pupil of the eye, which, when contracted, is round in the doglike canines and elliptical in the foxes. The true foxes (apart from the African fennecs) are scattered throughout all the northerly regions of the world, from the edge of the tropical zone to the highest Arctic lands, but none are known in the Southern Hemisphere. The number of species is indeterminate, conservative naturalists regarding as local varieties various forms to which others give specific names.

All inhabit holes in the earth, usually of their own digging, but do not hibernate, are nocturnal, and subsist mainly upon animal prey, which they capture by stealthy approach and a quick rush, and all utter yelping cries, and breed annually. They are believed not to have contributed in any appreciable degree to the ancestry of any race of domesticated dogs, and although everywhere highly intelligent in their field of thought, are rarely tamed as pets or trained to perform tricks well. The typical and best-known species is the European red fox (*Vulpes vulpes*, or *vulgaris*), the hero of British fox hunting (see FOX HUNTING), and the *renard*, or *Reyncke Fuchs* of European folklore. (See Colored Plate of CANIDÆ.) It is spread over the whole of Europe and Asia and is also found in Asia Minor and along the south shore of the Mediterranean. The ordinary type, familiar in Great Britain and western Europe, is reddish brown above and white below, with the outer portions of the ears and feet black, and the tip of the "brush," or tail, white. Its length may vary from 27 to 46 inches, exclusive of the tail, which is itself from 12 to 15 inches long. Colors and markings vary greatly, however, as well as size and proportions. The habits of the common fox in England are thus sketched by Lydekker and Bell, and the essential facts apply to the animal in all parts of its range.

"Although the fox is by no means averse to taking possession of the deserted burrow of a rabbit or a badger, it generally excavates its own 'earth,' in which it spends a considerable portion of its time. As all hunters know, foxes frequently prefer to live out in the woods, those with a northern aspect being, it is said, generally avoided. Sometimes these animals will prefer a thick hedgerow or a dry ditch, while we have known them to select the tall tussocks of coarse grass in swampy meadows as a resting place, and they have also been found in straw ricks, where it is on record that in one instance cubs have been born. The breeding time is in April, and the usual number of young in a litter is from four to six. The prey of the fox consists, writes Bell, 'of hares, rabbits, various kinds of ground birds, particularly partridges, of which it destroys great numbers, and it often makes its way into the farmyard, committing sad havoc

among the poultry. It has been known not infrequently to carry off a young lamb. When other food fails, the fox will, however, have recourse to rats and mice and even to frogs and worms, while on occasion beetles are largely consumed, and on the seashore fish, crabs, and mollusks form a part of its diet. Carrion seems never to come amiss, while the old story of the fox and the grapes alludes to the fruit-eating propensities of these animals. The usual cry of the fox is a yelping bark. The well-known scent of the fox is secreted by a gland situated beneath the tail. The cunning exhibited by English foxes in escaping from hounds has been so often described that we shall make no further allusion to it here, beyond saying that it has probably attained its present development as the result of the inherited experience of many generations. The life of the fox is a precarious one, the huntsman is his friend and the gamekeeper his foe, and were he not specially protected for the sport he gives to hounds and men, he would, like the wolf, have long since been extinct in England. That the fox is an ancient inhabitant of the British Islands is proved by the occurrence of its fossilized remains in caverns in company with those of the mammoth and other extinct animals. This, however, is not all, for a skull . . . has been dug up from the sands lying at the top of the Red Crag of Suffolk, which are vastly older than the mammoth period."

As the Old World fox is traced eastward, distinct local varieties are encountered, which, however, intergrade. Thus, a black-bellied fox is characteristic of southern Europe and is decidedly different from the ordinary colors of the North African variety. The dry plains of western Asia support a paler form, and this is succeeded eastward by two much larger types of the eastern and western Himalayas, which in winter, when the coat is long and the colors are heightened, are extremely handsome, a characteristic marking among these is a dark stripe athwart the shoulders. Siberia, China, and Japan likewise have varieties of this same species, which, if the American red fox be also included, ranges throughout almost the entire Northern Hemisphere and has the most extensive distribution of all the Canidæ. Asia possesses some other very distinct species of foxes, nevertheless, of which the most familiar is the small, alert, and pretty India fox (*Vulpes bengalensis*), to be met with all over Hindustan, except in thickly forested regions. It is rarely hunted by scent, with foxhounds, but frequently affords good sport by coursing with greyhounds. Three other species of "desert" foxes, all pale and yellowish in hue, belong to the open sandy plains and tablelands between Arabia and Afghanistan. One of these is the widely spread desert fox (*Vulpes leucopus*), another, the better-known corsac (qv), and the other varieties inhabit Tibet and Afghanistan. The earliest fossil remains of distinctly canine beasts are foxlike animals of the Middle Tertiary period.

American Foxes. Several species of fox are characteristic of North America. The most widespread and conspicuous is the Eastern red fox, called by American zoologists a distinct species (*Vulpes fulvus*). It differs constantly from the European fox, the colors being, on the average, rather brighter, and it varies on our continent quite as diversely as does the fox of the Old World. The normal red fox remains common in

spite of the civilization of the country throughout the eastern United States and Canada, westward to the Plains, as far south as northern Georgia, and reappears west of the Rocky Mountains and thence to the Pacific coast in a paler large-tailed form. In the far north occur more rarely two other varieties—the cross fox and the silver fox. The former is simply a more or less normal red fox, marked sometimes strongly, sometimes indefinitely, with a dark cross on the back and shoulders, fine specimens of which are given a superior value by traders in peltries. The latter, or silver fox (var *argentata*), is much rarer, and is black, with a silvered or hoary appearance due to many of the hairs being tipped with white, the tail is black with a white tip, and the soles of the feet are hairy, fitting it for life amid ice and snow. Good pelts of the silver fox are extremely valuable. That both these are merely phases of the red fox is plain from the fact that they may be born in the same litter with normally red cubs. Foxes totally black also occur frequently in the Hudson Bay region. The American red fox had originally much the same habits as those of the European animal, seems to be deserving of quite as much credit for sagacity and acuteness, and has learned to accommodate itself as well to the exigencies brought by civilization and the chase. The writings of American naturalists and sportsmen abound in interesting stories of its alertness, ingenuity, and adaptiveness, and show that it has spread and survived in the United States, where the gray fox has diminished.

A small grayer species of the southern California coast (*Vulpes macrotis*) is conspicuously distinguished by its great ears.

The kit, swift, or burrowing fox (*Vulpes velox*) is a well-marked species of the dry plains of the United States, whose range extends from Colorado and Nebraska north to the Saskatchewan valley. It is small, only about 20 inches long, slender and compact in form. Its color is yellowish gray on the upper surfaces, fading through reddish to white on the belly and legs, and there is a black patch on each side of the muzzle. The ears are short and densely furred, and the soles of the feet are overgrown with long woolly hair, like those of the Arctic fox. It digs burrows with skill and speed, feeds upon small rodents, insects, small birds and their eggs, etc., and is remarkably swift of foot and dexterous in hiding. Its fur becomes thick in winter and pale gray in color, rendering it nearly invisible. See Plate of FOXES AND JACKALS.

The blue or Arctic fox (*Vulpes lagopus*) is one of the most interesting of all the species. It is known all around the Arctic shores, and in summer is a variable brown (even sooty in some cases) on the upper parts, and yellowish white on the ventral surfaces, throat, etc., the under fur, however, is everywhere dull blue. This bluish tint frequently appears in the summer dress in patches in the foxes of all regions, but in those of the Aleutian Islands and south-eastern Alaska it characterizes the whole pelage and gives the name "blue" fox to the animal in that region. E. W. Nelson, who describes it at length in his *Natural History of Alaska* (Washington, 1887), concludes that this is the typical, original form, from which the brownish and blackish foxes elsewhere are variants. The blue foxes remain of that color all winter, putting on a longer, thicker coat as cold weather

approaches, but elsewhere all the Arctic foxes become purely white about October and remain so until spring. They are animals of the open country and seacoast, and in winter they often visit the Eskimo villages or come close to their camps and are easily trapped. "Parts of the country," says Nelson, speaking of Alaska, "where rocky ledges occur, are especially frequented by them, as the crevices among the rocks give them welcome shelter. During summer they fare sumptuously upon the breeding waterfowl, eggs, and young birds, which are found everywhere, but in winter comes harder work, and the ground is carefully searched for stray mice, lemmings, or an occasional ptarmigan. In early spring, towards the end of March, when the seals begin to haul up on the ice and the first young are born, thousands of these foxes go out seaward and live upon the ice the rest of the season. The young seal's offal, left by hunters and from other sources, gives them more food there than the shore affords at this time." It may be added to this that Feilden, who was with the Polar expedition of Nares (*A Voyage to the Polar Sea*, London, 1878), found that in Grinnell Land these foxes subsisted in winter largely upon stores of frozen lemmings, etc., which they had hidden in crevices of rocks or had buried in the ground. The fur of this fox is very valuable, and most of all that of blue foxes of the Aleutians, where they are now to a certain extent protected, especially where they have been colonized upon certain islands and are being bred and provided with food. See ALASKA, FUR FARMING, and Colored Plate of CANIDÆ.

The gray fox is a species (*Urocyon agenteus*) of the United States which is generally separated from other foxes by cranial peculiarities and by the fact that the tail has a concealed mane of stiff hairs. The general coat is silver gray above and whitish on the underparts, but the chin and a patch on the nose are black, and the base of ears, patch at side of neck, collar on throat, interior surface of forelegs, and a broad band along the belly are cinnamon rufous. The size is about the same as that of the red fox, but the hair is stiffer and less admirable as a pelt. This species is generally distributed over the United States, but in the West differs locally so much from the Eastern type that five or more subspecies have been named. It is accustomed to life in the forests rather than in open country and has unusual ability in tree climbing, but it seems to be less adaptive than the red fox and has almost disappeared from the thickly settled and much-cleared Northern and Eastern States. See Plate of FOXES AND JACKALS.

Animals (New York, 1909), and general works upon Alaska and the Arctic coast.

FOX, or MUSKWAKI, müs-kwa'ki. An Algonquian people, best known as confederates of the Sauk (qv). They were called foxes (*Renards*) by the French, possibly because of having a Fox clan, but call themselves Muskwakiuk, 'red-earth people'. When first known, they lived in central Wisconsin, having been driven from Lake Superior by the Ojibwa, whose continued inroads, together with a disastrous war with the French, finally compelled them to incorporate about 1760 with the Sauk, with whom they have ever since been so intimately connected that the two tribes are now practically one. They constitute one of the central Algonquian tribes and belong to the woodland type of culture. They lived in bark houses, raised some corn and vegetables, had a rather complex social organization, and are now extremely conservative in the adoption of civilized customs. The Sauk Fox now number 724. Consult M. A. Owen, *Folk-lore of the Muskwaki Indians of North America* (London, 1904), and *Handbook of American Indians* (Washington, 1907).

FOX, CAROLINE (1819-71). An English diarist, born at Falmouth, of a Quaker family that for two centuries had been prominently identified with Cornwall. Her father, Robert Were Fox, the inventor of the deflector dipping needle, by his genial qualities drew around him many famous persons of his day, among them John Stuart Mill, John Sterling, and Thomas Carlyle. Miss Fox has graphically sketched their characters and conversations in her posthumously published *Memories of Old Friends, Being Extracts from the Journals and Letters of Caroline Fox*, ed. by H. N. Pym (London, 1882). Especially interesting are the accounts of the conversations between Mill and her brother, Barclay Fox.

FOX, SIR CHARLES (1810-74). An English engineer. He was born at Derby and, after serving as apprentice to Captain Ericsson, entered the service of Robert Stephenson. He was subsequently a member of the firm of Fox, Henderson & Co., and after 1857 confined himself to private practice as consulting engineer. Besides his extensive railway and bridge work in Great Britain, he built a bridge over the Saône at Lyons and constructed railroads in Denmark, France, Switzerland, Canada, South Africa, and India, where he introduced the narrow gauge. The introduction of the switch in place of the sliding rail previously in use is also credited to him.

FOX, CHARLES JAMES (1749-1806). A celebrated English statesman and orator. He was the son of Henry Fox, first Lord Holland, and Lady Caroline Lennox, who was the eldest daughter of the Duke of Richmond and the great-granddaughter of Charles II. He was born in Westminster, on Jan. 24, 1749, was educated at Eton and at Hertford College, Oxford, and afterward traveled for two years on the Continent.

On his return to England in 1768, although he was not yet of age, his father procured him a seat in Parliament by a purchase of the pocket borough of Midhurst. His talent as a debater won him a place in Lord North's ministry, which he entered in 1770 as Junior Lord of the Admiralty. In December, 1772, he was made Lord of the Treasury, but was dismissed

in February, 1774, because of his opposition to the King's favorite marriage bill and a useless humiliation inflicted upon Lord North. The years that followed may be described as a conflict between the King, through his Minister, Lord North, and the brilliant Fox. He was the most formidable opponent of the war with America, even foreseeing the necessity and advantages of a complete separation. On the downfall of Lord North in 1782, notwithstanding the King's opposition, he was made Foreign Secretary in the Whig ministry of Rockingham. He supported Pitt's motion for parliamentary reform and granted to Ireland complete legislative independence. His masterful plan for the separation of French and American interests in the peace negotiations of Paris was circumvented by Shelburne, the Home Secretary. As a consequence he resigned his office when Shelburne became Premier on the death of Rockingham. Forming a coalition with Lord North and the Tories, he defeated Shelburne and resumed his old position as Foreign Secretary, but the personal influence of the King secured the rejection by the Lords of his India bill, which vested the government of India in a commission appointed by Parliament.

What may be called the second period of the parliamentary career of Fox was occupied by his long struggle with Pitt. He alone, of all the famous English statesmen of his day, favored the French Revolution and was opposed to the ruinous wars with France. The total abolition of the slave trade, the removal of the political disabilities of both the Dissenters and the Catholics, were repeatedly urged by him. He gave powerful aid in the impeachment of Warren Hastings, and in 1792 he secured the passage of his Libel Act, which as a measure for personal liberty is second only to the Habeas Corpus Act in importance. When Pitt died (1806), Fox became Foreign Secretary in the Ministry of All the Talents, but he did not live to see either the slave trade abolished or his peace negotiations with France carried out. He died in his fifty-eighth year, on Sept. 13, 1806.

Fox was better qualified to lead an opposition than to govern an empire, for he lacked the tact and self-restraint necessary for managing parliamentary majorities and conciliating a headstrong King. He was one of the most brilliant and interesting figures of the eighteenth century. He had the vices of his day, but these were counterbalanced by his unfailing honesty and genial and kindly disposition. His vices he owed in a large measure to his father, a notoriously corrupt politician who deliberately made of him a gamester. He did not allow the faults of his private life to interfere with the strict performance of his parliamentary duties, and whenever he was in office he relinquished them altogether. He was a man of fine literary taste, and among his friends were the poet Rogers, Gibbon the historian, and Dr. Johnson. Of his own literary efforts, the most important was a *History of the Reign of James II* (1808), left incomplete at the time of his death. The work is of little value from either a scientific or a literary standpoint.

Consult: Wright, *Speeches of the Rt Hon Charles J. Fox in the House of Commons* (London, 1815), *Memorials and Correspondence of Charles James Fox*, ed. by Lord John Russell (1b, 1853), being materials collected by Lord Holland, his favorite nephew, Lord John Russell,

The Life of C. J. Fox (1b, 1859-66), Walpole, *Recollections of the Life of Fox* (1b, 1806), Trevelyan, *Early History of Charles James Fox* (New York, 1881), Wakeman, *Life of Charles James Fox* (London, 1890), in the "Statesman Series", Lecky, *History of England in the Eighteenth Century*, vols. III-VI (1b, 1882-87), Hammond, *Charles James Fox: A Political Study* (1b, 1903), Landor, *Charles James Fox: A Commentary on his Life and Character* (New York, 1907), and *George III and Charles Fox* (1b, 1912).

FOX, EDWARD, BISHOP OF HEREFORD (c. 1496-1538). An English ecclesiastic, born at Dursley, Gloucestershire, and educated at Eton and at King's College, Cambridge. He became secretary to Wolsey, who sent him as an envoy to Rome (1528) for papal sanction to Henry VIII's first marriage. Brought thus into royal notice, Fox was sent upon numerous diplomatic errands to France and elsewhere and rose rapidly till he became Bishop of Hereford (1535). He was the main mover in Henry's divorce of Catharine and marriage with Anne Boleyn and was active in securing the favorable opinion of the universities on this point. He was a pillar of the Lutheran faith. In 1535-36 he was in Germany on a political and theological mission. The Ten Articles of 1536 were largely his work. He is credited with the epigram, "The surest way to peace is a constant preparedness for war." His most important work is *De Vera Differentia Regiæ Potestatis et Ecclesiæ* (1534), of which an English translation was made in 1548. Consult Lloyd, *State Worthies* (London, 1679), and Brewer and Gardner, *The Reign of Henry VIII* (2 vols., 1b, 1884).

FOX, GEORGE (1624-91). The founder of the Society of Friends, or Quakers. He was born at Fenny-Drayton, Leicestershire, July, 1624. His parents were in good circumstances, but it is doubtful if he had any schooling. He was apprenticed to a shoemaker, but when about 19 came to believe himself the subject of a special divine call and took to wandering in solitude through the country, absorbed in religious reveries. His friends induced him to return home; but he stayed only a short time, and finally adopted the career of an itinerant religious reformer. About 1646 he left off attending church for worship. In the same year he began preaching in Mansfield, Leicester, and other places, always under the feeling of a direct command of God. He first attracted general attention in 1649, by rising in the principal church at Nottingham during the sermon and rebuking the preacher for declaring the authority of the Scriptures to be the source of divine truth. "No," cried Fox, "it is not the Scriptures, it is the Spirit of God." This audacious act led to his immediate imprisonment. On his release he repeated his protests elsewhere. The excitement caused was very great, and Fox was frequently imprisoned as a disturber of the peace. He gained followers, who first received the name "Quakers" in 1650. According to Fox's *Journal*, it was given by Justice Bennet, of Derby, because Fox had bidden the magistrates to "tremble at the word of the Lord." In 1655 he was examined in London before Cromwell, who pronounced his doctrines and character irreproachable. Nevertheless he had a hard struggle, was constantly vilified, and frequently imprisoned by country magistrates. His followers increased in large numbers. They

were naturally visionaries, mystics, and fanatics and their extravagances did much to bring the body and its founder into discredit. It is no small item in Fox's favor that he, though himself subject to visions, succeeded in moderating their excesses and introducing discipline and organization among them. He had much help from Margaret, widow of Judge Fell, of Swarthmoor Hall, Lancashire, whose house became the headquarters of the Quaker movement. Although she was 10 years older than Fox, they were married in 1669. Fox traveled unemittingly, preaching his doctrines. In 1671-72 he visited the West Indies and the continent of North America, and twice he went to Holland. Of his many imprisonments the longest was at Lancaster and Scarborough, in 1663-66, and the last in Worcester jail, for nearly 14 months, in 1673-74. He died in London, Jan. 13, 1691. Fox was not a man of broad and philosophic genius, and his writings are marked by a direct simplicity, void of the graces of style. He won his success by earnestness and persistence, and the simplicity of his teachings, continually insisting upon a few leading doctrines, such as the futility of learning for the work of the ministry, the presence of Christ in the heart as the "inner light," the necessity of trying opinions and religions by the Holy Spirit, and not by the Scriptures, and the doctrine of "nonresistance." He was a man of winning personal manners and strong and sound moral nature. He often showed great shrewdness in his dealings with magistrates. His peculiarities of dress have been exaggerated and were adopted from a desire for simplicity rather than eccentricity. The fullest collection of his writings is the Philadelphia edition (8 vols, 1831). The best known is his *Journal* (1634, new ed, 1902, abridged, London, 1903). Consult Tallack, *George Fox, the Friends, and the Early Baptists* (London, 1868), Bickley, *George Fox and the Early Quakers* (ib, 1884), Smith, *Descriptive Catalogue of Friends' Books* (ib, 1867), Beck, Wells, and Chalkley, *Biographical Catalogue* (ib, 1888). There are many biographies, among which those of Jenney (Philadelphia, 1833), Hodgkin (London, 1897), and Wood (ib, 1912) may be mentioned. See FRIENDS.

FOX, GEORGE L (1825-77). An American comedian, born in Boston. He made his first appearance at the Tremont Street Theatre in that city at the age of five. In New York, where he played for some time (after 1850) at the National Theatre in Chatham Street, he became popular as a low comedian. In the Civil War he was a lieutenant in the Eighth New York Infantry. Inspired by the famous Ravel Brothers to undertake pantomime, he created a distinct place for that kind of entertainment in New York City, first at the National Theatre and later at the New Bowery, of which he was for a time lessee and manager. His principal role was the clown in *Humpty Dumpty*, and no one has ever equaled him in this character. He was scarcely less distinguished in his burlesques on famous tragedians of the day, especially Booth in the character of Hamlet. Consult *George Fox: An Autobiography* (2 vols, Philadelphia, 1904).

FOX, GUSTAVUS VASA (1821-83). An American naval officer. He was born in Saugus, Mass., entered the United States navy as a midshipman in 1838, participated in the war with Mexico, and retired with the rank of a lieutenant

in 1856. He was in the wool-manufacturing business at Lawrence, Mass., from 1856 to 1861. Early in 1861 he was consulted by General Scott in regard to a relief expedition to Fort Sumter, but President Buchanan refused to allow the plan to be carried out. After the inauguration of Lincoln, Fox was first sent to confer with Major Anderson and upon his return was commissioned to fit out a relief expedition at New York. Fox, with part of his ships, arrived off Charleston harbor on the morning of the bombardment, but through an order which had detached the principal vessel of his fleet and sent it to Fort Pickens, he was unable to render aid. After his return North, Fox served as Assistant Secretary of the Navy throughout the war. He planned the opening of the Mississippi, the capture of New Orleans, and the selection of Farragut for high command. In 1866 he was sent to Russia on a special congratulatory mission to the Czar, Alexander II, who had just escaped assassination, and he took part in the negotiations for the purchase of Alaska. Upon his return to America he again entered the wool-manufacturing business at Lowell. Consult Loubat, *Narrative of Fox's Mission to Russia in 1866* (New York, 1873).

FOX, HENRY, BARON HOLLAND (1705-74). See HOLLAND, HENRY FOX.

FOX, HENRY EDWARD (1755-1811). An English soldier, the younger brother of Charles James Fox. He studied at Westminster School and entered the King's Dragoons in 1770. Three years later he was made lieutenant of the Thirty-eighth, quartered in Boston. He served at Concord, Bunker Hill, Long Island, White Plains, Brandywine, and Philadelphia, and in 1777 was made major and a year later lieutenant colonel of the Forty-ninth Regiment, and saw service in the West Indies. In 1783 he returned to England and was made aid-de-camp by the King, who took a great fancy to him. Major general in 1793, he commanded a brigade at Roubaix and Mouveaux and at Pont-a-Chin (1794) beat back a French army. In 1801 he was sent to Minorca and stayed there until 1803, when he went to Ireland as commander in chief and was badly frightened by the feeble rebellion under Emmet. In the next year he was made Lieutenant Governor and actual commander of Gibraltar, and in 1806, on the accession of the Ministry of All the Talents, was appointed Ambassador to Naples and commander of the forces in Sicily, but he accomplished little there, quarreling with the Neapolitan court and being unwilling to risk all in an attempt to drive the French out immediately. In 1807 he was recalled by the new ministry, after his brother's death, and subsequently was made general (1808) and Governor of Portsmouth (1811). He married Marianne Clayton (1786) and had two daughters and one son, Henry Stephen (1791-1846), who was Minister to the United States (1835) and did much to promote the success of the Ashburton Treaty.

FOX, JOHN. See FOXE, JOHN.

FOX, JOHN (WILLIAM), JR (1863-1919). An American novelist. He was born in Bourbon Co., Ky., in 1863, and graduated from Harvard in 1883. After some experience in journalism he traveled in Southern States and California and afterward engaged in business at Cumberland Gap, where he had ample opportunity for the study of mountain life. He wrote *A Mountain Europa* (1894), *A Cumberland Vendetta*

(1895), *The Kentuckians* (1897), *Crittenden* (1900), a novel of the Cuban War, *The Little Shepherd of Kingdom Come* (1903), *Christmas Eve on Lonesome, and Other Stories* (1904), *Hell for Sartain, and Other Stories* (1897), *Blue Grass and the Rhododendron* (1901), *Following the Sun Flag* (1905), *The Knight of the Cumberland* (1906, 1913), *The Trail of the Lonesome Pine* (1908), *The Heart of the Hills* (1913)

FOX, LUKE (1886-1935) An English navigator. He was born at Hull and went to sea at an early age. On April 30, 1831 he sailed from London to search for a northwest passage. The results of his explorations were subsequently embodied in the work entitled *Northwest Fox, or, Fox from the Northwest Passage* (1835, in Hakluyt Society Publications, with notes by Christy, 1894), which contained a most interesting map of the Arctic regions. He made an extensive exploration of the western shore of what is now called Baffin Land, and discovered Cumberland Island and other points along Hudson Strait. The far northern channel through which he passed was named after him.

FOX, MARGARET (1836-93) An American spiritualist, born at Bath, Canada. At Hydeville, Wayne Co., N. Y., about 1848 (and afterward at Rochester), there were heard in the Fox residence rapping noises which appeared to proceed from the walls and furniture. Margaret and her two sisters, Catharine and Leah, discovered that by means of a given code communication could be established with the presumably supernatural agency by which the raps were produced. The sisters gave public sances in America and Europe, the chief features of which were the spirit rappings and the moving of large bodies by invisible means. So-called "mediums" became numerous, and the investigation of spiritualistic phenomena interested many. From the first, however, scientific minds discredited the claims of the sisters. In 1888 Margaret made a confession of imposture, later retracted. She claimed that she was the wife of Dr. Elisha Kent Kane, who tried to persuade her to give up her sances, and whose correspondence with her she published in *The Love-Life of Dr. Kane* (1866). See SPIRITUALISM.

FOX, RICHARD See FOXE

FOX, THE See VOLTONE

FOX, SIR WILLIAM (1812-93) A New Zealand statesman. He was born at Westoe, Durham, England, and graduated from Wadham College, Oxford, in 1832. In 1842 he went to New Zealand as agent of the New Zealand Company for the South Island, in 1850 he returned to London to present the claims of the colonists for self-government, but was unsuccessful at this time. The purpose was ultimately accomplished, however, and Fox was a number of times Premier—for periods varying from 13 days to three years—in 1856, 1861, 1863, 1869-72, and 1873, in 1879 he had a seat in the New Zealand Parliament. He brought about a lasting peace with the native tribes, the Maoris, and was active on behalf of temperance. His writings include *The Six Colonies of New Zealand* (1851), *The War in New Zealand* (1860), *How New Zealand Got its Constitution* (1890).

FOX, WILLIAM JOHNSON (1786-1864) An English Unitarian preacher, orator, and political writer. The son of a peasant farmer, he was born at Uggeshall Farm, Wrentham, Suffolk, March 1, 1786. His father removed to Norwich,

where he pursued various callings, and Fox, after primary education at a chapel school and working as an errand boy and weaver's help, became a banker's clerk. He devoted his leisure to self-improvement in arts and languages and in 1806 was sent to Hometon Independent College for ministerial training. Subsequently, in 1812, he seceded to Unitarianism, and in a London charge became celebrated as a rhetorician and the most eloquent exponent of English rationalism. An unfortunate marriage and separation led to his resignation from the ministry, and he devoted himself to literature and public speaking. In the interests of free trade and the Anti-Corn Law League he thrilled enthusiastic popular audiences with his oratory. From 1847 to 1863 he represented Oldham in Parliament as an advanced Liberal. His speeches in that critical assembly did not equal the success of his platform orations, but he soon acquired general respect by his tact and discretion. His best parliamentary addresses were in favor of public education and the extension of the franchise, and he was the first to introduce into the House of Commons a bill for national secular education. He was the first contributor to the *Westminster Review*, he was editor and proprietor of the *Monthly Repository* for many years, and he contributed copiously to other organs of public opinion. His *Lectures of a Norwich Weaver Boy* and *Lectures to the Working Classes* had an extensive and popular circulation and did much to effect the reforms they advocated. *Religious Ideas* is his most important theological work. His voluminous writings, sermons, and orations are collected in the memorial edition of his works (London, 1865-68). He died June 3, 1864. Consult Garnett, *The Life of W. J. Fox* (London, 1910).

FOX BAT Any large fruit-eating bat, or "flying fox," of the family Pteropodidae, esteemed the lowest in rank of the Chiroptera. There are some 70 species, inhabiting Africa, India, China, Japan, and the Malay Archipelago, where they especially abound. Most are of large size, are tailless, have small, pointed ears, large eyes, noses free of lobes, and those of the type genus much resemble in physiognomy, size, and color the foxes after which they are named. A Javan species spreads its wings 5 feet. It is eaten by the natives. These bats are wholly frugivorous, nocturnal, gregarious, and do great damage where numerous, especially to coconut and mango plantations. A strong musky odor pervades, at night, the vicinity of their assemblies, and one credible writer asserts that the flying foxes are fond of drinking palm toddy from the chatties left out overnight. An African genus of this family supplies the common Egyptian bat, which flocks in the chambers of the pyramids and other tombs and is figured on the monuments, it is *Xantharpha aegyptiaca*. An Austro-Malayan genus is termed *Harpia*, in reference to the supposition that a bat of this sort is the basis for the harpies of classic mythology. Consult Wallace, *Malay Archipelago* (New York, 1898). See FRUIT BAT.

FOXBOROUGH A town in Norfolk Co., Mass., 24 miles southwest of Boston, on the New York, New Haven, and Hartford Railroad and on the Neponset River (Map. Massachusetts, E 4). It contains the Boyden Public Library. The chief industry is the manufacture of straw hats, and there are also automobile-tire works and steam-gauge and spark-plug factories. The

water works are owned by the town. Pop, 1900, 3266, 1910, 3863

FOX CHANNEL. A northern reach of Hudson Bay, Canada, inclosed on the west by Southampton Island and Melville Peninsula, and on the east by Fox Land and Baffin Land (Map Canada, P 3) It has a southeast outlet through Hudson Strait and a northwest outlet through Fury and Hecla Strait It was named after Luke Fox, who explored Hudson Bay in 1631

FOX DEITY AND FOX POSSESSIONS

In Chinese Asia popular belief ascribes to the fox extraordinary powers and the ability to assume human or any shape, but generally that of beautiful women, and to work all kinds of mischief, especially in love affairs Possession by the spirit of a fox is so thoroughly believed in that a standard source of revenue for Buddhist priests of certain sects is in practicing exorcism from their suffering patients, usually women The foxes in their various transformations appear to the good or evil with rewards or punishments in quite the orthodox story-book style In Japan the fox is the attendant on the food god, Inari (Rice bearer, or Rice man), and myriads of effigies of the creature in white or colored material, usually stone, may be seen near the Inari shrines Giles tells us that "in some parts of China it is customary for mandarins to keep their seals of office in what is called a fox chamber", but the character for fox is never written, the sight of it being supposed to be very irritating to the live animal A character which has the same sound is substituted, and even that is divided into its component parts, so as to avoid the slightest risk of offense This device is often adopted for the inscriptions on shrines erected in honor of the fox" Consult Pfounds, *Fu-So Mami Bukoro* (Yokohama, 1875), Mitford, *Tales of Old Japan* (London, 1876), Chamberlain, *Things Japanese* (ib., 1892), Griffis, *The Mikado's Empire* (11th ed., 2 vols, New York, 1906), Smith, *Ancient Tales and Folklore of Japan* (London, 1908), Griffis, *China's Story in Myth, Legend, Art, and Animals* (ib., 1911), Davis, *Myths and Legends of Japan* (New York, 1912)

FOX DOG. A book name for a group of small South American canine animals on account of their somewhat foxlike aspect The group was defined by Mivart, *Proceedings of the Zoological Society of London* (London, 1890), as including five species, as follows

Crab-eating fox dog (*Canis cancrivorus*), Brazil

Short-eared fox dog (*Canis microtis*), Brazil
Azara's fox dog (*Canis azarae*), Brazil to Tierra del Fuego

Small-toothed fox dog (*Canis parvidens*)

Black-tailed fox dog (*Canis urostratus*), Brazil

These animals are much alike in their foxy appearance, though rather larger in size, and having a more variegated and highly variable coat, often handsomely marked with black and dark red, than any true fox The crab-eating fox dog is common throughout the forested parts of the whole Amazon basin and gets its name from its fondness for crayfish, though these crustaceans form only a part of its fare They often collect in packs and run down deer Azara's dog (see Plate of WOLVES AND WILD DOGS) is known throughout the whole continent east of the Andes, on the pampas and bleak shores of Patagonia (where it is called colpeo).

as well as in the forests of Brazil and Guiana It has much the habits of the North American coyote, but resorts to jungles and forests much more readily Everywhere it is foxlike in its fondness for poultry, and in Paraguay it is said to destroy a great amount of sugar cane while eating only a little The small-toothed species takes its name from the diminutive size of the fourth premolar, and of the short-eared dog almost nothing is known Consult Hudson, *The Naturalist on the La Plata* (London, 1903)

FOXES, JOHN (1516-87) The English martyrologist He was born in 1516 at Boston, Lincolnshire In 1523 he entered as a student at Oxford, in 1537 he took his bachelor's and in 1543 his master's degree, and was elected a full fellow of Magdalen College (1539) He displayed at an early period an inclination for Latin poetry and wrote several plays in that language upon scriptural subjects Of these, the only one that remains, entitled *De Christo Triumphante*, was first printed at Basel in 1556 The religious movements of the times led him to study the great controversy between the Old Church and Protestantism, and, becoming a convert to the principles of the Reformation, on July 22, 1545, he resigned his fellowship In 1546 he married, and, coming to London for employment, he attracted the notice of the Duchess of Richmond, and through her influence became tutor (1548) to the children of her brother, the Earl of Surrey, who had been executed in 1547 On June 23, 1550, he was ordained deacon by Ridley, Bishop of London, and preached the doctrines of the Reformation at Reigate In 1553, when Mary came to the throne, he was dismissed by the Catholic grandfather of his pupils, and, fearing persecution for his religious opinions, he fled to the Continent On the accession of Elizabeth he returned to England in October, 1559, was ordained priest, 1560, and in May, 1563, was made a prebendary in Salisbury Cathedral and vicar of Shipton He also held the living of Cripplegate, which he soon resigned, and for a year (1572-73) he held a stall at Durham In 1575, when some Dutch Anabaptists were condemned to the flames in London, Foxe interceded for them with Elizabeth and other persons in authority, but without effect He wrote numerous controversial and other works, but the one that has immortalized his name is his *History of the Acts and Monuments of the Church*, popularly known as *Foxe's Book of Martyrs*, the first draft of which was published at Strassburg in 1554 The first English edition appeared in 1563 A later edition, with certain errors corrected, was ordered, by a canon of the Anglican convocation, to be placed in every cathedral church in England It is not a critical work, as might be supposed, and Roman Catholics deny its trustworthiness, but it was very popular and has been often reprinted The best editions are by Cattle, with introduction by Townsend (London, 1843-49), Mendham and Pratt (8 vols, ib., 1853), by Stoughton (ib., 1877), and by Berry (New York, 1907) Foxe died in London, April, 1587, and was buried in the chancel of St Giles's, Cripplegate, London There is no satisfactory life of Foxe, the first issued (1641) was very unreliable, the nearest approach to correctness is that revised by Pratt (London, 1870) Consult *Dictionary of National Biography*, vol xx (ib., 1889)

FOXES, or FOX, RICHARD (c 1448-1528). An English prelate and statesman, born at Ropesley,

Lincolnshire, and educated at Oxford (probably Magdalen College), and possibly at Cambridge. In Paris he made the acquaintance of Henry of Richmond, and helped him get money and men from the French King for his invasion of England. After the accession of Henry VII Foxe was one of the King's most trusted advisers and became Secretary of State, Privy Seal, and Bishop of Exeter (1487), of Durham (1494), and of Winchester (1501). He was sent to Scotland as Ambassador several times, negotiated a treaty between England and Scotland in 1487, and again in 1497, after a stout defense of his castle in Durham. In the interval he had been a signer of the Treaty of Etaples (1492) and commissioner on the *Intercursus Magnus*, a treaty with Philip of Austria (1496). In 1498 and 1499 he treated with the Scottish King and made arrangements for his marriage with the Princess Margaret. In the following year he was chosen chancellor of Cambridge and was master of Pembroke (1507-19). Under Henry VIII his influence gradually diminished. He retired from the court in 1516 and became blind a few years after. But his last years were spent well, he founded free schools at Taunton and Grantham, and at Oxford, Corpus Christi College (1516), which became a home for the new learning. Foxe may have had a share in the writing of *Contemplacyon of Synners* (1499). He edited a *Processional* (1508) and translated the *Rule of Saint Benedict* (1517). Consult Cassan, *Lives of the Bishops of Winchester* (2 vols London, 1827), and Ward, *The Life of Bishop Fox* (Oxford, 1843).

FOXGLOVE
(*Digitalis Purpurea*)

FOX'GLOVE The very inappropriate name of a genus (*Digitalis*) of about 18 species of beautiful half-hardy herbaceous biennial plants

of the family Scrophulariaceæ. The erect stems, which bear numerous large leaves at their bases, terminate in long racemes of inflated campanulate flowers, of various colors and markings. Individually foxgloves are attractive, and in masses they give character to the flower border. They succeed well in light, rich soil, not too dry, in either exposed light or in partial shade. When once established, they will reproduce sufficient plants from seed to keep the border stocked. One species, credited with diuretic, sedative, and narcotic properties, is officially listed in dispensaries under the name *Digitalis* (qv).

FOX'HOUND'. A small hound, trained to pursuit of the fox. See HOUND, FOX HUNTING.

FOX HUNTING. There are various fashions of hunting the fox. In England, the home of fox hunting, and where it was practiced with specially trained dogs as early as 1750, the animal is pursued by carefully bred packs of hounds ranging in number from 25 to 40 couples, which are put by the huntsmen into a covert or wood where it is known or thought the fox has his earth. He would elude the hounds almost invariably were it not for the scent left in the air along his track. One or another hound is sure to come across the scent and give tongue, so that the remainder of the pack quickly follow. They break cover and are joined outside by the horsemen who follow the chase. The fox will, as a rule, go down wind and make straight for some spot where he can baffle the hounds by getting under cover or into an earth where they cannot follow him. Some hunters believe that a fox will deliberately employ ruses of various kinds to throw the hounds off the scent. Sometimes, in England, he arrives at his earth only to find that it has been filled up by the "stopper," and he has to make off on another venture. Sometimes he is killed in the open.

The kenneling and maintenance of hounds and huntsmen and the establishments kept up in the most favored neighborhoods necessitate an immense expenditure annually. The most important hunts in England are the Belvoir Castle, the Quorn, the Pytchley, and the Cottesmores. Leicestershire also is a favorite hunting county, but the sport is practically general throughout England and in a lesser degree in Ireland. In America the Virginian colonists early followed the English method of fox hunting, with the difference only that the pack was made up by each gentleman bringing his own hounds with him. The sport was common in the Southern States up to the time of the Civil War, and there are still sections where it is conducted much as in the old days. In Maryland the English foxhound was crossed with the Irish staghound to give him the necessary endurance for more difficult conditions, and the records of fox hunting in Queen Anne County go back to 1650. Dissatisfied with the gray native fox, the colonists in 1738 imported red foxes and let them loose along the shores of the Chesapeake. They multiplied rapidly, and the Baltimore Hounds, established in 1818, have always been among the most famous in the South. The English pack has been discarded, and the Magnes strain, a distinctly Maryland dog, adopted by the Elkridge Club, the most prominent in Maryland. Pennsylvania had the first organization, the Gloucester Fox-Hunting Club, established in 1766. The American hound is faster and better than the English dog and peculiar

early well adapted for his work. In America a "kill" is an exception with the average hunt "Earth," as the holes in the ground are called, are never "stopped" or closed, as in an English fox-hunting country, and it is very rarely that an attempt is made to dig out a fox who has taken refuge in one. Particularly is this true where the fox has made a straight, true race. Occasionally it happens that a fox becomes known and is given a name, owing to the frequent sport he has afforded the hunt and his exceptional skill in making his escape.

Where foxes are not found, or it is desirable to spare the cubs, drag hunting is a favorite sport as well as an excellent training for young horses, dogs, or riders. A course from point to point is mapped out, and a good rider, well mounted, is sent over it dragging on the ground as he goes a bag of aniseed or a red herring. The hounds are cast off and pick up the scent with as much avidity and certainty as if it were that of a fox. The riders follow the hounds on horseback, and if the pace of the hounds is good, and the course suitable, a very effective and exhilarating ride is the result. The chronicles of drag hunting go back to the reign of Charles II, farther back in fact than the existence of any of the great foxhound packs to-day, and its practice has continued ever since. See HORSE, HORSEMANSHIP, HUNTING. Consult Paget, *Hunting* (London, 1900), Somerville, *Slipper's ABC of Fox Hunting* (ib., 1903), Higginson and Chamberlain, *Hunts of the United States and Canada* (Boston, 1908), Vyner, *Notitia Venatica*, rev. ed. by Blew and Bradley (2 vols., London, 1910), Radcliffe and Blew, *Noble Science* (2 vols., New York, 1912), and the elaborate article under "Hunting," in *The Encyclopædia of Sports and Games*, ed. by the Earl of Suffolk and Berkshire (London, 1911).

Fox Hunting, in law. As one of the national sports of Great Britain, fox hunting is the subject not only of social usages, but of legal rules. Persons who kill foxes by traps or guns are visited with social ostracism, while those who hunt them with horses and hounds are exempted by statute from penalties for trespass within lands of others in certain cases. A master of hounds, as well as one who follows hounds in fox hunting, is generally answerable civilly, however, for damage done to the property of others. A fox is not the subject of absolute ownership until killed or reduced into possession, and therefore not the subject of larceny. A person may acquire a qualified property, however, in tame foxes, and for injuries done by such animals he should be held liable, as for those inflicted by other *fera naturæ* (qv).

Until recently the legal status of the fox in the United States has been that of a noxious wild animal, liable to killing at sight by trap, gun, or dog. With the introduction of fox breeding and fox hunting upon large private estates has come a change in legal policy, and statutes have been enacted prohibiting the killing of foxes during certain months. Laws against cruelty to animals have been invoked to prevent the hunting of captive foxes by dogs. Consult *Commonwealth v. Turner* (145 Mass. 296, 1887); *New York Session Laws* (1901, chap. 559), Oke, *Handy Book of the Game Laws* (London, 1897).

FOX ISLANDS. Another name for the

Aleutian Islands (qv) in general and specifically for the easternmost group.

FOX RIVER. A river of Wisconsin, rising in the southern part of the State, in Green Lake County (Map Wisconsin, E 4). It flows first in a southwesterly direction to within a few miles of the town of Portage, on the Wisconsin River, with which it is connected by a ship canal. From this point the Fox flows nearly due north to Lake Buffalo in Marquette County, whence its course is generally northeast to its confluence with the Wolf River, whose southeasterly direction it follows for about 8 miles to Oshkosh, where it empties into Lake Winnebago. As the outlet of that lake it flows northward and empties into Green Bay, an arm of Lake Michigan. It is navigable for a considerable part of its course and, through the medium of the canal connecting it with the Wisconsin, forms a link between the navigation systems of the Mississippi and the Great Lakes. The lower part of the Fox is marked by numerous rapids, furnishing great water power. Its total length is over 250 miles.

FOX SHARK. See THRESHER SHARK.

FOX SNAKE (so called from its color). An American harmless snake (*Coleuber vulpinus*) inhabiting only the northern part of the Mississippi valley. It reaches 6 feet in length, is robust, and, although harmless, is easily irritated, and then shows more pugnacity and courage than almost any other of its tribe. It feeds altogether upon small mammals, up to the size of a half-grown rabbit, and does farmers much service by killing great numbers of mice. Its color above is light brown, blotched on the back with chocolate, each blotch covering a space three or four scales long and bordered with black. Smaller and rounder blotches mark the sides and yellowish abdomen. It is locally known also, as the pilot snake, very likely by vague confusion with the copperhead. Consult Hay, *Seventeenth Annual Report, State Geologist of Indiana* (Indianapolis, 1892), and Ditmars, *The Reptile Book* (New York, 1907).

FOX SPARROW (so called on account of its color). One of the largest and handsomest of North American sparrows (*Passerella iliaca*), distinguished by the rust red of its plumage, purest and brightest on the rump, tail, and wings, and elsewhere on the upper parts appearing as streaks on an ashy ground, below it is white thickly marked with rust red. It is a migrant, passing to northern Canada to breed, and uttering on its passage in early spring a loud and sprightly song, more like that of a thrush than a sparrow. It makes its nest on the ground, in the protection of thickets, and lays thickly spotted eggs. In the Eastern United States and Canada only one form of fox sparrow (*Passerella iliaca*) is found, but in the mountainous regions of California and other parts of the Pacific coast seven additional subspecies have been differentiated.

FOX SQUIRREL (so called on account of its color). The large rufous squirrel of the Mississippi valley. See SQUIRREL.

FOX/TAI' GRASS. A name applied to two very dissimilar grasses of the genera *Alopecurus* and *Setaria*. They bear a general resemblance to timothy, with which they are closely related. The species of *Alopecurus*, which number about 20, are natives of temperate countries of both the Northern and Southern hemispheres, and several are American. Meadow foxtail

grass (*Alopecurus pratensis*), which has an erect smooth culm about $1\frac{1}{2}$ to $2\frac{1}{2}$ feet high, and a cylindrical, obtuse, spikelike panicle abundantly covered with silvery hairs, is one of the best meadow and pasture grasses in Europe and introduced into America. It does not arrive at full perfection till the third year after it is sown. It bears mowing well and upon good soils yields a large crop and is reckoned a good grass for lawns. It is very hardy and bears drought well. The jointed foxtail, or water foxtail (*Alopecurus geniculatus*), with an ascending culm bent at the joints, is very common in moist places, and cattle are fond of it, but it is a small grass, growing but a foot or two high. The slender foxtail grass (*Alopecurus agrestis*) is a short-lived perennial of little value except for light sandy soils, on which it is sometimes sown. *Alopecurus occidentalis* is a native of the United States and would doubtless prove valuable under cultivation in the Rocky Mountain region and elsewhere. These grasses are all valuable, but should be sown in mixtures.

The other class of foxtail grass belongs to the genus *Setaria*. Other generic names have been given them, but this name is given the preference under international botanical rules. They are mostly considered as weeds and are more or less troublesome, although when young they are eaten by stock, and the seeds of some are gathered. There are about 35 species, some of them exceedingly valuable. They are distributed throughout all warmer and temperate regions. The Hungarian grass or millet (*Setaria italica*), with its varieties, some of which are the German millet, golden millet, etc., is extensively cultivated for its forage and seed. The latter is employed as human food in some countries, as in India, Russia, etc. The giant millet (*Setaria magna*) grows in wet places from Delaware to Florida. The common species, yellow foxtail (*Setaria glauca*), green foxtail (*Setaria viridis*), and bristly foxtail (*Setaria verticillata*), are weeds that are more or less abundant in fields and gardens of nearly all temperate countries. *Hordeum murinum* is called foxtail grass in California and elsewhere.

FOX TERRIER A terrier, usually white with black or tan markings, originally used for unearthing foxes, but now principally as a pet. See **TERRIER**.

FOY, JAMES JOSEPH (1847-1916). A Canadian lawyer and statesman. He was born in Toronto and was educated at St Michael's College in that city and at Ushaw College, Durham, England. After returning to Canada he studied law and was called to the bar in 1871. He practiced his profession in Toronto and became one of the leaders of the Ontario bar. Actively interested in politics, his sympathy with Irish Home Rule led to his appointment in 1896 as a delegate to the Irish Nationalist Convention, Dublin. In 1898 he was elected a Conservative member of the Ontario Legislature. In 1905 he was appointed Commissioner of Crown lands in the administration of Sir James P. Whitney (qv), but within a year resigned that office to become Attorney-General of Ontario. He was a delegate to Interprovincial Conferences at Quebec (1906) and Ottawa (1910) and to the Federal Conference on Education, London, England (1907). In 1911 he was for a short time acting Premier of Ontario.

FOY, fwa, MAXIMILIEN SÉBASTIEN (1775-1825). A distinguished French general and statesman. He was born at Ham, in Picardy, Feb. 3, 1775. He studied at the artillery school of La Fère and was one of the volunteers of 1791, and during the next nine years served with distinction under Dumouriez, Moreau, Schoenbourg, and Masséna. In 1800 he was made adjutant general in the Army of the Rhine, which marched through Switzerland into Italy, where he commanded the vanguard of the army in 1801. In 1805 he served under Marmont in the Austrian campaign. Two years later Napoleon sent him to Turkey at the head of 1200 artillerymen to assist Sultan Selim against the Russians and British. Under the direction of the French Ambassador, General Sebastiani, Foy defended Constantinople and the Strait of the Dardanelles, forcing Duckworth, the daring British admiral, to retire with loss. After 1808 he fought throughout the Peninsular War, at first under Junot and then as general of division under Soult and Masséna. He distinguished himself in the retreat into France and was severely wounded at Orthez. In 1810 Napoleon made him general of a division. In the campaign of 1815 he commanded a division on the field of Waterloo, where he was wounded for the fifteenth time. In 1819 he was elected deputy by the Department of Aisne. In the Chamber he was the constant advocate of constitutional liberty and showed great rhetorical talent and knowledge of political economy. He distinguished himself particularly by his eloquence in opposing the invasion of Spain in 1823. In 1824 he was returned to the Chamber by three constituencies. Madame Foy published in 1827, from her husband's papers, *Histoire de la guerre de la péninsule*. In the previous year appeared his *Discours* with a biography. Consult Vidal, *Vie militaire et politique du général Foy* (Paris, 1836), and Girod de l'Ain, *La vie militaire du général Foy* (ib, 1900).

FOYATIER, fwa'yá'tyá', DENIS (1793-1863). A French sculptor, born at Bussière (La Grande), Loire. First instructed by Marin at Lyons, he studied afterward under Lemot, and from 1817 at the Ecole des Beaux-Arts in Paris. For the statue of a "Faun" he was awarded the gold medal in 1819, and thenceforward executed numerous commissions for public buildings and churches in Paris and other cities. His more noteworthy works include a statue of "Spartacus" (1827, Tuileries Gardens), which established his reputation, the monument of Colonel Combes at Feurs (Loire), a statue of "St Mark," in the cathedral at Arras, "Wisdom" (1831), in the Chamber of Deputies, Paris, "Faith," in Notre Dame de Lorette, Paris, "Figures of Apostles," in the Madeleine, Paris, the great frieze in relief, on the Arc de l'Etoile, Paris, and the "Equestrian Statue of Jeanne d'Arc" (1855), at Orléans. Foyatier possessed elegance and facility, but never emancipated himself from classical traditions.

FOYER, fwa'yá' (Fr, hearth). In the original French sense of the word as applied to houses of amusement, a room or hall for the informal social gathering or promenading of the spectators during intermissions, usually a long, handsome hall over the entrance vestibule. In some theatres there are separate foyers for the occupants of the more expensive seats and boxes, and of the galleries, in some there is also a foyer for the artists. The most splendid

of all foyers is that of the Paris Opera House, by Garnier. In the United States the term signifies generally a spacious lobby at the head of the main stairs rather than a separately inclosed room.

FOYLE, foil, LOUGH. An inlet of the Atlantic on the north coast of Ireland, between the counties of Londonderry and Donegal. It is 16 miles long, 1 mile wide at its entrance, and 9 miles wide along its south side (Map, Ireland, D 1). A great part of it is dry at low water. The west side alone is navigable for vessels of 600 tons, which ascend its chief tributary, the Foyle, to Londonderry. The river Foyle, formed by the confluence of the Mourne and Finn at Lifford, flows 14 miles northeast to the lough. It has salmon fisheries.

FRA ANGELICO. See **ANGELICO**, **FRA**.

FRAAS, frās, **KARL NIKOLAS** (1810-75). A German agriculturist and botanist, born at Ratelsdorf, Upper Franconia, and educated at Munich. In 1835 he became inspector of the court garden at Athens, Greece, and from 1836 to 1842 was professor of botany in the University of Athens. He was professor of agriculture at the University of Munich from 1847 to 1853, when he became director of the Institute of Veterinary Surgery in that city. He was chief secretary of the Bavarian Agricultural Society, and in association with Liebig conducted the agricultural experiment station organized by that society. Probably no other man of his time did so much to modernize agricultural methods in Bavaria, and his efforts in behalf of fish hatcheries were scarcely less noteworthy. His works include *Die Schule des Landbaues* (5th ed, 1871), *Die kunstliche Fischerzeugung* (2d ed, 1854), *Geschichte der Landbau- und Forstwissenschaft seit dem 16ten Jahrhundert* (1866), *Das Wurzelleben der Naturpflanzen* (2d ed, 1872).

FRAAS, **OSKAR** (1824-97). A German geologist, born at Lorch. He studied theology at the University of Tübingen and held pastorates in various parts of Germany. But turning his attention to geology, he was successively appointed custodian of the Royal Cabinet of Natural History at Stuttgart (1854) and professor of geology (1856). Already as a student he had received a prize for a geognostic chart of Tübingen, and in 1859 he was engaged with Deffner in preparing a similar chart of Württemberg. In 1866 he made important archaeological discoveries at Schussenried, Württemberg, and in 1875, on behalf of Rustem Pasha, he made the first geological survey of the Lebanon, described by him in the publications entitled *Drei Monate am Libanon* (2d ed, 1876) and *Geologische Beobachtungen am Libanon* (1878). Among his other works are *Vor der Sündflut Eine populäre Geschichte der Urwelt* (2d ed, 1870), *Geognostische Beschreibung von Württemberg, Baden und Hohenzollern* (1882), *Geognostisches Profil vom Nil zum Roten Meer*.

FRA BARTOLOMEO. See **BARTOLOMEO**.

FRACASTORO, fra'kas-tō'rō, **GIROLAMO** (1483-1553). An Italian poet and physician, born of an ancient family at Verona. At the age of 19 he was appointed professor of logic in the University of Padua. On account of his eminence in the practice of medicine, he was elected physician of the Council of Trent. His Latin verse also exhibits remarkable elegance. A bronze statue was erected in his honor by the citizens of Padua, while his native city com-

memorated their great compatriot by a marble statue. His writings in prose and verse are numerous. The chief among them are *Syphilidis, sive Morbi Gallici* (1530), *De Vini Temperatura* (1534), *Homocentricorum sive de Stellis, de Causis Criticorum Dierum Libellus* (1535), *De Sympathia et Antipathia Rerum, De Contagionibus et Contagiosis Morbis, et eorum Curatione* (1546). The collected works of Fracastoro appeared for the first time in 1555.

FRACKVILLE. A borough in Schuylkill Co., Pa., 50 miles northeast of Harrisburg, on the Pennsylvania and the Philadelphia and Reading railroads (Map, Pennsylvania, J 5). Coal mining is the chief industry, the Mahoney Plane, over which is hoisted some 50,000 tons of coal daily, being situated here. Pop., 1900, 2594, 1910, 3118.

FRACTION (Fr, OF *fraction*, Lat *fractio*, from *frangere*, to break, connected with Goth *brīkan*, OHG *brehhan*, Ger *brechen*, AS *brecan*, Eng *break*, and possibly with Gk *ῥήγνυμι*, *rhēgnymai*, to break, OIr *conbrog*, breaks). A fraction is commonly defined in arithmetic as one or more of the equal parts of a unit or quantity. This definition, however, is not sufficient for ex-

pressions like $\frac{2}{-3}$, $\sqrt{2}$ since "2 of the -3 equal

parts of unity," or "one $\sqrt{2}$ th of 3," is meaning-

less. Hence, in general, the symbol $\frac{a}{b}$, in

which b is not zero, is regarded as denoting the division of a by b .

A fraction is said to be irreducible, or to be in its lowest terms, when the greatest common divisor of its terms has been suppressed. In arithmetic a fraction whose numerator is less than its denominator is called a proper fraction. In algebra a proper fraction is one whose numerator is of less degree than its denominator. In the contrary cases the fractions are called improper. Numerical fractions of the older form, as $\frac{3}{4}$, are called common or vulgar fractions as opposed to the more recent form of 0.75, called decimal fractions. (See **DECIMAL SYSTEM**). The term was originally applied to this form as opposed to the "astronomical" or "physical" fractions, i.e., those on the sexagesimal system. The operations with algebraic fractions are subjected to the associative, commutative, and distributive laws (*qv*), e.g.,

$$\frac{a}{b} + \left(\frac{c}{d} - f \right) = \left(\frac{a}{b} + \frac{c}{d} \right) - f,$$

$$\frac{a}{b} \cdot \frac{c}{d} = \frac{c}{d} \cdot \frac{a}{b},$$

etc. Fractions of the form $\frac{a}{\frac{b}{c}}$ are called com-

plex fractions, and obey the same laws as simple fractions, e.g., the complex fraction just mentioned equals

$$\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c} = \frac{ad}{bc}$$

Complex fractions of the form

$$\frac{\frac{a}{b+c}}{\frac{d}{e} + \dots}$$

are called continued fractions. Such fractions are usually simplified to the best advantage by first multiplying the terms of the last fraction of the form

$$\frac{c}{d + \frac{e}{f}}$$

by the last denominator, and so working up. The theory of continued fractions, however, is extensive, and the properties of such fractions are numerous. In the above fraction,

$$\frac{a}{b}, \frac{ad}{bd+c}, \frac{a(fd+e)}{b(fd+e)+fc}, \dots,$$

are the simplified forms of the fraction inclusive of the first, second, and third denominator successively, and so on. These are fractions evidently converging towards the true value of the given fraction. It is proved in algebra that the difference between any two consecutive convergents is equal to 1 divided by the product of their denominators, that the value of the fraction lies between each successive pair of convergents and hence differs from either by less than their difference, e.g.,

$$\frac{6935}{2151} = 3 + \frac{482}{2151} = 3 + \frac{1}{\frac{2151}{482}}$$

$$3 + \frac{1}{4 + \frac{1}{2 + \frac{1}{6 + \frac{1}{5 + \frac{1}{7}}}}}$$

or, as it may be written,

$$\frac{3}{1} + \frac{1}{4} + \frac{1}{2} + \frac{1}{6} + \frac{1}{5} + \frac{1}{7}.$$

Here the convergents are

$$3, \frac{13}{4}, \frac{29}{9}, \frac{187}{58}, \frac{964}{299}, \frac{6935}{2151}.$$

The difference between the last two convergents is $\frac{1}{299 \cdot 2151} = 0.0000016$, hence the next to the last convergent, expressed decimally, gives the value of the original fraction correct to 5 decimal places.

A fraction whose numerator is an integer and whose denominator is an integral power of 10 is called a *decimal fraction*, e.g.,

$$\frac{1}{10}, \frac{1}{100}, \frac{3505}{10000}$$

are decimal fractions, although given in the form of common fractions. Such fractions admit of an abbreviated notation, e.g., 0.1, 0.01, 0.3505, which notation possesses great advantages in calculation. See also CIRCULATING DECIMALS.

In some algebraic fractions the substitution of a particular value of the letters will make both numerator and denominator vanish. Such fractions are called *vanishing* fractions, e.g.,

the fraction $\frac{x^2-1}{x-1}$ becomes $\frac{0}{0}$ when $x=1$. The value of a fraction which assumes the form $\frac{0}{0}$ for particular values of the letters involved is,

in general, found by means of the differential calculus. But frequently that value may be found by simpler means, as in the above example

$$\frac{x^2-1}{x-1} = \frac{x-1}{x-1} (x+1) = x+1,$$

the limit of which, for $x=1$, is $1+1=2$. See LIMITS.

Doubtless the notion of a fraction is nearly as old as the notion of number. Among the oldest treatises on fractions is the arithmetic of Ahmes (q.v.), showing how the Egyptians dealt with fractions before the year 2000 B.C. They made extensive use of unit fractions, i.e., fractions with the numerator 1. In the hieratic writing the denominator with a point above it was the symbol for such a fraction. The first problem Ahmes solves is that of separating a fraction into unit fractions, e.g., he finds

$$\frac{2}{9} = \frac{1}{6} + \frac{1}{18}, \quad \frac{2}{95} = \frac{1}{60} + \frac{1}{380} + \frac{1}{570}$$

The early fractions of the Babylonians were apparently also unit fractions, but they later developed a system which the Greek astronomers worked into the sexagesimal fractions used even yet in angle measure. In the written form only the numerator of a sexagesimal fraction was given, with a special fractional sign attached. The Greeks wrote the numerator of a common fraction below or else before the denominator thus.

$$\frac{\kappa\alpha}{\iota\zeta}, \text{ or } \frac{\kappa\alpha'}{\iota\zeta'}, \text{ or } \iota\zeta' \kappa\alpha'' \kappa\alpha'' = \frac{17}{21}.$$

The Romans made much use of the duodecimal system, and gave special names to their fractions which corresponded to

$$\frac{1}{12}, \frac{2}{12}, \dots, \frac{11}{12}$$

To the Hindus is due the present form of the common fraction, although they generally omitted the bar between numerator and denominator. Although the sexagesimal and duodecimal fractions prepared the way for decimal fractions, the latter did not appear in their present form until early in the seventeenth century. Among the first to use such fractions were Rudolf, Bürgi, and Stevin. The first general use of the decimal point is found in the trigonometric tables of Pitiscus (1612), although it had been used by Pellos (1492) in a special case. In the sixteenth century various forms were used, but after about 1600 the period or comma became quite universal.

FRACTURE (Lat. *fractura*, a break, from *frangere*, to break). In surgery the term is used of the break of a bone or of partially ossified cartilage. A fracture is said to be *simple* when the break is not open to the air, *compound* when it is so open, *single* when there is but one break, *multiple* when more than one break exists, *comminuted* when the bone is broken into many little pieces, *unimpacted* when one fragment of the bone is driven into the other, *complicated* when a neighboring joint or large blood vessel is involved in the traumatism; *complete* when the whole thickness of the bone is ruptured, *incomplete* (or green stick) when the bone is partly broken, partly bent, *intracapsular* when the break occurs within the capsule of a joint, and *transverse*, *oblique*, *longitudinal*, or *spiral*, according to the direction and

position of the break as regards the shaft of the bone

Among the external causes of fracture are accident or violence and excessive muscular action. The condition known as *fragilitas ossium* occurs late in life or in early life, as a softening of the bone from disease. Cancer, syphilis, scurvy, and rickets often result in altered bone structure. Muscular action causes rupture of *patella* or *os calcis* (heel bone) during the endeavor to prevent falling after tripping or in running or jumping. The symptoms are pain over the region, swelling and great local tenderness, change in position or shape of the part, false point of motion, crepitation (crackling, as the broken ends of the bone are rubbed together), and immobility on the part of the patient, together with increased motion secured by the examining surgeon. In impacted fractures there is necessarily no crepitation, false point of motion, or mobility elicited by the surgeon. Fractures must be reduced, i.e., the fragments must be put into their proper position, and they must be retained by some apparatus. The splints used for retention are made of wood, tin, iron, felt, spongiopiline, gutta-percha, leather, or of bandages saturated with plaster of Paris, with starch, or with soluble glass ("water glass," silicate of soda solution). The limb is padded with cotton and the splint applied closely and rendered immovable. In the case of fractured ribs a strip of adhesive plaster or a corset is applied. Rest must be secured, otherwise (or, in some cases, in spite of good attention) the fracture remains ununited, when rubbing the ends together, giving mercury internally to salivation, electricity or drilling holes in the ends, or wiring the ends together must be tried, to secure union. Of late years Lane's bone plates have been much in favor among surgeons. These are flat metal plates drilled with holes for screws or pegs, and are fastened directly to the injured bones, holding them immovably in place. Compound fractures must be treated as described, and also as open wounds, under all antiseptic precautions. Drainage of pus and discharge must be secured, as well as protection against bacterial infection. See *CALLUS*.

The X-rays play an important part in the modern diagnosis and treatment of fracture. Not only is it possible by their means to ascertain the precise position of the bones involved, but the surgeon can assure himself of their correct replacement and scrutinize the progress of healing.

FRADENBURGH, frā'den-bū'g, JASON NELSON (1843-) An American Methodist Episcopal clergyman, born at Gouverneur, N. Y. He graduated from Genesee Wesleyan Seminary and from Genesee College (later Syracuse University). At the seminary he was professor of mathematics in 1868-69, and at the Fredonia (N. Y.) State Normal School professor of ancient languages in 1869-73; and he was principal of the State Normal School at Mansfield, Pa., in 1873-75. He held pastorates at Cleveland, Ohio, and at Clarion, Pa., after 1896. He is author of *Witnesses from the Dust* (1885), *Beauty Crowned* (1887); *Living Religions* (1888), *Old Heroes* (1889), *Departed Gods* (1891), *Fire from Strange Altars* (1891); *Light from Egypt* (1897); *Life's Springtime* (1900); *History of Erie Conference* (1907); *In Memoriam, Henry Harrison Cummings* (1913).

FRA DIAVOLO, fra dē-a'vō-lō (It., Brother Devil) (?1770-1806) A celebrated Italian brigand, born in Calabria, whose real name was Michele Pezza. He gathered a band of outlaws in the mountains of Calabria, in the country around Itri in Terra di Lavoro, and attacked alike strangers and villagers of the neighborhood. His atrocious cruelty and the fact that he had originally been a monk gained him the name of Fra Diavolo. Ferdinand of Naples summoned him to his aid against the French and made him colonel. In 1799, together with Cardinal Ruffo, he tried to stir up an insurrection in Calabria. In 1806 he repeated his attempt. He was seized by Masséna at San Severino and was hanged at Naples as a bandit in spite of his regular colonel's commission. Auber's famous opera *Fra Diavolo*, libretto by Scribe, does not pretend to the least historical truth. Consult *Amante, Fra Diavolo e il suo tempo 1796-1804* (Florence, 1904).

FRA DIAVOLO. An opera by Auber (qv), first produced in Paris, Jan. 28, 1830, in the United States, April, 1832 (New York).

FRAENKEL, frēn'kel, KARL (1861-) A German bacteriologist, born in Charlottenburg and educated at Berlin, Heidelberg, Leipzig, and Freiburg. At Berlin he became assistant in the Institute of Hygiene in 1885 and privatdocent in 1888. He became professor at Königsberg in 1890, at Marburg in 1891, and at Halle in 1895. With Brieger, about 1890, he proved the proteid character of extracellular toxins, and he isolated the *Pneumococcus* and, in meningitis, the *Diplococcus lanceolatus*, sometimes called by his name. Among Fraenkel's published works are *Grundriss der Bakterienkunde* (1886, 3d ed., 1890, atlas, 1889, revised 1895), *Diphtheriebazillen* (1893), *Meningokokkus auf der Conjunctiva* (1899), *Spirillen des Zeckenfiebers* (1907).

FRAGA, fra'gā. A town in the Province of Huesca, Spain, about 15 miles southwest of Lérida, on the river Cinca (Map Spain, F 2). It is built on a slope and has ruined walls, among its buildings of note are the town hall and the old parish church of San Pedro, once a mosque. The town is in a fertile agricultural section, celebrated for its figs and pomegranates, which constitute the chief exports. Stock raising and some manufacturing also are carried on. Pop., 1900, 6934, 1910, 7418. Fraga, according to some authorities, is the Gallica Flavia of the Roman Empire. Of considerable importance under the Moors and for a time a separate emirate, it was captured by the Christians in 1149, after having been previously taken, but retaken. Fraga was specially honored in 1709 by Philip V for its loyalty in the War of the Spanish Succession.

FRAGIACOMO, fra'ja-kō'mō, PIETRO (1856-) An Italian marine and landscape painter. He was born at Trieste, came to Venice in his early youth, and studied there at the Academy and under Favretto. Fragiaco is one of the leading contemporary Italian landscape painters. His subjects are always Venetian and his paintings have a fine lyrical quality and an element of originality. A keen observer of nature and a fine colorist, he depicts with equal mastery the sea and lagoons in many of their various aspects—barks and fishermen, the distant horizon, and the sky with its ever-varying light effects. Especially noteworthy among his paintings are "Peace" (1891), in the Royal

Villa, Moriza, "Mournfulness" (1892), in the National Gallery, Berlin, "San Marco" (1899), in the Vienna Museum, "On the Seashore" and "End of a Summer's Day," exhibited at the Paris Exposition in 1900, "Harmony of Silence" (1910)

FRAGMENTAL ROCKS See **SEDIMENTARY ROCKS**

FRAGMENTA VATICANA (Lat, Vatican Fragments) A body of law documents in part preserved in a palimpsest, now in the Vatican library. They are thought to date from the time of Constantine

FRAGONARD, fra'gô'nar', JEAN HONORÉ (1732-1806) One of the most distinguished painters of the rococo period in France. He was born April 5, 1732, at Grasse, in Provence, the son of a glovemaker. The family removed to Paris, where the lad was apprenticed to a notary. At 18 he began the study of painting with Chardin, from whom he learned the rudiments of art, after which he was a pupil of Boucher, his true master. He won the Prix de Rome in 1752, and after three years' prescribed preliminary study under Carl van Loo he spent four years in Italy. At Rome he worked under the guidance of Nattoire, but was not influenced by the Italian masters whom he copied. He traveled with the Abbé de Saint Non in Naples and Sicily, making drawings for this distinguished amateur's books. On their return journey to Paris (1761) they stopped at Venice, where Fragonard was influenced by Tiepolo. In 1765 his "Coresus and Callirhoe" procured his admission to the Academy, and was bought by the King for reproduction in the Gobelins. Disgusted with his difficulty in obtaining payment from the King, he turned from historical to the gallant subjects popular with the aristocracy and at the theatre. His attractive personality made him a welcome guest and he lived the joyous life he depicted. The celebrated "Swing," now in the Wallace collection, London, established his reputation in this genre and brought him many similar commissions. In 1771 he was commissioned to decorate a pavilion for Madame du Barry at Louveciennes, the subjects depicting the "Romance of Love and Youth," in idealized representations of Louis XV and his favorite. Taken in its entirety, this series is perhaps his most remarkable achievement. The chief subjects represented are "The Pursuit," "The Meeting," "Memories," "The Lover Crowned," and "The Abandonment." Besides these there are five minor designs of cupids and four purely decorative designs. The work was refused by du Barry, who, however, gave the artist 18,000 livres. The decorations passed from the artist's possession to his friend M. Maubert at Grasse, whose descendants sold them in 1898 for 1,250,000 francs. They were purchased by the late J. P. Morgan, in 1914 were exhibited in the Metropolitan Museum, New York, and in 1915 were bought by Henry Clay Frick. Fragonard undertook a similar work for the dancer Marie Guimard, but he refused to finish it. Among other ambitious works of this period are "The Fête of Saint-Cloud," also called "The Marionettes," a large canvas for the Banque de France, "Blind Man's Buff" and "The Swing" (both in the Grout collection, Paris), in which the landscapes are particularly charming. His happy marriage in 1769 with Marie Anne Gérard, a miniature painter of his native town and his pupil, gave rise to subjects of a domestic char-

acter such as "The Happy Mother" and "The Cradle." Admired sepiæ studies of his wife and little daughter are in the Besançon library. The Revolution ruined Fragonard's fortunes, and though befriended by Louis David, he preferred during the Terror to retire to Grasse. On his return to Paris he was unable to adopt the cold, classic manner of the painting then in vogue and died, poor and forgotten, Aug. 2, 1806.

Fragonard's art is the culmination of 18th-century painting in France. Never has the gaiety, frivolity, and charm of the ancien régime been so delightfully represented. His paintings are exquisite in color, free and graceful in line, and especially characterized by the jaunty pose and dainty movement of the figures. The Louvre possesses 15 of his paintings, including "The Bathers," "The Sleeping Bacchante," "The Shift Withdrawn," "The Shepherd's Hour," "The Music Lesson," and "Inspiration." He is richly represented in the Wallace collection, London, by the "Fountain of Love," "The Love Inscription" (Le Chiffre d'Amour), "The Fair-Haired Child," and "The Schoolmistress"; at St. Petersburg are "The Stolen Kiss" and "The Farmer's Children." He is represented in many French provincial collections and there are numerous fine examples in private collections, such as "Le Billet Doux," "Mlle. Colombe" (Rothschild collection, London), "The Pasha," two fine portraits of the dancer Guimard, and two of Fragonard himself. His drawings, especially those in sepiæ, of which a large number survive, are very fine. He designed a delightful set of illustrations for La Fontaine's *Fables* and was also an etcher of ability, the best-known plate being "L'Armoire."—His son and pupil, ALEXANDRE ÉVARISTE (1780-1850), born at Grasse, studied also under David, whose style he imitated. He painted historical pictures, such as "Entry of Joan of Arc into Orléans" (Orléans Museum), and several decorative paintings, in the Louvre. His illustrations and designs for prints were popular during the Revolution, and he was also known as a lithographer and as a sculptor, in which latter capacity he modeled a bas-relief for the Palais Bourbon, Paris.

Bibliography. The most complete biography of Fragonard is by Portalis (Paris, 1883), the latest, with admirable illustrations, is by De Nolhac (ib, 1906). Consult also De Goncourt, *L'Art du XVIIIème siècle* (ib, 1874); Nacquet, *Fragonard* (ib, 1890), Jozs, *Fragonard—mœurs du XVIIIème siècle* (ib, 1901), Maclair, in *Les grands artistes series* (n. d.).

FRÄHN, frän, CHRISTIAN MARTIN JOACHIM (1782-1851) A German-Russian ethnologist, born at Rostock and educated in that city and at Göttingen and Heidelberg. He was appointed professor of Oriental languages at the University of Kazan in 1807, and chief librarian at the Academy of Sciences, St. Petersburg, in 1815. His principal works treat chiefly of the ethnology of the various races of Russia. They are based upon considerable research and include. *Nova Supplementa* (1855-77), *Ueber die Russen und Chazaren* (1819); *Ibn Fozzlans und anderer Araber Berichte über die Russen alterer Zeit* (1823), *Die ältesten arabischen Nachrichten über die Wolga-Bulgaren* (1832); *Ein neuer Beleg dass die Gründer der russischen Staats Nordmannen waren* (1838), *Rapports concernant des collections orientales de l'Académie Impériale* (1838).

FRAIKIN, frā'kän', CHARLES AUGUSTE (1819-

93) A Belgian sculptor, born at Herenthals, Province of Antwerp. He studied at the Academy of Brussels and under Puyenbroeck. He modeled a large number of monuments for squares, public buildings, and churches, among the best of which are 11 statues for the Hôtel de Ville, Brussels, the statues of the counts Egmont and Hoorn, for the great square of that city (now in the Place du Petit Sablon), the allegorical statues of the "City of Brussels," in the Place Rouppe, the fine tomb of Queen Marie Louise of Belgium at Ostend. His ideal works include "Venus with the Dove", "Captive Love," in the Brussels Museum, "Venus Anadyomene," in the Royal Palace, Brussels. Good examples of his work as a portraitist are a bust of King Leopold, in the Château de Laeken, and of Queen Marie Henriette, in the Royal Palace, Brussels. Plaster casts of all his works are in the Musée Frankin at Herenthals. They are spirited in conception and show variety of style and facility of execution, his ideal statues have much grace and voluptuous charm.

FRANKŌI, frō'knō-i, VILMOS (1843-) An Hungarian historian, born at Urmény. He was educated at the University of Pest, entered the priesthood and was appointed professor at Gran in 1865, and was made librarian of the National Museum in 1875, titular Bishop of Arbe in 1892, and chief inspector of Hungarian museums and libraries in 1897. In 1900 he became inspector of the Hungarian Historical Institute at Rome, which he had founded. His works, based upon exhaustive researches and mostly written in the Hungarian language, but also appearing in German versions, deal with Hungarian history, especially in the fifteenth and sixteenth centuries. *Peter Pazman and his Time* (1867-72), *A Popular History of Hungary* (1873), *Matthias Hunyady* (1890), *The Relations of Hungary to the Holy See* (1901-03).

FRAMBESIA. See YAWS

FRAME (AS *fremman*, *fremian*, Icel. *framja*, *frama*, OHG *fremman*, *freman*, to advance, further, from AS *fram*, *from*, Icel. *framr*, Ger. *fram*, earnest, pious, connected with AS *from*, *fram*, Goth. Icel. OHG *fram*, from Gk. *népav*, *peran*, Skt. *para*, beyond). The boxlike covering of any kind of hotbed, flued pit, or cold pit, to protect or forward plants at seasons of inclement weather. Frames are usually made of wood and covered with glass or cloth. The popular form is 6 × 12 feet and several inches higher at the rear than in front. The word "cold" used to qualify "frame" or "pit" implies the absence of other heat than that from the sun. See HOTBED

FRAMING. The jointing, putting together, or building up of the skeleton or frame of any structure, used particularly in speaking of steel or wooden buildings and ships (qqv)

FRAMINGHAM, frā'mīng-hām. A town in Middlesex Co., Mass., including the villages of Framingham Centre, South Framingham, Saxonville, and Nobscot, 21 miles west of Boston, on the Boston and Albany and the New York, New Haven, and Hartford railroads (Map Massachusetts, E 3). It is the seat of a State normal school and has a public library, an historical and natural history society with a valuable collection, an almshouse, a public and two private hospitals, and a Home for the Aged. South Framingham is the principal business centre and has manufactures of tags, crêpe paper, gummed labels, paper boxes, boots and

shoes, rubber and straw goods, Saxonville manufactures worsted and woolen yarns, wool blankets, and worsted cloth. Other manufactures of the town include steam boilers, sugar and coffee machinery, heaters, agricultural implements, etc. The government is administered by town meetings. The water works are owned by the municipality. Framingham was settled about 1647, was known as Danforth's Plantation until 1700, when it was incorporated under its present name (from Framlingham, England). Pop., 1900, 11,302, 1910, 12,948, 1914 (U S est.), 13,648, 1920, 17,033. Consult Barry, *History of Framingham* (Boston, 1847), and Temple, *History of Framingham* (Framingham, 1887).

FRA MOREALE, mō'ia-a'lā. See MONTREAL D'ALBANO

FRAMPTON, SIR GEORGE JAMES (1860-) One of the foremost English sculptors of the early twentieth century. He studied at the Lambeth Schools under W S Frith, at the Royal Academy, and in Paris under Mercié and the painter Dagnan-Bouveret. There was nothing unusual about his early work in marble and bronze, except its sound technical ability. It treated ideal subjects, beginning with "Socrates Teaching" (1884) and ending with the striking "Children of the Wolf" (1892). He then declared himself against all "white sculpture" and devoted himself to color effects in all manner of material, such as the female bust, "Mysteriarch," and the stately statue, "Dame Alice Owen," in bronze and marble, the "Lamia," in jeweled bronze and marble, and the youthful "St George," mounted on an agate globe with mother-of-pearl background. He excels especially in purely decorative work, e.g., the terracotta façade of the Junior Constitutional Club, London, the sculptures of the Glasgow Art Gallery; and the remarkable bronze memorial to Charles Mitchel, shipbuilder, at Newcastle. Although primarily devoted to ideal and decorative sculpture, he modeled a number of portrait statues of great originality, the best known of which is the colossal bronze Queen Victoria at Calcutta. Frampton is one of the most gifted and original sculptors that Great Britain has ever produced. Besides being the greatest decorative genius of the school, he excels also in modeling. His figures are highly suggestive of intellect and imagination, and show pathetic gravity of expression, but the designs often lack unity. He became a member of the Royal Academy in 1902, was president of the Society of British Sculptors in 1911-12, and was knighted in 1908. He was chosen honorary member of the Milan and other academies, and among his many awards was the grand medal of honor at the Paris Exposition of 1900. Consult Spielmann, *British Sculpture and Sculptors of Today* (London, 1901).

FRANC, frānk (Fr, derived from the device, *Francorum Rex*, King of the Franks, struck by King John II on the coin in 1360). The unit of the monetary system of France and of the States of the Latin Monetary Union—Belgium, Switzerland, Italy, and Greece. At the present time the franc is in fact the twentieth part of the 20-franc gold piece, or 2902 grams of pure gold, equivalent in United States money to 19 3 cents. When the present monetary notation was adopted in France, in 1795, supplanting the former *livre* *tournois*, the franc was a silver coin, nine-tenths fine, weighing five grams. Such coins were discontinued in 1865, when the franc

coin was made a token, 835 fine, without change of weight. As a silver unit it still remained in its multiple the five-franc piece, nine-tenths fine, weighing 25 grams. In 1876 the coinage of the five-franc piece was discontinued. Silver coins of 5, 2, and 1 franc, and $\frac{1}{2}$ franc, are still in general use, but they are all, strictly speaking, tokens, gold having become the standard and being represented in the coinage by pieces of 10 francs and 20 francs. The franc is theoretically divided into 100 centimes, but the smallest coin circulated in France is the five-centime piece, often called by the old term sou. In Italy the equivalent coin is called the lira, and in Greece the drachma. In other countries not in treaty relations with France, the same unit prevails; in Finland, the marc, in Spain, the peseta, in Rumania, the lei, in Venezuela, the bolívar. See LATIN UNION.

FRANC, frank, MARTIN LE (1410-61). A French poet, born in Normandy. He became secretary to the Duke of Savoy, afterward Pope Felix V, and through him obtained various lucrative appointments, such as secretary to Nicholas V. Despite its tedious detail, his long poem, *Le champion des dames* (1530), is valuable for its contemporary references and its vivid local color, and the same may be said of his prose work, *L'estrif de fortune et de vertu* (1519).

FRANÇAIS, fran'sà', FRANÇOIS LOUIS (1814-97). A French landscape painter, lithographer, and engraver. He was born at Plombières, Vosges, and studied at the Ecole des Beaux-Arts and under Corot and Jean Gigoux, and exhibited first in the Salon of 1837. Many of his lithographs, such as "The Bark of Don Juan," after Delacroix, are remarkable, and he was also an excellent engraver on wood, but it is as a landscape painter that he is best known. Although many of his subjects are Italian, he is particularly the painter of the banks of the Seine and the country about Paris. Français belongs to no school, he is an idealist, from the poetical quality of his brush, and a realist because of the restraint and decision of his work. His pictures include "The End of Winter" (1853, Louvre), "Orpheus" (1863), "Daphnis and Chloe" (1872), his masterpiece, "Evening" (Montpellier). He received first-class medals in 1848 and at the Paris expositions of 1855 and 1867, and medals of honor at the Paris Exposition of 1878 and the Salon of 1890. He was elected to the Institute in 1867.

FRANCAVILLA (fran'ka-vél'la). **FONTANA**. A city of south Italy, in the Province of Lecce, midway between Taranto and Brindisi (Map Italy, F 4). It has a large castle, manufactures cloth, leather, and leather goods, and markets oil and wine. Pop. (commune), 1901, 20,422, 1911, 21,527.

FRANCE. A republic of western Europe, lying between lat 42° 20' and 51° 5' N and long 4° 48' W and 7° 31' E from Greenwich. It is bounded on the north by the English Channel, Strait of Dover, and North Sea, on the northeast by Belgium and Luxemburg, on the east by Germany, Switzerland, and Italy, on the south by the Mediterranean and Spain, and on the west by the Bay of Biscay, Atlantic Ocean, and the English Channel. In outline the country is roughly hexagonal, and its perimeter is about equally distributed between seacoast and frontier. The extreme length from the North Sea to the Pyrenees is about 600 miles, the greatest

breadth from the extremity of Brittany to the Vosges is about 550 miles, and diagonally, to Mentone on the Mediterranean, about 675 miles. France ranks fourth in size among European countries, its area, usually stated at 207,054 square miles, is according to the determinations of the War Department, 536,463.7 square kilometers, or 207,128.6 square miles. For national colors, see Plate of FLAGS, and for national coat of arms, see Colored Plate accompanying HERALDRY.

Topography. France possesses natural boundaries throughout and is to a high degree an independent physical unit. The eastern border is girdled by the ranges of the Alps, the Jura, the Vosges, the Rhenish Highlands, and the Ardennes, which separate France from the countries of central Europe, the Spanish frontier is defined throughout its extent by the Pyrenees. The ranges on the east are broken in places by gaps and passes, through which commercial communication is maintained with the bordering states. The Pyrenees, however, present a great unbroken wall, communication with Spain being had around their extremities. On the northwest, west, and southeast the boundaries are formed by open seas, the total coast line measuring about 1950 miles. Much of the coast line is unbroken by important inlets, with the result that good harbors are comparatively few. Most of the harbors are river ports or are protected by breakwaters, as at Cherbourg. The northwest coast, which confronts the southern shores of England, is intersected by the deep inlets of the Somme and the Seine and has an irregular course, owing to the prominent peninsula of Normandy (called Cotentin), to the many capes, and to minor indentations. It varies in character from low, sandy stretches, as on the North Sea, to bold, rocky cliffs, such as are exposed in the Pays-de-Caux, between Dieppe and Havre, and on the north coast of Brittany. Between the latter peninsula and Normandy is the broad indentation occupied by the Gulf of Saint-Malo, with the Channel Islands (qv), which are held by Great Britain, although physically belonging to the mainland. The west coast, from Pointe Saint-Mathieu, the extremity of Brittany, to the Gironde, maintains an irregular outline and is intersected by the bays of Douarnenez, Quiberon, Bourgneuf, by the Pertuis Breton, and the Pertuis d'Antioche, and by the estuarine mouths of the Loire and the Gironde. The low and generally sandy shore is fringed by islands, of which the largest are Ouessant (Ushant), Belle Ile, Ile de Noirmoutier, Saint-Martin de Re, and Ile d'Oleron. Southward of the Gironde the coast, formed by a straight, monotonous stretch of dunes, is bordered by the arid moors of the "Landes," the Bassin d'Arcachon being the only important indentation in this section. The Mediterranean coast, by which France enjoys easy access to Africa and the east, stretches in a broad double curve from the Pyrenees to the Maritime Alps. Bold and rocky on the extreme west, it soon becomes low and sandy, inclosing numerous lagoons, but without good harbors. Near the middle the Rhône has built its delta seaward and incloses between its mouths the island of Camargue. East of the Rhône the shore conforms to the projecting spurs of the Provençal Highlands and of the Maritime Alps, which shelter the harbors of Marseilles, Toulon, Cannes, and Nice.

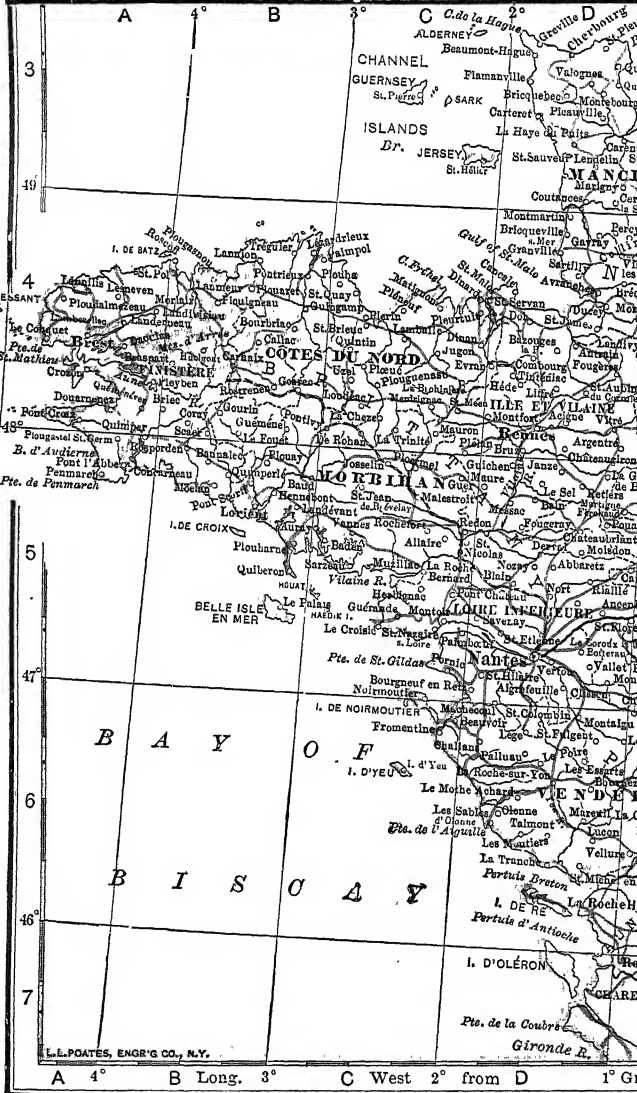

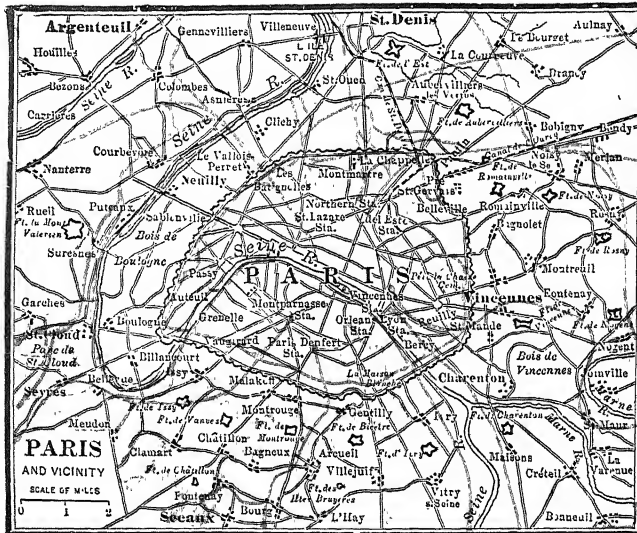

The physiography of France, broadly considered, falls naturally into regions that are determined, in their position and surface features, by the events of geological history. There are, thus, the regions of highlands on the eastern and southern borders, the great central plateau in the south-central part west of the Rhône valley, the lower plateau of Normandy and Brittany, and the extensive plains in the north and west, occupied by the basins of the Seine, the Loire, and the Garonne. A line drawn diagonally across the country from Bayonne in the southwest to the Ardennes of south Belgium in the northeast roughly divides the rolling low plains to the west of it from the central plateau and highlands to the east of it. The mean altitude of the country is about 1000 feet, but the western section averages less than 650 feet. As the chief relief is concentrated in the south and east, the land slope is towards the Atlantic, the Rhône alone, of the large rivers, takes a southerly course into the Mediterranean.

The Alps on the southeast border are the most important highlands in the country. They extend from the Mediterranean north to Lake Geneva, a distance of 150 miles, and with the flanking chains and foothills they occupy the entire area between Italy and the Rhône valley. The principal groups are the Maritime, the Cottian, the Graian, and the Pennine Alps, or, according to their situation in former provinces, they may be divided into the Alps of Provence, Dauphine, and Savoy. The Maritime Range on the extreme south enters France from Italy, where it has its culminating point, the highest peak across the border, French territory, being the Cime du Diable, 8816 feet. To the north the ranges increase in elevation, and the Cottian Alps are crowned by the Aiguille de Scolette, 11,500 feet above the sea. Across Mont Genève a pass leads from the valley of the Durance, in France, to that of the Dora Riparia, in Italy, which has been used as a highway since ancient times. West of the Cottian Range is the small group of the Oisans, culminating in Les Ecrins, 13,462 feet, and north of it are the lofty Graian Alps, snow-capped and carrying glaciers on their rugged slopes, with a crest averaging nearly 10,000 feet in altitude. Near their southern end are the Pass of Mont Cenis (6850 feet) and the railway tunnel of the same name, now the principal line of communication with Italy. The Alps culminate in Mont Blanc (15,781 feet) of the Pennine Range, and thence northward to the shores of Lake Geneva there is a gradual decrease in altitude. Interrupted by the valley of the Rhône, the line of highlands is continued on the north by the Jura Mountains, which are formed by several parallel groups resting upon a plateau tilted towards the west, and thus falling to the valleys of the Saône and the Doubs. The Jura Mountains follow a nearly north direction at first, but gradually bend to the east and enter Swiss territory, where, or on the frontier of France, they attain their maximum elevation of over 5600 feet (Crêt-de-la-Neige). The Vosges, separated from the Jura by the gap at Belfort, now form a part of the French frontier, their eastern slopes fronting upon Alsace, which since 1871 has been incorporated into the German Empire. Their crest is a flat-topped mountain ridge, broken by peaks of 4000 to 4700 feet elevation, connecting in the southern part with the Monts Faucilles, a low range that extends westward in the form of an

arc between the sources of the Saône and the Meuse and Moselle. A northern offshoot of the latter highlands stretches along the left bank of the Meuse and is continued by the Forest of Argonne to the low plateau of the Ardennes, of which only a small portion lies in France. The Pyrenees, rising with great abruptness on the south border, extend from the Mediterranean to the Bay of Biscay. A height of 9100 feet is attained in Mont Camgou, near the Mediterranean, and farther west this altitude is exceeded by Montcalm (10,000 feet), Pic Long (10,475 feet), Pic du Midi (9400 feet), and by others on the French side, and by still loftier elevations south of the border. In its conformation the chain is a true sierra, having a uniform crest line that is notched by slight gaps, usually but little below the level of the neighboring peaks. Passes, practicable for railways, are found along the low coast strips at the extreme ends, but between these points there are but few highways leading from France to Spain that can be traversed without great difficulty.

The central plateau, south of the Loire and west of the Rhône, is the chief physiographic feature of central France. The plateau rises sharply from the Mediterranean and Rhodanian depressions in several groups of highlands that are collectively known as the Cevennes. Beginning on the southwest with the Montagne Noire, at the passage of Naurouse, between the Aude and the Garonne, which lies at the base of the Pyrenees, the elevations include in their generally northeasterly course Monts de l'Espinousse, Monts Garrigues, and the Cévennes in the lesser sense, terminating with Mont Lozère (5584 feet). Northward the range is continued by the Monts du Vivarais, with the volcanic Mont Mézenc (5755 feet), by the mountains of Lyon-nais and Beaujolais, and by a succession of highlands to the elevated region of Côte d'Or, and the plateau of Langres, between the Saône and the sources of the Seine. The central plateau gradually falls off in elevation to the northwest, but in Auvergne it has been broken by volcanic eruptions. The denuded cones of the extinct volcanoes are still conspicuous in numerous minor elevations near Clermont-Ferrand, and in the more massive mountains—Puy-de-Dôme (4806 feet), Mont Dore (6187 feet), and Plomb du Cantal (6096 feet). South of the volcanic region the plateau receives a special character by the Causses, sterile limestone table-lands whose surface has been dissected by erosion into deep gorges and ravines. North of this region the low mountains of the Morvan Range divide the waters of the Loire and the Saône. Bordering the central plateau are the fertile plains of central France on the north, the plains of Périgord and Poitou on the west, and the plains of Gascony across the Garonne on the southwest.

Normandy and Brittany (ancient Armorica) are to be considered as an isolated plateau whose surface, worn down by long-continued erosion, has a general altitude of less than 1000 feet. In Brittany the plateau, much less dissected than in Normandy, is broken by two lines of monadnocks—the Monts d'Arée and the Montagne Noire—which run out to the two promontories that inclose the Bay of Douarnenez. The Monts d'Arée on the north culminate in Saint-Michel (1285 feet), the highest peak in Brittany, and the Montagne Noire in Menez Horn (1080 feet).

In Normandy the elevations are grouped along no general lines but the surface shows an alternation of low hills and open valleys. The woodland region of the Norman Bocage, in the Department of Calvados, attains an elevation of 1000 feet in a few places, and in the Forest of Ecoves, near Alençon, Mont des Avaloirs rises to a height of 1370 feet.

Corsica, a part of France since 1768, belongs physically to Italy, with which it is united by a submarine plateau. It is traversed from north to south by a mountain range, which descends on the east to a narrow coastal plain, while westward it sends out spurs that project into the sea as promontories inclosing many good harbors. The interior of the island is wild and rugged and is dominated by peaks of considerable altitude, the highest being Monte Cinto, 8900 feet above the sea.

Hydrography The large drainage systems of France are those of the Rhône, the Garonne, the Loire, and the Seine. The northeastern part of the country is included in the basins of the Moselle and the Meuse, which flow northward into Belgium. The Rhône, which in point of discharge is the largest of the rivers, rises in Switzerland and enters France at the gap between the Alps and the Jura, flowing first southwesterly into the Rhodanian depression, where it is joined by its largest tributary, the Saône, from the north, and then sweeping to the south towards the Mediterranean. Through the Isère and Durance it drains most of the Alpine region of France, but has no important branches from the west. The basin of the Rhône covers an area of about 38,000 square miles. The Garonne, the Loire, and the Seine follow the general land slope and drain into the Atlantic. The Garonne, with a basin of 33,000 square miles, rises on the Spanish side of the Pyrenees and flows in its middle course along the southwestern edge of the central plateau, from which it receives the Tarn-Aveyron, the Lot, and the Dordogne. At its mouth it widens to form the estuary of the Gironde. The Loire, the longest of the rivers, drains the great basin of western France, with an area of about 46,000 square miles. It rises on the slopes of Mont Mézenc, in the Cévennes, about 30 miles from the Rhône, and thus crosses the whole breadth of the central plateau. The chief branches of the Loire are on the north, the Mayenne, Sarthe, and Loir, which unite to form the Maine, and on the south, the Allier, Cher, Indre, and the Vienne-Creuse. The Seine collects the waters from the northern part of the central plateau, over an area of about 30,000 square miles. From the north it is joined by the Oise, Marne, and Aube, and from the south by the Yonne and Eure. Besides the four great river systems, there are several minor streams of importance, such as the Somme, Orne, Vilaine, Charente, Adour, Aude, and Hérault, the last two flowing into the Mediterranean. More than 200 rivers are officially reported as navigable, for an aggregate distance of about 6000 miles. Even the largest, however, show such fluctuations in volume between periods of floods and low water that they are not continuously navigable except by light-draft boats. The Seine is most important for commerce, being navigable for river boats beyond Paris. The utility of the natural waterways is much augmented by the extensive systems of canals that connect them, the Seine is connected with the

Meuse and Moselle providing waterways across France to Belgium and Germany, the Seine is also connected with the Loire and Saône, the northwestern seaports of Brest and Saint-Malo are joined by river and canal with the Loire, and the Gironde is extended by canal to the Mediterranean. About one-fourth of France's internal trade is carried on the waterways. There are but few lakes in France. Aside from the blackish or fresh-water lagoons along the coast, the largest are in the Alps within the Rhône Basin. The largest of these, Lake Geneva, belongs only in part to France, the north shore lying in Switzerland. Other well-known lakes of this region are Annecy and Bourget.

Climate The climate varies considerably between the coastal and the elevated interior regions, but it is characteristically temperate. On the Atlantic seaboard the temperatures are equalized by the southwesterly winds from the ocean, towards the interior the extremes of winter and summer are more marked, and the isotherms trend steadily southward. The temperatures at Brest average for the year about 52° F, for January 43° F, and for July 63° F, while at Paris the yearly mean is 50° F, the January average 36° F, and the July average 65° F. On the eastern frontier the climate has a continental character, the winters being long and severe and the summers hot. Thus, at Nancy, which is nearly in the same latitude as Paris, the annual mean is 48° F, the January mean 32° F, and the July mean 65° F. The greatest contrast is exhibited between the bleak climate of the central plateau and the eastern highlands, and the warm, almost subtropical, climate of the Mediterranean coast. The prevailing winds for the most of France are from the south and west, and, as the mountains are on the eastern border, the moist winds are not stopped by any obstacle before they reach the highest summit. The southerly and westerly winds, being warm and moisture-laden, are responsible for the most of the rainfall. A local wind, the "mistral," which descends from the central plateau upon the Mediterranean coast, is remarkable for its constancy and force. At Marseilles it blows on an average 175 days in the year, sometimes with such violence as to overturn railway trains and to denude trees of their foliage. It has a chilling effect, but by clearing the atmosphere it brings sunshine and healthfulness to the region. The rainfall, which averages about 30 inches for the whole country, is greatest along the seacoast, and in the elevated regions of the Cévennes, the Pyrenees, and the Alps, where the annual precipitation usually exceeds 40 inches. The smallest average (10 inches) is found in certain interior districts of the northern plains.

Flora. The flora of France is typical of that of continental Europe, since plants indigenous to each region may be found in some part of the country. Except on the summits of Mounts Cantal and Dore, which were more recently formed than their neighbors, the mountain crests are tipped with species of lichens and mosses peculiar to the Arctic-Alpine regions. With lessened altitude appear species in a succession similar to their sequence in decreasing latitude—mustards, crowfoots, dwarf willows, and birches. With continued descent the trees, shrubs, and herbs characteristic of northern European forests are met with—pine, spruce, ash, beech, and oak. As the level of the sea in

the south of France is approached, species indigenous to that latitude are encountered—chestnut, poplar, mulberry. The products of the northern districts and of the higher elevations are wheat, rye, oats, grapes, apples, and pears, of the middle, corn, potatoes, peaches, apricots, cherries, and strawberries, of the southwestern, grapes, prunes, figs, and various nuts, and of the Mediterranean coast, oranges, lemons, olives, and pomegranates. See DISTRIBUTION OF PLANTS, ECOLOGY, and the paragraph on *Flora in EUROPE*.

Fauna The fauna of France is representative of western Europe. The wide variety of climate and physical features its extensive surface affords gives room and conditions for a great diversity of animal life. A sixth or more of its surface is covered with forests, and lofty mountains, broad sandy plains, and a great length of coast offer suitable homes for representatives of the whole fauna of temperate Europe. Many large quadrupeds have become extinct or have been reduced to a semidomestic condition during the centuries of human occupation. An account of the aboriginal fauna and its partial disappearance is given under **EXTINCT ANIMALS**. Bears still survive in the Pyrenees, and wolves lurk in the forested foothills of the mountains along the Swiss and Italian borders. Wildcats are very rare, but a civet (the genet) and foxes are not uncommon, while several weasel-like carnivores occur widely. The higher mountains contain a few chamois, the moufflon remains in Corsica, and the native wild boar and fallow deer are preserved on many private estates. The porcupine is the most interesting of the many rodents as a survival near the Mediterranean of ancient forms. The birds embrace a very large list, most of which are common to all Europe. Regular routes of migration between northern latitudes and Africa traverse France—one by way of Spain and the Atlantic coast, another across the Mediterranean by way of Sardinia and Corsica, and thence into and beyond France along the valleys of the Rhône, Loire, Saône, and Meuse. Some peculiar southern birds occasionally appear, as the sand grouse, and others are habitually present in the south of France, as the bee eater and hoopoe. The great coast line brings all of the wandering sea animals of the north Atlantic to French shores, which are rich in fisheries, oyster banks, and plantations, and littoral life generally. The Mediterranean gives a separate sea fauna. Among reptiles only the adder, more or less observable everywhere, need be mentioned. Cyprinoids are the most characteristic inland fishes. See **EUROPE, DISTRIBUTION OF ANIMALS**, and articles upon neighboring countries.

Geology. The central plateau is the geological nucleus of France, around which sedimentary strata have been deposited during the Paleozoic and succeeding periods. In this region the rocks comprise granites, gneisses, and schists of Archean character, overlaid in places by later volcanic flows of basalt and trachyte. The northern and western plains were built up during Mesozoic and Tertiary times by sedimentary accumulations along certain lines that correspond generally with the present basins of the Seine, the Loire, and the Garonne. Normandy and Brittany, however, are of more ancient (Paleozoic) formation and resemble in geological structure the southwestern part of England, with

which this portion of France was once united. The bordering highlands were uplifted at different times. The Ardennes and the Vosges consist of early Paleozoic strata, with small areas floored by Devonian and Carboniferous, the latter containing the most important coal deposits of the country. The Jura Range has lent its name to the Jurassic system, which here includes thick beds of limestones and sandstones that are continued eastward into Germany. In the Alps the central granite axis is flanked by Mesozoic strata, upturned and sharply folded. The Pyrenees did not assume their present form until late Tertiary times, when there was an extensive upheaval which parted the waters of the Mediterranean and the Atlantic. Between the central plateau and the eastern highlands an arm of the sea once extended as far north as the Paris basin, its bed was elevated at the close of the Pliocene and has since been occupied by the basin of the Rhône.

Mineral Resources. The coal fields of France, while they are limited to the comparatively small area of about 2100 square miles, are the most valuable of the nation's mineral resources. The deposits are distributed over a number of small areas, including those of Pas-de-Calais (which yielded in 1911 about 51 per cent of the total production), Nord (17 per cent), Loire (12 per cent), and Nivernais (Le Creusot), Gard (Alais), Bourbonnais (Commentry), Tarn, and Aveyron. They furnish a good quality of bituminous coal, suitable for fuel purposes and to a less extent for iron making. Small amounts of anthracite are mined in Isère, and about 700,000 tons of lignite are produced annually, most of it in Bouches-du-Rhône. The annual output of coal in France, including the small lignite production, has gradually increased from 4,481,000 metric tons in 1851 to 13,259,000 tons in 1871, 26,025,000 tons in 1891, 32,325,000 tons in 1901, 39,230,000 tons in 1911, and 41,308,000 tons in 1912. The supply is insufficient for domestic consumption, and about 20,000,000 tons are imported annually (about 16,500,000 tons in 1911 and about 23,400,000 tons in 1912). The 1911 output of coal was valued at the mine at 589,219,000 francs, and of lignite at 7,230,000 francs. The number of workers was 200,212, whose wages amounted to 292,496,000 francs.

The development of manufacturing industries is retarded by lack of fuel and by the high rates of fuel transportation. These conditions have necessitated the extended use of water power, with which the country fortunately is well supplied.

Iron is next to coal in importance. The output of iron ore increased from 1,238,000 metric tons in 1851 to 1,852,000 tons in 1871, 3,589,000 tons in 1891, 4,791,000 in 1901, 8,481,000 tons in 1906, 16,639,000 tons in 1911 (valued at 77,500,000 francs), and 19,160,000 tons in 1912 (92,900,000 francs). Employees numbered 22,674, wages amounted to 36,122,000 francs. Of the total output, 15,054,000 tons, or about 90 per cent, were produced in Meurthe-et-Moselle, which is one of the principal iron-producing regions of the world. The most important departments producing the remaining 10 per cent are Orne, Calvados, and Pyrénées-Orientales. The total output of 16,639,000 metric tons of iron ore in 1911 may be compared with 6,060,000 tons in Luxemburg, 6,154,000 in Sweden, 8,774,000 in Spain, 15,768,000 in the United Kingdom, 23,829,000 in Germany, and 44,600,000 in the United States.

FRANCE

SOUTHERN PART

important towns are shown in heavy face type
Railways shown thus — Canals —

The production of other minerals is comparatively unimportant. The total salt output increased from 811,000 metric tons in 1891 to 910,000 tons in 1901, 1,339,000 tons (valued at 18,800,000 francs) in 1911, and 1,099,000 tons (15,900,000 francs) in 1912. Rock and brine salt amounted to 835,000 tons, and sea salt to 504,000 tons, in 1911, of the total, 742,000 tons, or more than half, were produced in Meurthe-et-Moselle, and 210,000 tons in Bouches-du-Rhône. In 1911 the output of gold ore was 144,000 tons, valued at 7,583,000 francs, zinc ore, 43,761 tons, 5,159,000 francs, iron pyrites, 278,000 tons, 4,697,000 francs, lead and silver ore, 14,098 tons, 2,613,000 francs, antimony ore, 29,267 tons, 1,597,000 francs. Other minerals were of smaller values. The total mineral output in 1911 was valued at 717,593,000 francs, exclusive of the output of the quarries.

In building materials and quarry products generally France is well endowed. In 1911 the value of the product of the quarries, including slate, building stone, cement, etc., amounted to 278,564,000 francs. Marble is quarried in the Alps and Pyrenees, granite, sandstones, and limestone, in numerous localities. The French millstones, celebrated for their good quality, come from Ardèche. The value of the roofing slates, mostly from the Ardennes, is second only to that of the output of Great Britain. Phosphate rock, used in the manufacture of fertilizers, is quarried in the departments of Meuse and Pas-de-Calais. Large quantities of this material are mined by French companies in Algeria and shipped to France for manufacture.

The mineral springs of France are numerous and of varied character. They are situated mostly in the mountain district of Auvergne and in the regions bordering the Alps, Vosges, and Pyrenees. Places well known for their baths and medicinal waters are Aix, Aix-les-Bains, Enghien, Bagnères-de-Bigorre, Bagnères-de-Luchon, Bagnères, Vichy, Dax, Plombières-les-Bains, Bourbonne-les-Bains, Bourboule, Forges-les-Eaux, and Saint-Sauveur.

In the manufacture of iron and steel France is surpassed only by the United States, Germany, and the United Kingdom. The output in France has increased notably since about the beginning of the present century. In 1880 pig iron was produced to the amount of 1,725,000 metric tons, and worked iron and steel, 1,354,000 metric tons, in 1890, 1,962,000 and 1,407,000, in 1895, 2,004,000 and 1,472,000, in 1900, 2,714,000 and 1,935,000, in 1905, 3,077,000 and 2,112,000; in 1910, 4,038,000 and 2,850,000, in 1911, 4,470,000 and 3,220,000. Not included in these figures is the production of steel ingots, etc., which in 1910 amounted to 3,839,000 and in 1911 to 4,032,000 metric tons. Of the pig iron, 3,012,000 tons were produced in Meurthe-et-Moselle, of the worked iron and steel, 973,000 tons in Meurthe-et-Moselle and 861,000 in Nord. The value of the pig iron produced in 1911 was 339,136,000 francs, of the worked iron and steel, 556,689,000 francs, of other metals, 99,759,000 francs. It is evident that in the production of metals other than iron and steel France is not prominent. In 1911 the output included 2726 kilograms of gold (valued at 9,389,000 francs), 47,277 kilograms of silver (5,295,000 francs), lead, 23,635 metric tons (8,925,000 francs), zinc, 57,110 tons (35,192,000 francs), copper, 13,237 tons (19,765,000 francs), nickel, 1880 tons (6,580,000 francs), aluminium, 7400 tons (11,596,000 francs); antimony (regulus and oxide), 4775 tons (2,496,-

000 francs). Employees in the manufacture of pig iron in 1911 numbered 101,538, worked iron and steel, 82,866, other metals, 5868.

Fisheries. The fishing industry is on a large scale. The following figures are for 1909 and 1910 respectively: fishermen, 159,899 and 128,869, sailboats, 29,598, of 196,707 tons, and 28,288, of 206,129 tons, steamers, 269, of 35,807 tons, and 454, of 38,000 tons, value of sailboats, 56,843,000 and 51,933,000 francs, value of steamers, 27,716,000 and 23,945,000 francs, value of the catch, 134,866,000 and 140,288,000 francs. In 1910 the catch of cod amounted to 75,542 metric tons, valued at 31,915,000 francs (of which 63,890 tons, 25,222,000 francs, on the Newfoundland Banks), sardines, 26,390 tons, 13,397,000 francs, herrings, 45,949 tons, 11,269,000 francs, mackerel, 14,046 tons, 7,018,000 francs, tunny and dolphin, 8201 tons, 5,518,000 francs, lobster and sea crayfish, 1408 tons, 3,435,000 francs, oysters, 779,000 francs.

Agriculture. Its geographical position, fertile soil, and mild climate combine to make France an agricultural country. Agriculture has been the chief occupation of its inhabitants for centuries, and the French peasant and landlord have been distinguished for their quickness in adopting improved methods of cultivation following the discoveries of science. The total active population in 1906 was returned at 20,720,879, of whom 8,777,053 were engaged in agriculture. The most fertile sections of the country are in the north and northeast and along the valleys of the Garonne and Rhône. The least productive are the marshy *landes* of the southwest and the mountain regions of the Pyrenees and Alps. The cultivation of cereals, wine production, and cattle raising are the principal branches of agriculture. In 1911, out of a total of 52,920,208 hectares, as reported, 23,752,240 hectares were under the so-called great crops and in sown meadow and fallow, 4,905,670 in natural meadow, 1,526,560 under forage grasses, 3,664,380 in pasture, 1,664,880 under vines, 1,083,990 in market gardens, shrubberies, etc., 9,339,319 in forest, 3,885,220 uncultivated, and 2,861,069 in various uses not included in the foregoing.

Cereals.—In 1912, upward of 13,600,000 hectares, or more than one-fourth of the total area of the country, were under cereals, in the production of which France stands, among European countries, second only to Russia. Nearly one-half of the cereal area is devoted annually to the production of wheat. In some European countries the trend of the population cityward, American and Canadian competition, and other causes have combined to curtail wheat cultivation; but this condition is barely noticeable in France. In 1871, 6,423,000 hectares were under wheat, in 1901, 6,794,000, in 1913, 6,543,550. Under oats in 1871 were 3,397,000 hectares, in 1901, 3,856,000, in 1913, 3,998,820. Wheat is largely raised in the north, in the west, in the central parts, and in the basin of the Garonne. Previous to 1860 rye bread was the staple food of the peasantry, but after that time they began to discard rye for wheat, so that the people now, though consuming much rye, are pre-eminently a nation of wheat eaters.

Next to wheat in importance is oats, to which 3,397,000 hectares were planted in 1871, 3,856,000 in 1901, and 3,982,000 in 1912, more than one-fourth of the cereal area being devoted to this crop. In the area under oats France ranks

third in Europe, being exceeded by Russia and slightly by Germany

The table below shows area and production of cereal crops in 1911 and 1912, with metric quintals produced per hectare in 1912

	Hectares		Quintals		Qs per ha
	1911	1912	1911	1912	
Wheat	6,443,360	6,571,580	87,727,100	90,991,500	13.84
Meslin	127,270	128,750	1,541,220	1,554,620	12.07
Rye	1,174,420	1,201,630	11,875,000	12,382,200	11.05
Barley	771,935	759,630	10,856,570	11,014,200	14.49
Buckw't	480,940	461,230	2,160,190	5,006,940	10.85
Oats	3,991,490	3,981,980	50,693,500	51,541,600	12.94
Corn	404,550	476,480	4,282,700	6,028,680	12.65
Millet	21,435	21,170	125,010	154,555	7.30

Fruit and Vine Growing—France is famous for her fruit and especially for the product of her vineyards. Apples, plums, pears, peaches, and cherries abound in the north and central parts of the country, while the orange, lemon, and olive thrive in the south. Nuts also grow in great abundance. The most important of the nuts is the chestnut, the annual value of which is the largest single item in the revenue of the French nut growers. It grows on the poorer lands of the country and in the mountainous regions of Auvergne and Corsica and constitutes a staple food of the inhabitants. The vine has from a very early period constituted one of the principal sources of the agricultural wealth of France. The mild climate and the soil of the country are especially adapted to its cultivation. The choicest grapes are grown in Champagne, Burgundy, and the region of Bordeaux, but some excellent kinds are produced on the banks of the Loire and in some of the southern departments. The area devoted to this culture increased from 2,003,000 hectares in 1830 to 2,429,000 in 1872 and 1873, and then decreased to 1,609,000 hectares in 1900, 1,618,000 in 1910, and 1,551,000 in 1912. The vine culture has from time to time received serious checks through attacks by the fungus known as the *oidium*, which inflicted such serious damage that in 1854, the worst year, the hectare yielded only 4.97 hectoliters. Another destructive disease is caused by the ravages of an insect known as *Phylloxera vastatrix*.

The damage wrought by these diseases is shown by the fact that the average yield per hectare, which rose to 20.75 hectoliters in 1850, began to decline after that year. It advanced to 24.69 hectoliters in 1858, 35 in 1875, 37.11 in 1901, 40 in 1907, and 37 in 1908, but these were exceptionally good years. In 1878 the French government took the first step to combat the evil. By a series of legislative enactments calculated to encourage a war of extermination against the insect, the government finally succeeded to a great extent in overcoming the pest. The most effective means of overcoming the ravages of phylloxera was the importation of American vine stock upon which the French vines were grafted. The following figures illustrate the progress of the wine industry in the nineteenth century and during the opening years of the twentieth century. In 1829 there were produced 31,000,000 hectoliters, in 1849, 35,600,000, in 1880, 29,700,000, in 1890, 27,400,000, in 1900, 67,400,000, in 1905, 56,700,000, in 1910, 28,500,000; in 1912, 59,400,000. The production of cider in 1904 was 41,000,000

hectoliters, and in 1905 only 4,800,000, in 1910, 12,300,000, and in 1912, 17,700,000.

Live Stock—Stock raising is of secondary importance in France, domestic stock being far from sufficient to meet the home demand. There were 14,706,000 cattle in 1912, as compared with 14,521,000 in 1900 and 13,633,000 in 1890. The cattle in 1912 included 7,745,750 cows, 2,842,710 young stock, 1,844,790 steers, 283,670 bulls, and 1,988,980 calves. The dairy industry flourishes, especially in the north, where the products are exported to England. Horses are raised principally in the north and west. The raising of fine breeds is an object of special care on the part of the government in the interest of the army. The number of horses has been nearly stationary since 1862, in that year there were on farms 2,914,000, in 1880, 2,849,000, in 1900, 2,903,000, in 1912, 3,222,000. Sheep breeding is important. However, in spite of the efforts of the wool growers, the number of sheep declined from over 32,000,000 in 1842 to 29,500,000 in 1862, 23,800,000 in 1882, 20,200,000 in 1900, 17,954,230 in 1903, and 16,467,700 in 1912, a decline which had to be covered by importations. The number of hogs, which increased to 7,421,000 in 1892, declined to 6,740,000 in 1900 and 6,903,750 in 1912. The best breeds are raised in Champagne and the Pyrenees. Importation is necessary to meet the home demand. Goats, mules, and asses are among the animals of the French peasant. In 1912 there were 1,408,520 goats, 358,660 asses, and 196,410 mules. Apiculture is well developed.

Industrial Plants—Beets owe their importance to the manufacture of beet sugar, which originated during the early part of the nineteenth century. During the prevalence of the vine disease, beets were employed in the manufacture of alcohol. The cultivation is carried on chiefly in the north and east, the area was 255,170 hectares in 1912, and the production 72,221,045 metric quintals. Hemp and flax are grown chiefly in the north. The cultivation of the mulberry tree for silk production was introduced in the reign of Henry IV (1589-1610). This industry receives assistance from the government and is carried on chiefly in Drôme, Gard, Audeche, Hérault, and Vaucluse. Notwithstanding the large premiums, however, the number of sericulturists is decreasing. In 1903, 120,266 persons were engaged in silk culture, and, in 1912, 99,360. For years after 1860 the production increased, though it has always fallen far short of 1850, when 25,000,000 kilograms of cocoons were produced. The average of the last decade of the nineteenth century was 8,000,000 kilograms of cocoons, or 2,000,000 kilograms of raw silk. In 1903 the production of cocoons had declined to 5,985,481 kilograms and in 1910 to 4,269,790, in 1912 it rose to 6,233,942, but in 1913 dropped again to 4,417,426. Of the other industrial plants, tobacco and colza are the most important. Potatoes and mangold are important crops, as also are beets (other than sugar beets). Tobacco production, manufacture, and sale are a government monopoly and a source of large revenue. Production restricted to 25 departments is controlled by the state. In 1912 there were 1,563,530 hectares planted to potatoes, yielding 150,251,530 metric quintals.

Land Tenure—France is a country of small farms, the inheritance laws having contributed to the extreme parcellation of the agricultural land. According to the latest available esti-

mates there are about 3,000,000 holders of farms below 25 acres, while those whose farms are not larger than $2\frac{1}{2}$ acres exceed 1,000,000 in number. About 20 per cent of the cultivated area is in farms under 25 acres, and nearly one-half the cultivated or pastured area is in farms of less than 100 acres. There are, however, many large estates, recent estimates indicating that farms or estates of over 400 acres occupy more than one-fourth of the area. About 80 per cent of the holdings are occupied or cultivated by the owners. Of the 53,000,000 hectares of land in France about 25,000,000 were, in 1910, under great crops and sown meadows, 5,000,000 natural meadows, 5,000,000 pasture and forage grasses, 1,500,000 in vineyards, and nearly 10,000,000 in forests. Market gardening is an important agricultural industry in the vicinity of Paris, and the market gardeners have a high reputation for their skill in this line.

Beet Sugar—About 6,000,000 acres of land in France are devoted to the production of sugar beets, and the quantity of sugar produced is about 600,000 metric tons annually. France holds fourth rank among the countries of the world in the production of beet sugar, being exceeded by Germany, Russia, and Austria-Hungary. The chief production is in the northern part of the country. The number of men engaged in the sugar industry is about 35,000.

Forests—The principal forest trees are the chestnut and beech in central France, the oak and cork tree in the Pyrenees, and the fir in the Landes. The pinaster is extensively cultivated along the southwestern coast on account of its usefulness in reclaiming the low seacoast and because of its rich yield of turpentine. The destruction of the national forests has been enormous within the last two centuries, but measures were taken as early as 1827, and especially in recent years, to plant new woods in order to protect those mountain slopes which are exposed to inundations from Alpine torrents. The forests of France embraced, in 1911, 9,339,319 hectares, slightly more than one-sixth of the total area of the country. Nearly two-thirds of the area under forests is in private hands, while one-third is in the hands of the national, departmental, and communal governments.

Agricultural Education—The betterment of agricultural conditions in France is elaborately provided for by the National Department of Agriculture. This department has established under one central authority a much more comprehensive and closely coordinated system of agricultural education than is known in America. The schools are adapted to local needs. Not only is instruction in agriculture a branch of the general course in the public schools, but there are practical schools of apprenticeship especially for the training of the peasant laboring class. A professor of agriculture is assigned to each department, and conferences are given in the important agricultural communities.

Manufactures For centuries France held a preeminent position as a manufacturing country. The fame of French industry was due to the skill of her craftsmen, which was developed through generations. But with the advent of modern industrial appliances, the conditions for the success of which are not so much technical skill as an abundant supply of raw material, especially coal and iron, France was at a disadvantage. Not possessing the natural resources

which insure cheap power and industrial operations on a large scale, the country has been handicapped in the international contest for the world's markets, though in recent years the use of electricity generated from water power has proven of material assistance to her industries. The manufactures which are most successfully produced are largely confined to those industries or branches of industries whose products are noted for their superior artistic finish, and they do not directly compete with British, American, or German manufactures in the world's trade. The more important industries are the textile, metal, paper, chemical, glass and pottery industries. Several other branches of French manufacture are famous for the elegance and beauty of their products, but they are of minor importance from the point of view of net financial returns. Such are the glove industry of Grenoble and Paris, the Gobelins tapestry, costly shawls, watches, clocks, articles of virtu, carriages, scientific instruments (manufactured mostly in Paris), the matchless china and glass of Sevres, the fine furniture of Paris and Bordeaux, and many other articles of comfort and luxury. The textile industry is by far the most important, the annual output being valued at about \$750,000,000. This includes woolen, cotton, silk, and linen manufactures, enumerated in the order of the value of their products. The woolen industry employed in 1906 171,000 people in more than 2000 mills, turning out about \$260,000,000 worth of goods per annum. It is carried on chiefly in the departments of Nord, Ardèche, Marne, Somme, Aisne, and Tarn. The more costly of the products of the industry, such as the Paris and Lyons shawls, the Rouen, Roubaix, and Sedan cloths, are in demand all over the world. While exporting enormous quantities of woolen goods, France has to import a good deal of raw wool, owing to the decline of the domestic output. The cotton industry, centering chiefly in the departments of Nord, Vosges, Eure, Aube, and Seine-Inférieure, employed about 150,000 persons at 5,200,000 spindles and 95,000 looms in 1900, as compared with about 100,000 persons and 4,376,000 spindles in 1890, in 1906, 167,000 persons were employed, and the number of spindles rose to 7,400,000 in 1912. The industry dates in France from 1773. Its annual output is valued at over \$120,000,000. The silk industry, while ranking third in the value of its output, excels in the artistic finish of its products. The annual value of these is estimated at about \$110,000,000 for Lyons and Saint-Etienne alone. This industry employed about 124,000 persons in 1906. Hand-loom weaving is rapidly declining, the chief seat of this house industry is in the Department of Rhône. In the production of linen goods France leads in the matter of style, quality, and design. The linen industry flourishes chiefly in the north, the names of Lille, Cambrai, and Valenciennes having become identified everywhere with the finest qualities of linen. No less famous are the lace manufactures of Paris, Saint-Etienne, Lyons, and Nantes.

The metal industry is next in importance. While there are large iron and steel mills in the mining region, the departments of Nord, Meurthe-et-Moselle, Loire, and Pas-de-Calais, France is far behind such countries as the United States, Great Britain, and Germany in that field and has to resort largely to imports

of machinery. It is known, however, for the fine qualities of its smaller metal ware, such as safes, hardware, steel pens, locks, files, needles, etc. The excellence of French gold and silver ware is a matter of common knowledge. The manufacture of jewelry, watches, and optical instruments deserves mention. At the opening of the twentieth century the paper industry engaged about 40,000 people in 600 paper mills, producing some \$60,000,000 worth of goods annually. In 1885 the number of mills barely exceeded 500 employing about 30,000 workmen and turning out products valued at but \$23,000,000. The manufacture of pottery furnished employment to some 166,831 people in 1906. In addition to the superb china and porcelain ware of Sèvres there should be mentioned the famous mirror works of Saint-Gobain and Montluçon, and the imitation jewels and glass prisms. The chemical industry ranks probably next to that of Germany, the more important branches from a commercial point of view being the manufacture of perfumes, soap, and candles. Beer brewing is increasing in importance, the consumption of beer growing at the expense of wine, especially by the poorer classes. From about 8,227,000 hectoliters in 1880, the production of beer rose to over 10,712,000 hectoliters in 1900, 12,239,000 in 1910, and 14,650,000 in 1911. The production of wine has kept pace with vine growing, and French cognac still leads the world. In 1899-1900 there were produced 869,201 metric tons of refined sugar, this increased to 1,051,931 tons in 1901-02, but declined to 562,736 tons in 1904-05, the production in 1905-06 was 984,672 tons, in 1910-11, 650,488, in 1911-12, 465,378, and in 1912-13, 877,656. In 1905, 2,608,626 hectoliters of alcohol were produced, and, in 1912, 3,309,609 hectoliters. The growth of large modern industries may be best seen from the increased use of steam power, e.g., in 1840 the engines and motors employed in the industrial establishments of France, not counting the railways, numbered 2591, with 33,000 horse power, in 1890 the horse power exceeded 863,000, in 1900, 1,791,000, in 1910, 2,913,000, and, in 1912, 3,225,000, the total number of engines in the latter year being 81,675.

Transportation. In length of railway, France is fifth among the countries of the world. The table below compares the length of the French railways, in kilometers, with that of other leading countries at the end of 1890 and at the end of 1911, the table shows also the number of kilometers for each 100 square kilometers of territory and for each 10,000 inhabitants (the kilometer equals 0.62137 mile)

COUNTRY	Kilometers		Km per 100 sq km		Km per 10,000 pop	
	1890	1911	1890	1911	1890	1911

* European Russia, including Finland. † At end of fiscal year

The average length of railway in exploitation in France during 1911 was 49,980 kilometers (31,056 miles), of which 40,635 kilometers were comprised in the lines of general interest and 9345 kilometers in the lines of local interest. The average length of railway of general interest in operation in 1841 was 499 kilometers, in 1850, 2915, in 1860, 9167, in 1870, 15,544, in 1880, 23,089, in 1890, 33,280, in 1900, 38,109, in 1905, 39,607, in 1910, 40,484, in 1911, 40,635, in 1912, 40,854 (provisional). The average length of railway lines of local interest in operation in 1880 was 2105 kilometers, in 1890, 3015, in 1900, 4575, in 1905, 6868, in 1910, 8714, in 1911, 9385 (provisional), in 1912, 9925. From the foregoing figures it may be seen that the combined average length of railway in operation increased from 25,194 kilometers (15,655 miles) in 1880 to 36,295 in 1890, 42,684 in 1900, 49,198 in 1910, and 50,779 (31,553 miles) in 1912.

The average length of railway in operation in 1910 was comprised as follows: I The great systems. State lines, 8925 kilometers (including 2967 in the old system and 5958 in the Western Railway system, which was transferred to the state Jan 1, 1909), the lines of the great companies, comprising the Northern Railway system, 3803 kilometers, Eastern Railway system, 4939, Paris-Orléans system, 7744, Paris-Lyons-Mediterranean Railway system, 9562, Southern Railway system (Midi), 3892, other, 158, total, 30,098 kilometers. II Secondary systems, 1461 kilometers. Total railway of general interest, 40,484 kilometers. III Railway of local interest, 8714 kilometers. Grand total, 49,198 kilometers. In addition there were tramways aggregating 5895 kilometers and the Paris-Metropolitan of 59 kilometers.

The great railway systems, with one exception, converge upon Paris, these systems are six in number, excluding the old state lines and including the Western system, now taken over by the state. A thorough grasp of these is essential to a clear understanding of the principal economic divisions of the country and their effect upon its industrial and commercial development. These lines, as mentioned above, are the Northern, the Eastern, the Paris-Lyons-Mediterranean, the Southern, the Paris-Orléans, and the Western.

The most important is the Paris-Lyons-Mediterranean Railway, running, with its numerous branches, through the richest section of France and connecting the two largest cities of the country, Paris and Marseilles. It commands the traffic of the Rhône valley as well as that going to and from Switzerland, Italy, and southern Germany. Its paid-up capital at the end of 1910 was 4,831,273,328 francs.

The Paris-Orléans Railway extends beyond Orléans to the west and south through Tours to the ports of Nantes and Bordeaux and has its southern terminal at Toulouse, where it joins the Southern Railway. It passes through a rich agricultural country, serving as an outlet for its products, which it takes to the Atlantic ports just mentioned, to the Mediterranean through the Southern Railway, and to Paris and the northern region of France. Its paid-up capital at the end of 1910 was 2,549,191,025 francs. The Southern Railway is the only trunk road that does not terminate in Paris. It traverses the south of France from east to west, joining the two roads just described. The principal

terminals of the line are Bordeaux, on the Atlantic, and Cette on the Mediterranean. At the latter point it joins the Paris-Lyons-Mediterranean line and connects at Perpignan and Bayonne with the railways of Spain. Its paid-up capital at the end of 1910 was 1,392,517,683 francs. The Northern Railway, extending from Paris northeast to the Belgian frontier and northwest to the ports situated on the English Channel, passes through the richest mining region of France. It handles the traffic with England and northern Europe and has terminals in the ports of Dunkirk, Calais, and Boulogne, besides passing through the important textile centres of Lille, Cambrai, Valenciennes, Arras, etc. Its paid-up capital at the end of 1910 was 1,762,069,513 francs.

The Eastern Railway covers the territory lying between the Northern and the Paris-Lyons-Mediterranean systems. It is of great strategic value, since it extends directly east of Paris towards the German frontier. Though not connecting the same terminals, it competes with the two systems mentioned above, since it carries traffic to Belgium and northern Germany over Mézieres, to Switzerland over Belfort, and to southern Germany over Nancy. Its paid-up capital at the end of 1910 was 2,153,885,723 francs. Finally, the Western Railway (taken over by the state in 1909), extending from Paris over the northwestern and western parts of France, terminates in a number of ports on the English Channel and the Atlantic, notably Dieppe, Havre, Cherbourg, Saint-Malo, and Brest. It is in a position to compete with the two adjoining roads—the Northern on the northeast and the Paris-Orléans on the southwest. Its paid-up capital at the end of 1910 was 2,088,113,534 francs. The state railways, exclusive of the Western, cannot be said to form a system, since they are not all contiguous, but form an irregular, broken net, intersecting at many points the other roads. The great railways of France will thus be seen to cover each a distinct territory, distinct both in the sense that each territory is traversed by one system only and that each forms a distinct economic entity. The Northern Railway may be called a coal-carrying line, the Paris-Lyons-Mediterranean a carrier of finished products, and the Paris-Orléans a grain carrier.

The operation of government and private railways side by side is the result of a long series of experiments. Since 1842, when the first law regulating the construction and operation of railways went into effect, the country has passed through a number of stages, each having its effect on the railways. The present status is the result of the Law of 1883, which left the principal lines in private hands, but under strict government control, and of the laws of 1908 whereby the Western was taken over by the state. According to the charters of the railways, their franchises expire between 1950 and 1960, when the entire railway property will pass to the state without any compensation. The government, in 1883, turned over nearly all the lines to private companies without any compensation. New construction is done by the government, the companies being assessed for the purpose 25,000 francs per kilometer, a little over \$8000 per mile, about one-tenth of the actual cost. For the remainder the companies advance the money to the government, which the latter pays out in annuities at a certain

rate of interest, after deducting the amounts due to it for sums advanced to the railways for the payment of dividends. The state guarantees a minimum dividend to the stockholders. In the event of inability of a road to declare the minimum dividend on the capital stock, the state advances the required sum, which, with the accrued interest, goes to make up the debt of the road to the state, payable from the profits of succeeding years. When the profits exceed a certain rate, the government receives two-thirds of the surplus. In 1911 the total receipts of the roads of general interest was 1,901,088,000 francs, expenses, 1,188,404,000, net receipts, 712,684,000.

Roads. The French highroads have world-wide fame. The laying of the first is attributed to Philip Augustus, and their more perfect organization during the sixteenth and seventeenth centuries was due to Henry IV and Louis XIV. These roads are divided into three kinds—national, departmental, and communal. The national roads in 1911 had a length of 38,239 kilometers.

Commerce. The general commercial policy of the French government was that of protection during the entire nineteenth, and has continued to be protective in the twentieth century. The unfortunate condition in which France found herself after the War of 1870-71 demanded higher tariff duties for fiscal purposes, but owing to existing treaties with other countries, they could not be introduced before 1882, when a new general tariff was adopted, raising the duties about 25 per cent. Treaties for a term of 10 years terminating in 1892 were entered into with most of the European countries, of which Germany, Russia, Turkey, and Rumania enjoyed the privilege of the "most favored nation" clause. Subsequent changes in the tariff have been designed to make it more prohibitive. The development of the French foreign trade is shown in the table below, in millions of francs; the table shows the general commerce and the special commerce, and the special commerce is discriminated into the three great classes of food products, raw materials, and manufactured goods, bullion and specie are not included, postal packets are included with manufactured goods.

Both imports and exports have shown a substantial increase, although the tariff crippled the import trade for many years subsequent to 1880. The exports during these years would have increased more rapidly had it not been for the retaliatory commercial restrictions imposed by other countries. The dependence of France upon foreign countries for her supply of raw material (including coal) is shown by the fact that in 1912 this constituted about 58.5 per cent of the total imports, while manufactured products amounted to only 19.6 per cent. As explained above under *Manufactures*, because of the different nature of the products, France does not compete with Great Britain, the United States, and Germany in the world's trade, where the demand is largely for cheap machine-made goods. As France sells a large proportion of expensive goods, and buys great quantities of cheap, bulky raw materials, vessels in the French trade often find it difficult to get full return cargoes from French ports.

The chief articles of import in the special trade in order of their importance in 1911 were as follows (values in millions of francs):

cereals, 715 1, wool, 628 2, cotton, 558 7, coal, 453 5, oil seeds, 371 7, hides and skins, 355 0, silk, 317 4, wine, 301 5, machinery, 286 7, rubber, 237 8, timber, etc., 193 3, coffee, 144 4, copper, 143 3, ores, 113 4, flax, 85 9, jewelry, 82 4, petroleum, 81 4, butter and cheese, 81 1, metal wares, 77 4, pottery and glass, 76 7, nitrate of soda, 76 3, paper, 74 8. The leading articles of export in the special trade in 1911 hides and skins, 349 3, cotton tissues, 334 2, wool, 323 6, silk tissues, 292 0, lingerie, 197 7, woolen tis-

542 6 and 1024 2, Russia, 443 1 and 53 9, Algeria, 425 6 and 489 9, British India, 360 2 and 42 7, Argentina, 353 8 and 170 4, Spain, 230 5 and 135 6, China, 229 8 and 13 7, Italy, 190 3 and 277 8, Rumania, 175 1 and 10 7, Brazil, 146 0 and 78 5, Switzerland, 140 2 and 394 0.

Shipping and Navigation The French merchant marine increased from 15,585 vessels, of 1,037,726 tons net, with 91,506 men, at the end of 1900, to 17,729 vessels, of 1,462,639 tons net, with 98,226 men, at the end of 1911. At

1911	115,414,784	135,271,648
1913	136,877,990	146,100,201
1914	141,446,252	159,818,924

In 1911 imports of merchandise from, and exports of merchandise to, foreign countries were valued at 7,136,774,000 and 5,201,071,000 francs respectively, free zones, etc., 29,152,000 and 77,971,000, French colonies and protectorates (including Algeria), 899,902,000 and 797,817,000, totals, 8,065,828,000 and 6,076,859,000. In 1911 imports of merchandise from, and exports of merchandise to, the United Kingdom were valued at 994 2 and 1219 9 million francs respectively (special trade). Germany, 979 7 and 794 6, United States, 826 8 and 379 7, Belgium,

the latter date there were 15,949 sailing vessels, of 624,521 tons, and 1780 steamers, of 838,118 tons, of the total, 15,064 vessels, of 1,07,188 tons, were under 30 tons each. In 1911 there entered at French ports, in the foreign trade and the deep-sea fishing, 30,615 vessels, of 30,483,408 tons (of which, 8046 vessels, of 7,266,870 tons, French), and cleared 31,013 vessels, of 30,882,743 tons (8244, of 7,478,433 tons, French). In combined tonnage, entered and cleared, the principal ports ranked as follows in 1911: Marseilles, Havre, Cherbourg, Bordeaux, Boulogne, Dunkirk, Rouen, Cette, La Rochelle, Saint-Nazaire, Nantes, Calais. The merchant marine receives an annual government subsidy of about \$5,000,000. An important means of inland transportation is afforded by river and canal. Principal water lines in 1911 totaled 6036 kilometers, and secondary lines 5318 kilometers, there was steam navigation on 2563 kilometers of canal and 2542 kilometers of river.

Weights, Measures, and Money The metric system is the only one used throughout the country and its dependencies. There is theoretically a double monetary standard, silver being given an arbitrary value in proportion of 15½ to 1 of gold. But practically the standard of value is gold, there is no free and unlimited coinage of silver. By the agreement of the Latin Monetary Union, which embraces besides France the countries of Belgium, Italy, Switzerland, and Greece, the coinage of silver in each of these countries is limited. For France the Convention of 1897 authorized an issue of 394,000,000 francs. The monetary unit is the franc, usually regarded as equal to 19 3 cents in United States money, the par value is 19 295 cents. The franc has 100 centimes. The coins in use are the 10 and 20 franc gold coins, the silver coins of 1, 2, and 5 francs and of 20 and 50 centimes; and the bronze 5 and 10 centime coins.

Banking The French banking system has in many respects served as a model for other nations. Of late years banking and financing operations generally have acquired a greater relative importance in the economic activity of the country than before, since through that channel the surplus capital of French citizens is directed into productive fields in foreign countries. With the exception perhaps of England, France holds the leading position in the world for the amount of foreign investments. There are two distinct classes of financial institutions to be considered here: (1) the Bank of France, which stands by itself and (2) other banking institutions. The Banque de France is a private institution, managed under strict government control, owing to the important government functions intrusted to it. This control is exercised not only by general legislative provisions, such as govern all other banks, but also directly through the governor and undergovernors of the bank, who are appointed by the government. The governor can exert a veto power over the actions of the bank by refusing to sign the decisions of the General Council, which represents the stockholders. In addition to its general banking function, such as receiving and lending money and keeping accounts with private individuals, the bank conducts all the money operations of the public Treasury and has the sole power of issuing paper money. It was founded in 1800 and was reorganized upon a firmer basis in 1806, it passed through many changes, following the stormy events of the nineteenth century. Its present form of organization and basis of operation date from the charter of 1857, renewed in 1897 and expiring in 1920. The maximum issue of paper money is limited to 5,000,000,000 francs. The state regulates, through the veto power of the governor, the ratio of metallic reserve to the notes in circulation. In return for the privilege of the exclusive power of note issue and of being the depository of all the public funds, the bank performs gratis all the fiscal services in connection with the keeping, transferring, and disbursing moneys on behalf of the Treasury. In addition to that it keeps open to the state at all times a credit of 180,000,000 francs, free of interest or any other charges. In addition to all taxes to which other banks are subject, it pays a stamp tax on the note circulation. On Jan. 2, 1914, the principal resources and liabilities of the bank were as follows: Cash, 4,146,261,059 francs of which 3,507,000,000 were gold, and 640,000,000 silver, portfolio, 1,980,667,000 francs, advances, 1,001,829,000 francs, capital and reserves, 256,000,000 francs, notes in circulation, 6,034,624,735 francs, accounts current (deposits), 692,612,354 francs.

The other principal banking institutions are the Cr dit Foncier, capital stock, on Jan. 1, 1908, of 200,000,000 francs, Cr dit Lyonnais, 250,000,000 francs, Banque de Paris et de Pays-Bas, 75,000,000 francs, and a number of banks with a capital of less than 75,000,000 francs. The Paris Clearing House (*La Chambre de Compensation des Banquiers*), unlike the New York or London houses, plays an insignificant r le. It was founded in 1872 after the London model and, although much had been expected of it, has not proved a success, owing to the reluctance of the French people to use checks. The use of checks is limited to very

large transactions and even in those cases is not always the rule. Savings banks thrive and flourish in France in great numbers. The first savings bank was established in Paris in 1818, in 1840 there were 430 such institutions, with deposits exceeding \$38,000,000, and on Jan. 1, 1913, the private savings banks held deposits exceeding the sum of \$754,000,000, credited to 8,391,000 depositors. In addition to that 5,971,000 depositors had \$329,000,000 in the government postal savings banks. The latter were founded in 1881.

Finance The characteristic features of French finance are the largest public debt of any nation in the world, great and rapidly growing expenditures, and heavy taxation, which nevertheless frequently leaves a large deficit, leading to fresh borrowings.

Revenue—The revenues of the Republic are derived from two sources, taxation and state properties and monopolies. The financial system resembles more that of the United States, differing greatly from those of the United Kingdom and Germany in the great preponderance of indirect over direct taxes. Only about one-fifth of the revenue derived from taxation comes from direct taxes, and four-fifths from indirect. The revenue derived in France from all kinds of taxes constitutes nearly 70 per cent of the total, the remainder being the income from government properties, monopolies, etc. The more important of the direct taxes are those on real estate, personalty, doors and windows, property in mortmain, and the royalties from mines, trade licenses, and such objects of personal use as carriages, horses, bicycles, etc. Among the indirect taxes the most important are the registration tax, contributing nearly one-third of the total revenue from indirect taxes, customs duties, yielding nearly one-fourth, the tax on sugar, nearly one-fourteenth, stamps, with over one-tenth of the total indirect revenue, and a large number of excise duties on various articles of consumption, such as liquors and wines, salt, candles, vinegar, the tax on railway tickets, etc. When we bear in mind that the incomes from a number of the state monopolies are practically indirect taxes, as, e.g., in the case of tobacco and matches, it becomes apparent that the French consumer is heavily taxed on nearly everything he eats, drinks, wears, and enjoys, the department and common taxes cover nearly everything that the national government omits. The most important revenues from government monopolies, in addition to those mentioned, are those derived from state railways, the operation of the mint, public domain and forests. The 1913 budget showed estimated receipts as follows: direct taxes, 622,334,030 francs, indirect taxes, 2,548,755,235, state domains and forests, 67,971,480, state monopolies and industrial enterprises, 968,655,373; various, 428,585,780, total, 4,736,882,438.

Expenditure—The chief item of expenditure is the service of the public debt, which absorbs more than one-fourth of the total revenue of the government. The next largest item is for the Ministry of War, over one-fifth of the total, the Marine follows next, with an expenditure nearly one-half as large, after which come the Ministry of Public Works and the Ministry of Public Instruction, and Fine Arts. The 1913 budget showed estimated expenditure of 4,738,603,534 francs, of which the larger items were as follows: service of the public debt, 1,286,-

423,922 francs, Ministry of War, 983,224,376 francs. Marine, 448,941,062, Public Works, 340,905,255, Public Instruction and Fine Arts, 330,918,486, Interior, 141,961,939. Labor, 106,669,353, Colonies, 105,535,363. The estimated revenues for 1914 were 5,373,517,984 francs, expenditures, 5,373,449,229. The ordinary, extraordinary, and total revenue and expenditure have been as follows, in millions of francs

Year	REVENUE			EXPENDITURES		
	Ord	Extrao	Total	Ord	Extrao	Total
1815	729.2	147.2	876.3			931.4
1820	983.4	5.8	989.2			906.7
1830	971.0	40.0	1,020.1			1,095.1

1850	1,296.5	135.1	1,431.6	1,380.3	92.3	1,472.6
1860	1,722.3	239.9	1,962.2	2,021.8	62.3	2,084.1
1870	1,661.6	1,462.9	3,124.4	1,759.5	1,413.6	3,173.2
1880	2,936.9	573.9	3,530.8	2,826.6	538.0	3,364.6
1890	3,229.4	146.4	3,375.8	3,141.5	146.4	3,287.9
1900	3,814.9		3,814.9	3,747.0		3,747.0
1905	3,766.3		3,766.3	3,706.8		3,706.8
1910	4,273.9		4,273.9	4,321.9		4,321.9
1911	4,689.9		4,689.9	4,547.9		4,547.9
1912	4,857.5		4,857.5	4,742.8		4,742.8

Public Debt—The public debt is the natural result of continued deficits in the national budget and dates from the fifteenth century. In 1913 it was \$6,349,120,000, as compared with \$3,485,818,000 for the United Kingdom, \$4,537,861,000 for Russia, \$2,852,418,000 for Italy, \$1,028,564,000 for the United States, and about \$1,177,418,000 for the German Empire. In 1906 it was \$5,653,134,000. The indebtedness per capita is far beyond that of the principal countries of the world, but is less than that of Portugal, Honduras, and New Zealand. The following table shows at various dates the capital of the public debt (distinguishing the 3 per cent consolidated debt, the railway debt, other debts, and the floating debt), it also shows the annual interest charge on the consolidated debt (all figures represent millions of francs)

YEAR	Consol	Ry	Other	Float	Int
1800	714.0				36.0
1815	1,272.0				64.0
1830	4,426.3			262.5	199.4
1848	5,953.9			630.8	244.3
1852	5,516.2				239.3
1871	12,454.3				386.2
1876	19,909.2			1,359.3	748.3

* Including a few other, small dependencies, as Kerguelen, etc., with 3740 sq km (1425 sq m) and no population reported

Considered from an economic point of view, the French colonial system has gone through four stages since its inception in the sixteenth century. Previous to the Revolution the colonies were administered with a view to the greatest possible profit to the ruling country. In 1825 a change of policy was inaugurated tending to secure to the colonists a large measure of self-government. This condition lasted until 1841, when many of the liberties previously granted were revoked, and a stricter financial control by the government was introduced. In 1854, however, the colonists acquired considerable independence in fiscal matters. While the home government reserves control in some matters, it makes itself responsible for the expenses involved, the most important of which are the support of the army and navy, the salaries of the various government officials, and the maintenance of prisons. The right of the colonists to impose their own tariffs was withdrawn in 1892. The colonial governments, as a whole, are not self-supporting. The dependencies (excepting Algeria and Tunis) in 1911 had an estimated revenue of about 264,000,000 francs, to which a contribution of 103,500,000 francs by the home government was required to cover expenditure. The capital of the colonial debts aggregated 554,372,529 francs on Jan 1, 1912.

As far as the budgets of the colonies themselves are concerned, the colonies are allowed free play in the method of raising their revenue, except the right of fixing the tariff duties, but in the matter of expenses there are certain items, called obligatory expenses, for which each colony must make provision in its budget. The obligatory expenses include, among others, the payment of interest on the debt, the maintenance of the government buildings, a part of the maintenance and salaries for public instruction, police, insane, and poor children. In a work on the French colonial system Professor E. R. A. Seligman of Columbia University, thus sums up the fiscal policy of France towards her colonies. "The French government wavers between two lines of policy. On the one hand, the movement towards local autonomy has granted the colonies substantial rights of fixing their own sources of

revenue and expenditure in accordance with the dictates of local expediency. On the other hand, the movement towards centralization or so-called assimilation has taken away from the colonies the privilege of levying their own tariffs and has imposed upon many of the dependencies a system of taxation more suitable to the interests of the mother country than of those of the colonies themselves, has declared certain of the colonial expenditures obligatory, and finally has complicated the relations between the colonies and the home government by a series of subventions on the one hand and of contingents and contributions on the other. The most recent and enlightened colonial administrators themselves plead, not only for a simplification of the relations between the colonies and the home government, but also for a larger share of independence and initiative on the part of the colonies themselves."

Imports from and exports to the colonies (special trade, excluding bullion and specie) were as follows in 1910 and 1911, in thousands of francs

COLONIES	IMPORTS		EXPORTS	
	1910	1911	1910	1911
Algeria	446,643	425,581	438,930	489,903
Tunis	72,733	79,302	87,247	90,160
Senegal	71,465	45,095	38,967	35,706
Other West Africa	43,021	37,539	23,565	18,604
Madagascar	17,006	25,676	29,897	36,344
Réunion	24,470	27,119	7,514	8,498
India	20,213	24,265	987	1,298
Indo-China	96,001	109,042	64,143	65,791
Martinique	25,096	25,254	12,392	11,942
Guadeloupe	23,841	22,516	11,725	12,427
Others	81,760	58,513	26,132	27,144
Total	922,249	899,902	741,499	797,817

France controls a somewhat larger portion of the commerce of its colonies than the United Kingdom does of the trade of the British colonies. In general, the trade of the more recently acquired possessions is carried on to a smaller extent with France than is that of the older colonies. A large part of the French imports into the colonies is at the expense of the mother country and consists of supplies for the troops and equipment material for various government institutions and undertakings.

Population. The table on page 136 shows by departments the area of France in square kilometers and square miles, the legal population according to the censuses of 1872, 1891, 1901, and 1911 (March 5), the density per square kilometer in 1911, and the living births and the deaths (excluding stillbirths) in 1912.

The density of population in France, 73.82 per square kilometer (191.19 per square mile), compares with that of other countries as follows: England, 258.30 per square kilometer, Belgium, 252.04, Java and Madura, 228.87; Netherlands, 171.36, Italy, 120.94, Germany, 120.04, Austria, 95.24, Switzerland, 91.11, Russian Poland, 74.3 (in 1897), Denmark, 70.75, British India and native states, 68.61, Portugal, 64.80; Hungary, 64.19, Servia, 60.28, Rumania, 55.18, Spain, 38.66, European Russia (without Poland), 19.4 (in 1897); United States, 11.96.

At the beginning of the nineteenth century Russia was the only European country that exceeded France in population. The Russian

dominions are supposed to have had about 45,000,000 inhabitants in 1815. The population of France in 1816 has been calculated at 30,024,000, Germany had in that year 24,833,000, and Italy 18,383,000. At present, among European countries, France ranks fifth in population, being exceeded not only by Russia, but by Germany, Austria-Hungary, and the United Kingdom. An approximate idea of the increase of French population as compared with that of other countries is shown in the following table.

	(1821)	(1861)	(1891)	(1911)
France	30,461,875	37,386,313	38,343,192	39,601,509
	(1820)	(1860)	(1890)	(1910)
Germany	26,294,000	37,747,000	49,428,000	64,925,993
England and Wales	(1821)	(1861)	(1891)	(1911)
	12,000,236	20,066,224	29,002,525	36,070,492
United Kingdom	(1821)	(1861)	(1891)	(1911)
	20,893,584	28,927,485	37,732,922	45,221,615
	(1825)	(1862)	(1911)	
Italy	19,727,000	25,000,000		34,671,377
		(1860)	(1887)	(1910)
Spain		15,673,481	17,565,632	19,555,146
	(1815)	(1859)	(1897)	(1911)
Russia	45,000,000	74,000,000	129,209,297	167,003,400
	(1820)	(1860)	(1890)	(1910)
United States	9,638,453	31,443,321	62,947,714	91,972,266

Among the leading nations France has for many years had the smallest proportionate annual increase. In this connection, however, should be noted the case of Ireland, where the number of inhabitants increased from 6,801,827 in 1821 to 8,175,124 in 1841 and then steadily declined to 4,390,219 in 1911. The calculated population of France in 1700 was 19,669,320, in 1762, 21,769,163, in 1784, 24,800,000. The population for Jan. 1, 1801, was returned at 27,349,003 (or 26,930,756 on the present territory of France), but this figure has been corrected to 27,845,297, in 1821, 30,461,875 (29,871,176 on the present territory), 1841, 34,230,178 (33,400,864), in 1861, 37,386,313 (35,941,902), in 1866, 38,067,064 (36,495,489), in 1872 (after the loss of Alsace-Lorraine), 36,102,921, in 1876, 36,905,788, in 1881, 37,672,048, in 1886, 38,218,903, in 1891, 38,343,192, in 1896, 38,517,975, in 1901, 38,961,945, in 1906, 39,252,245; in 1911, 39,601,509, in 1921 (including Alsace-Lorraine), 39,209,766. The decline in population between the census of 1866 and that of 1872 was 1,964,143, of which 1,597,228 was due to the loss of the territory ceded to Germany. The remainder was due to losses in the war and to an absolute decrease of population in 73 departments. Between 1881 and 1886 there was a loss of population in over one-third of the departments; from 1886 to 1891, 55 departments declined in population, 62 departments decreased between 1891 and 1901, 55 between 1901 and 1906, and 64 between 1906 and 1911. The departments showing an increase in 1911 over 1906 were Alpes-Maritimes, Ardennes, Territory of Belfort, Bouches-du-Rhône, Finistère, Gironde, Indre-et-Loire, Loire-Inférieure, Marne, Meurthe-et-Moselle, Morbihan, Nord, Oise, Pas-de-Calais, Rhône, Seine, Seine-Inférieure, Seine-et-Marne, Seine-et-Oise, Vosges (all of which had shown an increase in 1906 over 1901), and Doubs, Basses-Pyrénées, and Var. The principal cause of the decrease in the 64 departments is stated to be the attraction of the cities. In 1911, communes having upward of 30,000 inhabitants numbered 79, with an aggregate population of 9,053,475, the increase over 1906 being 475,442, while the increase for France as a whole was only 349,242. The 1901 census showed

an increase of 458,376 in communes of over 30,000, and the 1906 census, 226,731. In 1911, as also in 1906, there were 15 cities of more than 100,000 inhabitants. For 1906 the rural population was returned at 22,715,011, and the urban at 16,537,234. As just stated, the urban population is increasing at the expense of the rural, though in general the discrepancy between urban and rural changes in population is not so marked as in Germany. But it must be noted that in certain French departments where the general population is declining the population of their urban centres is increasing. Rural population is that which subsists in communes having an agglomeration of less than 2000. In 1846, 24.4 per cent of the population was urban, and 75.6 per cent rural, in 1851, 25.5 and 74.5, in 1861, 28.9 and 71.1, in 1872, 31.1 and 68.9, in 1881, 34.8 and 65.2, in 1891, 37.4 and 62.6, in 1896, 39.1 and 60.9, in 1901, 40.9 and 59.4, in 1906, 42.2 and 57.8.

The following table, which includes the communes having a total resident population of over 50,000 in 1911, shows the populations in that year, as compared with 1851 and 1901.

COMMUNES	1851	1901	1911
Paris	1,053,262	2,714,068	2,888,110

Béziers	19,333	52,310	51,042

The French birth rate is the lowest reported for any country. Following are comparative figures, relating to the year 1911, for marriages, for living births, and for deaths (exclusive of stillbirths) per thousand inhabitants: France, marriage rate 7.8, birth rate 18.7, death rate 19.6; Ireland, 5.4, 23.2, and 16.5; Sweden, 5.9, 23.8, and 13.8; Belgium, 7.9, 23.7, and 15.2; England and Wales, 7.6, 24.4, and 14.6; Netherlands, 7.2, 27.8, and 14.5; Germany, 7.8, 28.6, and 17.3; Austria, 7.6, 31.4, and 21.9; Italy, 7.5, 31.5, and 21.4; Spain, 7.2, 31.8, and 23.7; Hungary, 9.2, 35.0, and 25.1; Bulgaria, 9.6, 40.6, and 21.8; Rumania, 10.5, 43.0, and 25.7; Russia (in 1906), 9.6, 46.8, and 29.8. In France

the marriage rate, the rate of living births, and the death rate (exclusive of stillbirths) have varied as follows:

Year	Mar	Birth	Death	Year	Mar	Birth	Death
1816	8.5	32.9	24.5	1904	7.6	20.9	19.4
1831	7.6	30.3	24.6	1905	7.7	20.6	19.6
1841	8.3	28.5	23.2	1906	7.8	20.5	19.9
1861	8.0	27.1	22.3	1907	8.0	19.7	20.2
1861	8.2	26.9	23.2	1908	8.0	20.1	18.9
1872	9.8	26.7	22.0	1909	7.8	19.5	19.1
1881	7.5	24.9	22.0	1910	7.8	19.6	17.8
1891	7.5	22.6	22.9	1911	7.8	18.7	19.6
1901	7.8	22.0	20.1	1912	7.9	19.0	17.5

In 1911 and 1912 there were, respectively, marriages, 307,788 and 311,929, divorces, 13,058 and 14,579, living births, 742,114 and 750,651, stillbirths, 33,840 and 34,312, deaths of infants under one year of age, 116,659, total deaths (excluding stillbirths), 743,143 and 692,740. The small annual increase of the French population, as compared with the increase in other countries, gives rise to serious apprehension on the part of many French statesmen and furnishes a constant topic of discussion to economists and publicists among all nations. This apprehension appears to be unfounded. In most of the civilized world population is increasing at a more rapid rate than the production of commodities. Prices are higher, the struggle for subsistence is more severe, than at the beginning of this century. A decrease in the birth rate, which has already begun, as shown by statistics of many countries, is inevitable, and it is not unlikely that such a decrease, being compulsory, will for a time, by reason of want and keener competition, be attended by an increased adult death rate. The readjustment to economic necessity will be most painful in those countries whose total inhabitants are the largest in proportion to the primary producers. If the trend to the city, which is far greater in some other countries, does not become too accentuated, there is little to fear for continued economic prosperity and social well-being in "the pleasant land of France."

The population present, as distinguished from the legal population, was 38,844,653 in 1906, of whom 19,099,721 were male and 19,744,932 female. Of the males, 9,945,031 were unmarried, and of the females, 9,119,222, married, 8,151,990 and 8,188,834, widowed and divorced, 1,002,700 and 2,436,876. Of the total, 18,449,102 males and 19,126,484 females were French, 96,555 males and 125,607 were naturalized, and 554,064 males and 492,841 females were foreign. Of the foreigners, 214,052 males and 163,586 females were Italian, 159,097 males and 151,336 females Belgian and Luxembourgish, 45,281 and 35,633 Spanish, 35,836 and 52,000 German, 38,220 and 30,672 Swiss, 14,831 and 21,159 British, and 13,559 and 12,046 Russian. The annual immigration and emigration is small.

By occupation the active population was distributed as follows according to the census of 1906: agriculture and forestry, 8,777,053; manufacturing, 5,979,216; commerce, 2,002,681; domestic service, etc., 1,012,232; public service (including the army), 1,220,154; transport, etc., 887,337; mines and quarries, 281,027; fishery, 78,000; liberal professions, 483,179; total, 20,720,879, of whom 7,693,412 were female.

Ethnology The perspective of history re-

constructed by ethnologists is more continuous in France than in any other country. In blood the French combine many races—prehistoric Teutonic blond longheads, Alpine or Celtic shortheads, and Mediterranean brunette longheads. The stature of conscripts is given as 1.646 meters, and the general cranial index at 83.4, ranging from 75 to 88. But anthropometric characteristics have to be studied with caution, since the tall light-complexioned type, with blue or gray eyes, predominates in the north, the short-headed brunette type, marked by dark eyes and low stature, prevails in the middle and south, and the Mediterranean type, brunette, dark-eyed and short, occurs in parts adjoining Italy and Spain. The southern French may be called "Iberio-Celtic" and the northern French "Teuto-Celtic," the language of both being Italic. A retrospect of French ethnology includes (1) the modern period of racial coalescence since the Crusades, embracing also nationality and speech, (2) incursions of Saracens (arrested by Charles Martel, 732 A.D.), Burgundians, Franks (who gave their name to the country), and Visigoths, the last three being Teutons, (3) the Roman conquest and all that it means in racial mixtures, no less than in sovereignty and speech, (4) the earlier settlements of Belgian longheads, Celts, or Gauls, and Aquitanian and Ligurian brunettes, (5) Semitic and Pelasgian settlements, made by Phœnician and Greek colonists, of little account, however, to the ethnologist, (6) the peoples of the earliest Iron and the Bronze age, with a variety of skull types, (7) the Neolithic authors of menhirs and dolmens, exhibiting intermixture of brachycephals and dolichocephals, (8) the Cro-Magnon and the Neanderthal or "Spy man," Paleolithic contemporaries of the cave bear, mammoth, and reindeer, and, back of that, the rudest stone ages, when men are alleged to have lived with the mastodon and *Elephas antiquus*. France has experienced in this long stretch of time and evolution of culture the whole range of climates in which man can exist, ranging from arctic to tropical, together with their fauna and flora.

Education. Since the Franco-German War the subject of education has been one of intense interest to the French people. In this respect France has probably exhibited a greater zeal than any other European country. The Republic has considered it of first importance that it should fortify itself with an enlightened citizenship. Accordingly every grade of education has been subjected to a transformation that has been almost revolutionary. In the years 1881-82 were passed compulsory-attendance laws and laws abolishing tuition fees. Prior to that time the educational system had been more or less dominated by clerical influence, the Roman Catholic religion being taught, and a large number of the clergy having representation on the teaching staff. The influence of clericalism was detrimental to republican ideals and institutions. Consequently the educational reforms assumed a religious phase and have been more bitterly contested than in any other European country. In 1882 the teaching of religion in the schools gave way to the teaching of morals, and by a law of 1886 teaching in the public schools was limited to lay teachers, and schools in which religion was taught received no aid from the government. The dissatisfaction on the part of some with this secularization of the

schools was shown in the subsequent growth of the clerical *lycees* at the expense of the state schools of the same rank. The matter became of grave concern to the government. In its desire to lessen the attendance at the religious schools and thereby forestall the hostile influence which was presumably fostered by them, the government secured the adoption of the Associations Bill, which went into effect in 1902 and brought about the dissolution of many religious schools. By a second law which made three years' preliminary study in a state school a prerequisite to securing an official state position or to entering a special school, the government practically excluded graduates of clerical schools from admission to some of the leading professions.

The public system of education begins with the kindergarten or *écoles maternelles*, which admit children from the ages of two to six years. In addition to giving kindergarten instruction they served the function of infant schools where care may be given to children of the laboring classes. The establishment of these schools is optional with the communes. The number of pupils in 1901-02 and in 1911-12 respectively was as follows: at public lay schools, 411,369 and 514,735, at private lay schools, 7630 and 90,649, at clerical public schools, 53,746 and 1664, at clerical private schools, 281,063 and 13,513, total in lay schools, 418,999 and 605,384, total in clerical schools, 334,709 and 15,177, grand total, 753,708 (376,808 boys, 378,001 girls) and 620,561 (314,697 boys, 305,864 girls). Next after the *écoles maternelles* are the primary schools, attendance at which is compulsory for children between the ages of 6 and 13 (if not receiving instruction elsewhere), or until they have passed the examination for the completion of the course, which many of them do before the end of the compulsory time requirement. The instruction, as in the higher schools, is given to the sexes separately. The number of pupils at the primary schools in 1901-02 and in 1911-12 respectively was as follows: at public lay schools, 3,922,001 and 4,615,063, at private lay schools, 118,328 and 1,007,743, at clerical public schools, 285,033 (of whom, 266,967 girls) and 9264, at clerical private schools, 1,256,461 (of whom, 855,883 girls) and 50,282, total in lay schools, 4,040,329 and 5,622,806, total in clerical schools, 1,509,955 and 59,546, grand total, 5,550,284 and 5,682,352. The figures given here for both infant and primary schools include Algeria. The system has resulted in greatly reducing the illiteracy of the country, as is shown from the fact that, in 1880, 16 per cent of the newly married males and 25 per cent of the newly married females were illiterate, as compared with 2.1 and 3.2 per cent respectively in 1910.

The secondary schools include state classical colleges (*lycees*), supported by the state, and communal colleges, supported by the communes, though aided by the state, for boys, and schools of similar rank for girls. The following figures relate to public secondary education in 1903 and 1913 respectively: number of lycées and colleges for boys, 339 and 342, number of students, 94,205 and 100,203, lycées and colleges for girls, 71 and 138, students, 17,543 and 33,282. In private lay institutions for secondary education there were 19,935 students in 1903, and in private clerical institutions 44,623 students. The course of public secondary instruction covers

five years, the most usual age of students being 13 to 18. The establishment of the communal colleges is optional with the commune. The secondary schools award the bachelor's degree. The boys' lycées were formerly classical institutions, Latin and Greek occupying the principal place in the curriculum. In 1902 an elective system was introduced, making it possible to take either a modern language course or a science course, intended to prepare for a more practical career. Also four distinct courses are at the option of the student, but he cannot change from one course to another, or exercise any range of choice within the course selected. All courses lead to the same degree and confer the same privileges, and a degree may now be secured without the study of Greek and with only a minimum of Latin. History, civics, and ethics receive special emphasis, and the practical point of view is emphasized in the teaching of all subjects. The girls' lycées, however, from their introduction about 1881 took little notice of the ancient languages, but emphasized rather the French language and literature. The convents still have the patronage of a majority of those taking secondary courses, but the number who attend the newly established lycées is rapidly increasing. Many of the secondary schools are attended by both boarding and day students. A large number of the more intelligent students are assisted by a system of fellowships. Graduation from the secondary schools—public or private—is a prerequisite to securing the ordinary degree from the universities.

The interests of higher education are subserved by the 15 state universities and by various state faculties and schools and private special schools. From 1808 to 1896 the universities of France were deprived of their autonomy and were little more than degree-conferring groups of faculties. In 1896 their autonomy was re-established. The 15 universities are Paris, Lyons, Toulouse, Poitiers, Rennes, Nancy, Montpellier, Aix-Marseilles, Bordeaux, Dijon, Lille, Grenoble, Besançon, Caen, Clermont. In addition, there are state faculties or schools for higher or professional education at Amiens, Angers, Limoges, Nantes, Rouen, Tours, and Algiers. The faculties of the universities are paid by the state, but the universities are otherwise dependent upon the local community or upon private munificence. Numerous benefactors, by their liberal gifts, have shown an interest in the welfare of the universities. The response of local communities must naturally vary enormously, and there is therefore a great inequality in the size and prosperity of the different institutions. Those located in large and wealthy cities, like Paris or Lyons, have a great advantage over those in smaller towns. The enrollment in the University of Paris in 1913 was 17,104, about 44 per cent of the total attendance at the state universities. The French universities attract the most students of law, the number exceeding the total taking a corresponding course in German universities. The conditions upon which degrees were formerly conferred made it difficult for a foreign student to secure them, but with the new regulation introduced in 1897 degrees are more easily obtained, and there has consequently been a very large increase in the number of foreign students. The following figures relate to public superior education in 1903 and 1913 respectively: students under the law faculties, 10,930 and 16,763; medicine, 6735 and

3247, pharmacy, 2526 and 1312, medicine and pharmacy, 2433 and 1750, Protestant theology, 110—faculty suppressed pursuant to the Law of 1905, sciences, 4401 and 6639, letters, 4142 and 6398, total, 31,277 and 41,109, of the totals there were 2045 foreigners in 1903 and 5560 in 1913.

Besides the universities there is a large number of special schools, both government and private, covering almost every phase of science and art. The movement towards a more modern technical course of instruction has permeated the school system, having even entered the classical lycées, and in no other country do the provisions afforded for preparing for the practical affairs of life equal those of France. Special emphasis is given to instruction in commerce, agriculture, etc. Theological instruction is amply provided in private schools established for that purpose. Finally, the advancement of knowledge is sought through the organization known as the Institute of France (qv), whose five academies embrace in their scope every phase of learning.

The administration of the educational system in France is characterized by an unusual centralization and coordination. The highest educational officer is the Minister of Education, who holds a position in the cabinet. He is actively assisted by a superior council of 58 members, while a second council exercises advisory powers only. The whole state system is divided into superior, secondary, and primary departments, with a director responsible to the Minister at the head of each. For the administration of education France is divided into 17 districts called *académies*, and the civil departments serve as subdivisions for each of these. At the head of each *académie* is a rector, and at the head of each department an academy inspector, the latter receiving his appointment from the Minister. Subordinate to the academy inspectors are the primary inspectors—about 450 in number. The prefect of the department, assisted by a council, appoints teachers from an approved list submitted by the inspectors. The mayor and council of the communes are responsible for school property. The state pays all expenses for teachers, administration, and inspectors of the entire educational system, the departments pay for the erection and furnishing of normal schools, and the communes pay for the erection and furnishing of the local elementary schools. The total expenditure for public primary schools increases annually. In 1890 it was 177,142,000 francs (state 120,562,000, and communes 56,580,000); in 1900, 217,878,000 (146,908,000 and 70,970,000), in 1905, 268,787,000 (182,268,000 and 86,519,000), the state expenditure in 1910 was 216,974,000 francs, and, in 1911, 222,260,000 francs.

The educational system provides particularly for the preparation of teachers. Separate normal schools for the training of men and women teachers for the elementary grades are provided in each civil department, at which tuition, board, rooms, and books are free. Teaching is now a profession in France. Each normal student is pledged to teach 10 years, and all candidates for schools must hold normal certificates. Besides the elementary normal schools, there are a higher normal school, intended to qualify for inspectorships and other positions of high rank, and another normal school for kindergarten teachers. The supervision of the school

is in charge of the primary inspector (serving under the department inspector), who is judge of the teacher's proficiency, and upon whose recommendation depends the teacher's advancement or degradation. The schools have no position corresponding to that of superintendent or principal in the American schools. After serving the requisite time teachers are allowed to retire on a pension. The system is noteworthy in that it secures a high grade of teachers for country districts, inasmuch as the salary depends upon proficiency and is paid by the state, although the commune may supplement this from local funds, as is not infrequently done.

The French educational system seems to have failed to meet the educational needs of the country in one important respect. As compared with most of the American States, the number of pupils who continue their work into the secondary schools is small. Inasmuch as the children are young when they finish the primary course, there is a period in their lives when they are likely to be unoccupied and to lose benefits of the education already acquired. France has become aroused to the need of further educational provision for adolescents and adults, and the establishment of some form of night schools has been undertaken with remarkable success. Very little, however, has been contributed by the government for their support, their introduction and maintenance being largely in the hands of societies and organizations. These schools are sometimes in the nature of continuation schools, but they sometimes follow the style of university extension work or of the illustrated lecture.

Religion. Up to Dec 11, 1906, religion was subsidized by the state, the Roman Catholic, Protestant, and Jewish confessions receiving contributions from the budget in proportion to their numerical strength. The status of the Roman Catholic church, which embraces a very great majority of the population, was naturally an exceptional one. Its relations to the state were defined by the Concordat of 1801 as reenacted in the Organic Articles of the following year. By this agreement the church which had been deprived of its property in the Revolution surrendered its claims in return for a guarantee of state support. The main provisions of this celebrated instrument were as follows. The free and public exercise of the Roman Catholic Apostolic religion was guaranteed by the Republic. A new division of the French dioceses was to be made by the holy see in concert with the French government. Nominations to the new archbishoprics and bishoprics emanated from the government, while the Pope conferred canonical institutions upon the nominees. Before entering on their functions the bishops were required to take an oath of allegiance to the constitution and to promise "to carry on no correspondence, to be present at no conversation, to form no connection whether within the territories of the republic or without, which may in any degree disturb the public tranquillity." The holy see declared against any attempt to regain the alienated property of the church, but all church buildings which had not been alienated were placed at the disposal of the bishops. The government agreed to assign suitable stipends to the bishops and parish priests, and to enact legislation facilitating the bestowal of property for the support of religion by private persons. By the Law of Dec 9, 1905, the Concordat of 1801 and the Organic Articles of 1802 were

abolished, and state maintenance of Roman Catholic, Protestant, and Jewish clergy came to an end. No religion is now recognized by the state. This result was the culmination of the opposition of the great majority of Frenchmen to the political influence of the Roman Catholic church, more especially its control over education.

No religious census of France has been taken since 1872, and exact estimates of the numerical strength of the different religious faiths are misleading. It may be said, however, that about three-fourths of the people are, at least nominally, Roman Catholics. The indifference to the church manifested by a large number of members, and the radical opposition to the church and to all religions by nonmembers, and the resulting policy in regard to the church, have brought upon France the charge of being an agnostic nation. The source of the opposition is generally considered to be of an historical and political nature. The relation of the church with regard to the despised social order prevailing in pre-Revolution days is still charged against it. It is suspected of being out of harmony with republican ideals and institutions and of being intent upon grasping power to use against the present form of government. This charge is directed particularly against the religious associations. The intimate relations of these organizations with the Vatican presumably make their interests clash with those of the Republic. During the French Revolution religious orders were disbanded, and the enormous wealth they had accumulated was largely confiscated. But they afterward reestablished themselves and became three times as numerous as before the Revolution, there being, in 1901, 3216 establishments for men that were recognized by the government, comprising a membership of 30,136, while there were 2870 recognized and 13,428 unrecognized establishments for women, with a total membership of 129,492. A large part of these were engaged in educational work, which was naturally one of the most potent agencies for the spread of their influence. Their wealth had likewise accumulated, and they entered extensively into various kinds of commercial enterprise, which gave them another vantage ground for the exercise of their influence. Moreover, by virtue of their standing at Rome they were supposed to have practical control over the regular clergy and the main body of the church, whose sympathies and influence would otherwise presumably be more favorable to democracy. Opposition to the church and the fostering of agnostic propaganda is generally supposed to centre in the Freemason and the Socialistic elements of the population, and these factions on the one extreme and the ardent clericalists on the other are pitted against each other. In 1882 the opposition to clerical influence secured the abandonment of religious instruction in the public schools, and in 1886 the prohibition of clerical members from holding positions in them. These measures were followed in 1901 by very radical laws, directed particularly against the religious associations. According to these, all associations must be authorized by the government, and those found to violate the law or to be detrimental to the republican form of government or to good morals and order were to be dissolved. Parliamentary consent was necessary to the formation of associations which have foreign directors or a foreign domicile.

The law was especially directed against the association schools, and it was further provided that members of dissolved orders could not teach until their membership with the order was terminated. The law excited much opposition, and attempts to enforce it, especially in 1903, were so violently resisted that the government devised further measures, having in view the separation of the churches and the state. On March 28, 1904, a bill was passed for suppressing teaching by religious orders in conventual and monastic schools in France, except in institutions from which missionaries were recruited for the colonies.

The logical conclusion of these measures was the Separation Law of Dec 9, 1905, which has already been referred to. Under its provisions all religions may form voluntary associations for public worship, and the state, the departments, and the communes are relieved from the payment of stipends. To make the transition tolerable, a graded system of pensions was established for ecclesiastics of all religious denominations, according to age and term of service and proportional to the official salaries formerly received. All buildings used for public worship, and all dwellings in connection therewith, were ordered to be included in an inventory and made over to the voluntary associations for public worship, the churches and other places of worship in practical perpetuity—i.e., as long as the associations exist, the dwellings (prelates' residences, presbyteries, seminaries, etc.), for specified times and rentals. The position of the associations was improved by an amendment to the original bill in the Chamber of Deputies, which was agreed to by the Senate, exempting from taxation (except the mortmain tax) all buildings for public worship and belonging to the state, the departments, and the communes, and providing for their leasing at a nominal rental of a franc a year for 99 years. Furthermore, processions outside churches were authorized, although mayors of communes were allowed a discretion in forbidding them.

This law did not go into effect until Dec 11, 1906, but on December 8 of that year Pope Pius X issued an encyclical in which the French clergy were forbidden to act under the provisions of the Law of 1881 or of the Law of 1905. The arrest on Dec 11, 1906, of Monseigneur Montagnini, secretary of Cardinal Merry del Val, Papal Secretary of State, caused great excitement. He was stopped while entering France from Italy, and turned back from the frontier, on the charge of inciting French citizens to disobedience at the behest of a foreign power. The archives in the Nunciature at Paris were seized.

In proof of a desire to be as conciliatory as adherence to a firm policy would permit, the ministry of M. Clémenceau, which had been in power since Oct 23, 1906, introduced a bill supplementary to the Law of 1905. This measure, which was enacted and was signed by President Fallières on Jan 2, 1907, was intended to be, and is generally considered, a compromise in some respects, but was declared unacceptable by the Pope in an encyclical issued on Jan. 11, 1907. Subject to the provision that the Law of 1905 shall remain in full force in so far as it is not contradicted by the Supplementary Act of 1907, the latter declares that, independently of the associations contemplated by the Law of Dec 9, 1905, public worship can be held by

means of associations under the Law of July 1 1901, as well as in virtue of the Public Meetings Law of June 30, 1881, under individual initiative, that even in default of the cultural associations provided for by the Law of Dec 9, 1905, the use of edifices intended for worship, as well as the furniture contained therein, shall remain at the disposition of the faithful and of the clergy for the practice of their religion, and the free use of the churches may be accorded either to associations formed under the Law of 1901, or to clergy designated under the declarations prescribed by the Law of 1905, but this usage must be under the conditions of the Law of 1905, and the above-mentioned regulations apply to edifices intended for worship, which, having belonged to ecclesiastical establishments, have been assigned by decree to charitable institutions under the Law of 1905. The Supplementary Act of 1907 also declares that, with its promulgation, the state, the departments, and the communes will recover the free use of the episcopal mansions, presbyteries, seminaries, etc., which are their property, and the use of which has not been claimed by an association formed under the Law of 1905, and that lodging indemnities, falling upon communes where there is no presbytery, will cease, that the property of ecclesiastical establishments not claimed by associations constituted under the Law of 1905 will be assigned, upon the promulgation of this act, to charitable institutions, as provided by said law, without prejudice to assignments which may be made concerning property not dedicated to public worship, that, at the expiration of one month after the enactment of the present law, allowances made under the Law of 1905 to the clergy who have failed to carry out the requirements of that law will be suppressed, and that the failure of members of the clergy to fulfill the requirements of the law will in each case be determined by a joint decision of the Minister of Justice and the Minister of Finance.

The new law proved as unacceptable to the church as the Law of December, 1905. The vital objection was that neither law gave official recognition to the Roman Catholic hierarchy. In February the Roman Catholic bishops submitted a model contract for the leasing of churches between mayors of municipalities and parish priests. It vested the possession of the church for a period of 18 years in the parish priest, whose subjection to the Bishop was expressly recognized. On this basis negotiations proceeded.

The opposition to Roman Catholicism has not resulted in a strengthening of Protestantism, nor, though there are occasional defections on the part of the clergy, is there any general movement within the church to break with Rome. Protestantism is actually diminishing, and is thought to have lost considerably over one-third of its membership since 1835 (making allowance for the cession to Germany of Alsace-Lorraine), the number at present being probably about 600,000. At the same time the influence of Protestantism under the present government is doubtless out of all proportion to its numerical strength, as is evidenced by the large number of its representatives who are leading government officials. The Protestants are most numerous in the south of France, particularly in the Department of Gard. There are two branches of the Protestant church, the Calvinistic and the Lutheran, the former con-

taining the large majority of the Protestant population. The Jews are supposed to be decreasing and number less than 100,000, the large cities, Paris, Lyons, and Bordeaux, being the chief centres. See HUGUENOTS.

Charities. Thrift is a national characteristic of the French people, and pauperism has never been prominent in France. The policy adopted in dealing with the needy has been characterized by the emphasis which has been placed upon voluntary relief, and upon outdoor and local, as against institutional, relief. The state does not recognize that the individual has a legal right to demand alms and does not place the local communities under compulsion to provide means of charity relief. Direct parochial taxes for charitable purposes have not been levied since the time of the French Revolution. The scheme for charity administration as drawn up under Napoleon I made possible the formation of a *bureau de bienfaisance* in each commune, but it was not made compulsory and has been impracticable in the smaller and poorer communes. There is therefore no communal machinery of relief for the poor in a large part of rural France. These bureaux (consisting of the mayor of the commune and six commissioners) solicit and receive contributions from private sources, and the bulk of their endowment is secured in this way. Special grants are sometimes made by the communes, and a tax is levied upon theatres, balls, etc. The bureaux give outdoor relief, the amount of which is likely to be arbitrarily adjusted to the funds at command rather than to the existing needs. Many of the communes are provided with hospitals, and sometimes a number of communes jointly use the same hospital. Cooperation between the state systems of charity and private charity is minimized, inasmuch as private charity is mainly religious, while the attitude of the state is essentially antireligious.

There are, however, two classes of the needy that have been very adequately provided for, viz, the dangerously insane and children. The necessity for caring for the first of these is evident. Asylums for that class are established in the different departments (although there are also state asylums), and their support is divided between the departments and the communes. The state places itself under special obligation for providing for children by virtue of its law which prevents the attempt to fix the responsibility for fatherhood. Three different classes of children are distinguished in the system of child relief. The children of the first class are under two years old—*enfants du premier âge*—and are placed in the care of a nurse under surveillance of the government authorities, the expenses incurred being divided equally between the state and the department. The second group, or *enfants assistés*, includes foundlings, abandoned children, destitute orphans, and *enfants secourus*, not exceeding 12 years of age at the time when the government assumes control over them, although remaining under public control until they reach the age of 21. These children are usually placed in peasant homes until they are 13 or 14 years old, when they are made apprentices—preferably in the same family—under guardianship, the guardians being subject in turn to the oversight of the state-paid department inspectors. The other expenses incurred in providing for this group are shared between the state, the

department, and the commune. A large number of children requiring public attention but not coming under either of the above classes fall in a third group, *enfants moralement abandonnés*, who are generally apprenticed or placed in an industrial school.

A departmental system of medical aid was established in 1893, and, according to the statistical returns, by the end of the century about half of the population of France availed themselves of the medical aid thus supplied. The government further aids the masses through the establishment of savings banks, through the state monopoly of pawnshops, and, since 1897, by an annual contribution to old-age pensions. In 1905 an Act was passed for the relief of the aged poor, the infirm, and the permanently incurable, the expense to be borne by the communes, the departments, and the state. The cost to the state alone, as voted, in 1912 was 51,200,000 francs. A Law of 1910, amended in 1912, provides for all wage earners old-age pensions, towards which both employers and employees contribute, on Oct 1, 1912, 7,698,856 persons were registered. The administration of the charities system is in charge of a department under the Minister of the Interior. The influence of the central department operates largely through the prefects, who are responsible to the Minister, and who have a voice in the appointments of boards of managers of hospitals, asylums, and *bureaux de bienfaisance*.

Government. The present government of the French Republic is based on a series of three so-called "constitutional" laws, adopted by the National Assembly in 1875 and since that date amended and supplemented at different times by ordinary statutes, called "organic" laws. The French constitution, therefore, differs from most written constitutions in not being comprised in a single document. Another peculiarity is its brevity and conciseness. Only the barest outlines of the government are provided for in the fundamental law, all the details of organization being left to the determination of ordinary statute. The numerous limitations upon the power of the government in behalf of individual liberty, which constitute so notable a feature of the constitution of the United States, are wholly lacking in the French constitution. It is, in short, a constitution of government and not of liberty. That part of the constitution which is contained in the so-called organic laws is subject to amendment by the ordinary processes of legislation, while the provisions of the constitutional laws may be changed only by action of the Chambers united in National Assembly and by absolute majority of all the members.

The form of government which has prevailed in France since 1875 may be described briefly as a centralized parliamentary republic. The constitution provides for a bicameral Parliament, consisting of a Chamber of Deputies and a Senate, with substantial equality of powers in legislation, the only exception being the exclusive power which belongs to the Chamber of Deputies to originate revenue measures. As to the composition of the Chamber and the source from which it proceeds, the constitutional laws contain no provisions except the single one that its members shall be chosen by universal suffrage. It was provided by ordinary statute that universal suffrage should be considered as the suffrage of all male citizens at least 21 years of age, who have resided for a period of six

months previous to the election in the commune in which they offer to vote. Certain classes who have lost their civil and political rights, or who are in active military or naval service, or who have been judicially convicted of certain crimes, as well as those who have been declared bankrupt, are disqualified. It has also been determined by ordinary statute that the Chamber consist of deputies apportioned according to population, on the basis of one deputy to every 70,000 inhabitants. In 1914 there were 597 deputies, elected from the 87 administrative departments of France, as well as Algeria and the colonies. The departments are subdivided into *arrondissements*, containing approximately equal populations, and one deputy is elected from each. When an *arrondissement* contains a population exceeding 100,000, it is divided into two or more constituencies. The deputies are chosen, not according to general ticket (*scrutin de liste*), as presidential electors are chosen in the United States, but by district (*scrutin d'arrondissement*), according to the American method of choosing Representatives. Both methods have been tried, chiefly with a view to obtaining party advantage, but since 1889 the single-district method has been in use and seems likely to continue as a permanent institution. The constitutional laws make no provision concerning the qualifications of deputies. The completion of the twenty-fifth year, however, has been prescribed by statute as a necessary qualification. To this is added a number of disqualifications, such as the holding of certain other incompatible offices at the same time. The term of service is fixed at four years, unless the Chamber is dissolved earlier, and the members are privileged from arrest during the session, unless taken in the act of committing a crime. They are, moreover, exempt from legal responsibility for opinions expressed during the discharge of their legislative duties.

The constitutional laws now in force make no provision concerning the composition and organization of the Senate, and but scant provision in reference to its powers. A Statute of 1884, which superseded the constitutional law on the subject, provides that it shall consist of 300 members, chosen by electoral colleges in the various departments. In each department this body consists (1) of the deputies chosen in the particular department, (2) the members of the general council of the department, (3) the members of the councils of the several *arrondissements* in the department, and (4) delegates chosen by the municipal councils of all the communes of the department. The senators are apportioned among the several departments according to population, the number in each varying from 1 to 10. In contrast to the method of choosing deputies, the senators from a given department are selected on a general ticket (*scrutin de liste*), each elector voting for the whole list. By statute the qualifications of senators are fixed at citizenship and the completion of the fortieth year. There are also certain disqualifications similar to those in the case of deputies. The tenure of senators is fixed at nine years, and, to secure partial renewal, it is provided that the terms of one-third of them shall expire every three years. Originally there were 75 life senators, chosen by the National Assembly, their successors being selected by the Senate. By an amendment to the constitution, adopted in 1884, however, this remnant of mon-

archy was abolished, and it was provided that thereafter vacancies occurring among life senators should be filled according to the manner prescribed for the choice of nine-year senators. Senators have the same rights and privileges as deputies and receive the same salary, which at present is 9000 francs a year. In addition to its legislative duties, the Senate has two peculiar functions: first, its consent is necessary for a dissolution of the Chamber of Deputies—a restraint upon the possible arbitrary conduct of the President, and, second, it acts as a high court for the trial of persons accused of attempts upon the safety of the state.

The constitution requires the two chambers to assemble annually in January and to remain in session at least five months. The President may convoke them at an earlier date, and he is bound to do so if the demand is made by a majority of the members composing each chamber. They may also be adjourned by the President, but the duration of the adjournment cannot exceed one month and is not permitted to occur more than twice in a session. Bills may be presented in either chamber by private members or ministers, except that revenue measures must originate in the Chamber of Deputies. Whether the Senate has the right to amend bills of this character is a disputed question. The Chamber of Deputies denies the right of the Senate to increase its revenue proposals, but the Senate has asserted its right successfully on a number of occasions. All bills must be referred to a special committee for consideration before being taken up in either house. A measure duly passed by both chambers is sent to the President for his approval. He has neither an absolute nor a qualified veto, although he may demand reconsideration of the measure, and a constitutional obligation rests upon the chambers to consider his objections, but if they repass the measure by the regular majority it becomes law in spite of the President's objections.

Although the parliamentary system of government prevails in France and monarchical traditions are strong, the chief executive is elected, not, however, by popular vote, but by a body composed of the members of the two chambers of the Parliament. They are required to meet for this purpose at Versailles at least one month before the legal expiration of the presidential term, and in case of the death or resignation of the President they are commanded to assemble immediately and form themselves into an electoral college. A majority of the whole number of members is necessary to elect. The only qualification prescribed by the constitution is that the President shall not be a member of any family that has reigned in France. His term is fixed at seven years, and it is expressly declared that he is reeligible. The President's position is one of irresponsibility except for the offense of high treason, and even then he is subject to arraignment by the Chamber of Deputies only, and to trial by the Senate only.

The powers and duties of the President are manifold. In the domain of foreign relations his powers include the negotiation of treaties, with the limitation, however, that treaties of peace and of commerce, treaties which add to the financial burdens of the state or which subtract from its territory, or which affect the personal or property relations of Frenchmen in foreign countries, must be approved by the

chambers, the appointment and reception of ambassadors and ministers, and perhaps the power to wage defensive war and, with the assent of the chambers, to wage offensive war. Besides the powers of the President in legislation, to which reference has already been made, he may prorogue the Parliament, may initiate legislative measures, and it is his duty to promulgate the laws. In the field of administration he has a wide power of appointment and of supervision and an extensive ordinance power. The constitution expressly confers upon him the appointment of all officers and by implication the dismissal of most of them. He has the power of issuing the necessary ordinances for the execution of the laws where the Parliament has not made provision for the same. He has also the power in many cases to issue supplementary ordinances for the purpose of filling out the details of legislative acts, for it must be remembered that it is the practice in France to embody only the main facts in the statutes, leaving minor details to be supplied by executive ordinance. The military powers of the President include the disposition of the army and navy, while in the domain of judicial administration he is vested with the power to grant pardons, commute penalties, and issue reprieves.

In exercising the above-mentioned powers the President acts through ministers, who are collectively responsible to the chambers for the general policy of the administration and individually responsible for their own personal acts. The constitution expressly declares that every official act of the President to be valid must be countersigned by a minister, thus insuring the irresponsibility of the President. Theoretically, at least, he is in the position of the British sovereign and can do no wrong. In theory the ministers are appointed by the President and serve during his pleasure. In practice they are appointed by the leader of the majority in the Chamber of Deputies, and they resign when defeated. Legally their responsibility is to both chambers, but, as a matter of fact, it is only to the Chamber of Deputies, and an adverse vote in the Senate no longer leads to the resignation of the ministry. Usually the ministers are selected from the members of the Parliament, but whether they are or not, they are entitled to seats in the chambers and must be heard whenever they wish to speak. Their duties are of a twofold character. In the first place, they are the heads of the several administrative departments of the government, and secondly they are the leaders of the parliamentary majority in the Parliament, and the representatives of the government whose measures they seek to have adopted, and whose general policy they defend against attack. The number of ministries or departments is fixed by decree of the President, and varies from time to time. In 1914 there were 12: those of the Interior, of Justice; of Foreign Affairs, of War, of Marine, of Public Instruction and Fine Arts, of Public Works, of the Colonies, of Commerce, Industry, Ports, and Telegraphs, of Agriculture, of Finance; and of Labor. Besides acting as heads of the departments, they are also members of the Council of State, the highest administrative court in the Republic. Their responsibility is both political and criminal. Their political responsibility is collective in matters of general policy and single in cases of individual activity

and is secured by liability to dismissal from office. Their responsibility for crimes committed in the exercise of their duties is to the Parliament, the Chamber of Deputies acting as the accuser and the Senate as the trial court. For crimes committed in their private capacity they are responsible to the ordinary judicial courts. The ministers are held to their political responsibility through several forms of interrogation in the chambers. These are the "direct question," which any member may ask of a minister after previously securing his consent, the purpose being to gain information concerning the policy of the government, and the "interpellation," which is a formal challenge of the government's policy and is usually followed by a vote of confidence or of disapproval. Unlike the direct question, the interpellation is always in order, and the consent of the minister questioned or of the cabinet is not necessary.

Finally, it should be said that French ministries are short-lived, chiefly on account of the numerous party divisions and factional groups in France. As yet no ministry of the Republic has continued in power for a period exceeding three years.

The judicial system of France is a purely statutory creation, the only constitutional provision on the subject being that which relates to the constitution of the Senate as an extraordinary court for certain cases. By statute a hierarchical system of judicial and administrative courts has been created. Of the judicial courts, the highest is the Court of Cassation at Paris, which is composed of a first president, three presidents of sections, and forty-five judges or counselors. Next below this tribunal are the 26 Courts of Appeal, each composed of a president and four counselors and with territorial jurisdiction over several departments. They hear cases from the Courts of First Instance in the arrondissements, while these in turn hear appeals from decisions of the justices of the peace in the cantons (subdivisions of the arrondissements). These latter try civil cases and act as police judges for the disposal of petty offenses. For the trial of criminal cases involving penalties up to imprisonment for five years, police correctional courts without juries are provided. More serious crimes are tried by courts of assizes, constituted periodically in each department, and including a jury of 12 men who are the sole judges of the question of guilt, and who fix the punishment. The ordinary civil courts are without juries, the judges alone deciding questions of fact as well as of law. The judges are appointed by the President of the Republic, and their tenure, except in the case of the justices of the peace, is during good behavior. They can be removed only by the Court of Cassation.

The administrative courts are an outgrowth of the Napoleonic legislation and are intended to relieve the judicial courts from the decision of administrative questions. It is the French theory that such questions should be determined by men who have a practical knowledge of administrative law rather than by judges who have been trained only in the private law. The administrative courts are tribunals of enumerated jurisdiction, but the general rule is that they take cognizance of all administrative acts. The judges of the administrative courts are all appointed by the President, but, unlike the members of the judicial courts, are removable at

his pleasure. They are trained in the work of administration and receive large salaries. The most important administrative court in France, as well as the highest, is the Council of State. It is composed of 116 members (councilors, commissioners, and auditors), and is divided into four administrative sections and one judicial section. It has both original and appellate jurisdiction in a variety of administrative matters. Next to the Council of State in importance are the prefectural councils of the departments. There is one in each department, and it is composed of several councilors, together with the prefect. It has a large contentious jurisdiction in administrative matters, and appeals from its decisions lie to the Council of State. Besides these courts, there are a number of special administrative tribunals of minor importance. To determine whether the administrative or the judicial courts shall have jurisdiction in a given case, where the question of the forum is in dispute, a Tribunal of Conflicts is provided. It belongs to the prefect to raise the question of competence, whereupon the matter is sent to the Conflict Court for determination.

Local government in France differs from the English and American systems in several important respects. In the first place, the organs of local government in France are not generally authorities of enumerated powers, but are vested with the management and control of all local affairs without any attempt at specification. Secondly, to prevent the local organs from misusing such wide powers, the method of central administrative control has been introduced. This is the most important characteristic of French local government and, like the system of administrative courts, was inherited from the Napoleonic era. While it secures uniformity and symmetry, it destroys the element of local self-government. The activities of the local organs are twofold. In the first place, they are made use of by the central government for the administration of matters of central concern. In the second place, they attend to matters of purely local interest largely according to their own ideas and through officers of their own choosing. For the purposes of administration France is divided into 87 departments, in each of which is a prefect, appointed and removed at the pleasure of the President. He is both a central and a local officer. As agent of the central government, he supervises the execution of the national laws, and decrees and instructions of the ministers, particularly those of the Minister of the Interior, of whom he is a subordinate, issues police ordinances, appoints many officials and directs them in their duties, and makes reports to the government on matters in which it is concerned. In this capacity he is assisted by a prefectural council, appointed and dismissed by the President—a body whose advice he is often bound to ask, but never obliged to follow. As a local officer, he appoints all the officials in the service of the department, has charge of departmental finances and public improvements, and executes the resolutions of the general council. This latter body is the legislative assembly of the department and is chosen by universal suffrage for a term of six years, one-half the members retiring every third year. It holds regular sessions twice a year, and the subjects to which its legislative power extends include departmental property, finances,

highways, public works, and poor relief. Its resolutions in many cases may be annulled by the central government, and in some cases they must be approved by the President of the Republic to be valid. If, e.g., in the preparation of the budget, the council should neglect or refuse to make the necessary appropriations or levy the taxes required, the President is empowered to order it done.

The next local subdivision below the department is the *arrondissement*. This is an administrative and election district rather than a public corporation for purposes of local government. Below the *arrondissement* is the *canton*—an election and judicial district of little importance. The lowest administrative unit is the *commune*—a local area of historical growth rather than an artificial creation. It may be either urban or rural and varies in size from a few acres to several square miles. The two communal organs which correspond to the prefect and the general council of the department are the mayor and the municipal council. The mayor, like the prefect, is both a central and a local officer, and since 1884 has been elected by the municipal council. As a central officer, he is subject to the control and direction of the prefect. He serves during the term of the council by which he is elected, but may be suspended temporarily by the prefect or Minister of the Interior, and removed by the President. As central officer, he keeps a register of vital statistics, solemnizes marriages, has charge of the police, and issues ordinances affecting the public health, order, and safety. As local officer, he appoints most of the communal officers, administers the local property, draws up the budget, and supervises the execution of the resolutions of the municipal council. The municipal council is the deliberative organ of the commune and is elected by universal suffrage for a term of four years. It holds four regular sessions annually, may be suspended temporarily by the prefect, and dissolved by the President of the Republic. Its duties extend chiefly to purely local affairs, but the approval of the central administration is necessary for the validity of its resolutions on many subjects, such as those relating to the erection of public works, incurring loans, levying taxes, and appropriating money. Any act deemed by the central administration to be in excess of its jurisdiction may be declared void. Excepted from this general system of municipal government are the capital, Paris, and the city of Lyons, for the government of which a special arrangement is provided.

NATIONAL DEFENSE

Army. In order to avoid erroneous conclusions in making comparisons and to comprehend the organization of the French army, it is advisable to consider the basic units on which that organization depends.

Infantry.—The real basis of the French infantry organization is the battalion. Usually a battalion has 4 companies, sometimes 3, sometimes 5 or 6, or even more. The number of battalions in a regiment varies greatly. The maximum is 4 battalions to the regiment. As a rule, the infantry company has 3 officers and 140 men in peace, in war, about 250 men. From these data it will be noted that the unit of organization, the battalion with a variable

number of companies, is quite different from the basic unit of the United States army, which is always the regiment of 3 battalions of 4 companies. The French battalion at war strength has, on the average, 19 officers and 1009 men, the United States army battalion, 13 officers and 566 men.

Cavalry—The basic unit is the squadron, which is composed of 5 officers and 150 men. A squadron of French cavalry corresponds more nearly to the United States army troop of 3 officers and 86 men than to the United States war squadron of 4 troops consisting of 14 officers and 363 enlisted men. See CAVALRY.

Field Artillery—The unit usually taken is the battery, which at peace strength varies from 3 officers and 110 men to 3 officers and 175 men; at war strength, 4 officers, possibly 5 and 175 men, which is almost identical with the United States war battery of 5 officers and 171 men. The French mountain battery has about 140 men. Light batteries have 4 guns, mountain batteries, 6.

Foot Artillery—All officers of artillery including field artillery, are on one list. Foot artillery is divided into two branches, coast artillery and fortress artillery. The latter garrisons the land fortifications. It is believed that in certain cases a part of the fortress artillery may be used with the mobile forces. The total peace strength of foot artillery, including workmen, is about 468 officers and 16,162 men.

Technical Troops—There is no division, as in the United States, between signal troops and engineers. All technical troops are known as engineers, including the Aeronautical Corps. They aggregate 585 officers and about 18,000 men. The war strength of the major portion of the engineer companies is 4 officers and 252 enlisted men each. See ENGINEER, CORPS OF.

The Aeronautical Corps is organized in three groups. Each group has from 2 to 4 companies. Sections are detached with the mobile army. In the spring of 1914 there were 27 sections of 8 aeroplanes each, 10 cavalry sections of 3 aeroplanes each, and 11 fortress sections of 8 aeroplanes each, aggregating a total of 334 aeroplanes. There were also 14 dirigibles.

Tram Troops are organized into "squadrons", each squadron contains 3 companies. Total peace footing, 412 officers and about 10,500 men.

Sanitary Troops—About 1500 officers and 6200 men.

Veterinarians—About 475 officers.

The French army proper is known as the Metropolitan Army and is stationed in France, Algiers, and Tunis. The Colonial Army is stationed in France and the French colonies and is distinct from the Metropolitan Army, though both are administered by the War Minister. The Colonial Army is made up of both white and native troops.

Service in the Metropolitan Army is universal and compulsory, there being no exemptions except for physical disability. The period of liability is from the age of 20 to 48, as follows, under the provisions of the Law of 1913: with the colors, 3 years, joining at the age of 20; with the reserve, 11 years, with the territorial army, 7 years, with the territorial reserve, 7 years. This makes a total liability to service of 28 years, ending at the age of 48. Service in the Colonial Army is normally by voluntary enlist-

ment for 3, 4, or 5 years or by voluntary transfer from the Metropolitan Army for the same periods. For the West African native troops, however, enlistment may be compulsory. The reserve for the active army is called out twice for a period of 4 weeks, the territorial army once for 2 weeks, the territorial reserve has no regular training.

Higher Organization—The French Army Corps is recruited from a definite territorial district. There are 20 army corps organized in peace and 1 additional Colonial Army Corps in Algeria, making 21 in all. Army corps usually have 2 divisions, sometimes 3. There are 2 brigades to a division, 2 infantry regiments to a brigade, which contains from 6 to 8 battalions. To each infantry division is attached 1 field artillery regiment of 9 batteries (36 guns). The corps artillery consists of 9 field and 3 howitzer batteries, plus 6 skeleton batteries, which in war give a total of 144 guns per corps. To the corps are also attached a cavalry brigade of 2 regiments and certain technical troops. The heavy batteries of 2 guns each are distributed as needed by army corps. There are 10 cavalry divisions, each made up of 3 brigades of 2 regiments each, to which 2 or 3 batteries of horse artillery are attached. Aggregate for a cavalry division, 24 squadrons and 12 guns. Based on the above, the army corps presents a combatant strength of about 33,000, the cavalry division about 4700.

The reserve of the active army and that of the territorial army are each organized into 36 divisions and in addition furnish garrisons for the home stations, the surplus men being called to the regimental depots to supply the losses in battle. There would also be available for garrison duty 38 battalions of the Customs Corps and a large number of *chasseurs forestiers*, both of which classes are recruited from the army. The *gendarmerie* (military police), amounting to more than 20,000 men, would be available for local distribution. The police force of Paris, called *Garde Républicaine*, about 3000 strong, would be used for similar duties.

The Colonial Army, amounting to a total of about 87,000 men (47,000 Europeans and 40,000 natives), should be distinguished from the Metropolitan Army. The service in the former is normally voluntary, in the latter compulsory and universal. Of the Colonial Army 28,000 Europeans are permanently stationed in France, 19,000 Europeans and 40,000 natives in the French colonies, giving a total of 87,000 men in time of peace. The officers and noncommissioned officers of native regiments are French. The colonial troops stationed in the colonies include the famous Foreign Legion (2 regiments, each of 4 battalions, headquarters Algeria) in Indo-China; 13 battalions and 4 companies of colonial infantry, 32 batteries of artillery, a squadron of native cavalry, several companies of native sappers, and 49 battalions of native infantry. The Metropolitan Army (total peace strength, 639 battalions of infantry, 445 squadrons of cavalry, 694 batteries of artillery) includes 30,000 natives stationed in Algeria and Tunis. These, with the 620,000 Europeans in France and 53,000 Europeans in Algeria and Tunis, give a total of 703,000 for the Metropolitan Army. The horses maintained for this army number 150,634. Adding the total Colonial Army of 87,000, we have an aggregate of 790,000 for the total peace strength. These figures for

1914 do not include administrative corps, staffs and services, military schools, etc

Due to the Law of 1913, increasing the length of service with the colors to 3 years, and to the increased reserve service, the field army of France may be roughly estimated at 800,000 combatants. The 36 reserve divisions and reserve cavalry add 500,000 more. The Algerian Corps and Colonials in France would add about 80,000 men, giving a grand total of 1,380,000 combatants, available for war.

Administration is by a general staff and several departments under the War Minister, assisted by the Conseil Supérieur de la Guerre, consisting of 12 general officers, among whom are the chief of the general staff, commander in chief in case of war, and the chief of the army staff.

The Budget for 1914 provides for an expenditure

For the Metropolitan Army	\$209,472,660
Colonial Troops in France	9,866,280
Troops in Morocco	46,779,360
Armament and supplies	21,180,000

Total * \$287,298,300

* Expense of colonial troops abroad not included in this total

The fighting strength of the French army on the initial mobilization was estimated at 650,000 rifles, 60,000 sabres, and 3000 field guns, that of Germany at 1,000,000 rifles, 80,000 sabres, and 5500 field guns.

Arms—The French infantry use the Lebel magazine rifle, calibre, 0.315 inch. The cavalry has the carbine. The field gun is a rapid-fire shielded gun, 2.95-inch calibre, and is considered the best in Europe. The howitzer batteries use calibres of 4 inches and 6.2 inches.

The fortifications of France may be divided into two general classes—seacoast defenses and land defenses, the former to protect a coast line of 1760 miles, the latter a line of 1575 miles. The land defenses are usually grouped into three classes, according to their relative strategic importance and corresponding strength of garrison. In recent years the tendency has been to place more reliance on the strategic and tactical operations of the mobile army, with the result that many of the second and third class fortified places have been put out of commission. On the principal land frontier of Germany the fortified places are Verdun, Toul, Epinal, Belfort, behind which is a second line as follows: Maubeuge, La Fère, Rheims, Langres, Dijon, Besançon. Along the Italian front are Briangon, Grenoble, and Lyon. On the coast line the principal naval stations, guarded by the forts, are Toulon, Rochefort, Lorient, Brest, and Cherbourg.

Total War Strength—The mobilization strength of 1,380,000 combatants above estimated could be increased, as war progressed, to possibly 3,000,000, all trained men. Upon the complete realization of the intent of the provisions of the Law of 1913, the number will probably reach 3,500,000.*

* In estimating the total strength of armies from figures furnished by different authorities, care should be taken to note what organizations are included and what are omitted, what are without staffs, and what staffs are without organizations, the size of the basic units in war and in peace, whether officers, official administrative services, colonials and native troops are considered, the character and numbers of the several reserve quotas of trained and partially trained men, and to what extent the latter are available for war service.

Navy The French navy, which in 1914 was considered to rank fourth among the powers of the world, is an important element in the national defense and one that is being constantly improved and strengthened. It is under the direction of the Minister of Marine, assisted in regard to matters of administration by an Undersecretary of State. The Minister presides over an admiralty council, with executive powers similar to those of the British Board of Admiralty. The naval members of this council, which was established in 1913, are the chief of the general staff, the naval director of *personnel*, the director of *matériel*, and the chief of the naval cabinet. By a Law passed Feb 13, 1912, the establishment of the French navy was set at 28 battleships, formed into 4 squadrons of 6 ships each, with the remaining 4 in reserve. To each squadron were to be attached 2 scout cruisers and 12 destroyers, with 2 cruisers and 4 destroyers to be held in reserve. The foreign-service fleet was to consist of 10 ships additional, with such smaller vessels as might be needed, and the submarine flotilla was to consist of 94 vessels, with 4 mine laying ships and such mine-raising vessels as might be required. This establishment was to be attained by 1919, and accordingly it was necessary to build battleships at the rate of 2 a year from 1910 to 1917. The extent to which this had been attained by 1914 may be seen from the following résumé of effective fighting ships built and building at the beginning of that year. Of modern battleships, i.e., dreadnoughts, there were 8 built, 10 building, making a total of 18, having 394,249 tons' displacement; of older battleships of the pre-dreadnought type, there were 13 built, with a displacement of 163,508 tons, of first-class cruisers, there were 18, with a tonnage of 191,761, and light cruisers 12, with a tonnage of 60,086, of destroyers, there were 83 built and 4 building, of torpedo boats less than 20 years old, there were 153, and of submarines 70 built, with 23 building. The French navy is manned partly by voluntary enlistment and partly by conscription. The "Inscription Maritime," on which are enrolled the names of the male seafaring population from 18 to 50 years of age, was introduced by Colbert, the Minister of Marine under Louis XIV. This list, which contains the names of about 114,000 men, supplies 25,600 conscripts, who ordinarily serve with the fleet, and would supply 50,000 more needed in case of mobilization. In 1913 the *personnel* amounted to 63,859, distributed as follows: 15 vice admirals, 30 rear admirals, 360 captains and commanders, 1457 other line officers, 60 midshipmen at sea, 505 engineer officers, 394 medical officers and pharmacists, 219 pay officers, 175 naval constructors, 139 warrant officers and adjutants principaux, 60,505 enlisted men, making a total of 63,859.

The French coasts are divided into 5 marine arrondissements, with headquarters at Cherbourg, Brest, Lorient, Rochefort, and Toulon, at all of which stations shipbuilding establishments are maintained. Each arrondissement is in charge of a vice admiral, who is responsible not only for administration, but for the mobile and fixed defense of the district. In 1912 and later considerable change was made in the organization and disposal of the French fleet. The French squadrons in the Far East and the Pacific were suppressed, and the Atlantic division disappeared, the plan being to concentrate the fleet

and especially the more powerful battleships in home waters. At the conclusion of the *entente cordiale* and at the opening of the war in the Balkan Peninsula, the battleships were withdrawn to the Mediterranean, and, as a result, the fleet in these waters at the beginning of 1914 was made up as follows: first squadron of battleships, *Courbet*, *Jean Bart*, *Condorcet*, *Danton*, *Diderot*, *Mirabeau*, *Vergnaud*, and *Voltaire*, second squadron, made up of older battleships, *Patrie*, *Démocratie*, *Justice*, *République*, and *Vérité*, reserve ships, *Bouvet*, *Gaulois*, and *St Louis*, and the armored cruisers *Waldeck Rousseau*, *Edgar Quinet*, *Ernest Renan*, *Jules Ferry*, *Léon Gambetta*, and *Victor Hugo*. In the Eastern waters the armored cruisers *Montcalm* and *Dupleix* were maintained, and the remaining naval service was performed for the most part by smaller ships.

The chief torpedo stations are Dunkirk, Cherbourg, Brest, Lorient, Rochefort, Toulon, Corsica, Bizerta, Oran, Algiers, and Bona. At these points torpedo and submarine flotillas, dirigibles and sea planes are maintained, and at Brest is the principal naval school. In 1912 a French Navy Aviation Service was established with dirigibles, aeroplanes, hydroaeroplanes, and the necessary hangars, aerodromes, and station ships for their maintenance. At Cherbourg, Brest, Lorient, Rochefort, and Toulon there are large government dry docks, and at St Nazaire and Havre large private docks, belonging to steamship companies or shipbuilding establishments. The 1914 naval estimate as voted was £19,818,052, an increase of £1,131,007 over 1913, exclusive of extraordinary charges for the naval programme. In 1914 the total amount spent on new construction was £10,720,000, of which £4,600,000 was for work in the government dockyards and £6,120,000 in private dockyards. Both in private and government dockyards the rate of construction of French battleships has been materially improved.

In 1914 there were under construction in France a number of dreadnoughts which had been laid down in 1913. These were the *Flandres*, *Gascogne*, *Languedoc*, *Normandie*, and the *Béarn*, the last named having been contracted for in 1914. These battleships were to have a length over all of 623 feet, or water-line length of 574½ feet, and a displacement of 24,800 tons, mounting twelve 13.4-inch guns of 35 calibres, in three quadruple turrets on centre lines, besides 24 guns of 5.5 inches of 50 calibres in a secondary battery. There were also under construction three battleships, launched in 1913—the *Lorraine*, *Bretagne*, and *Provence*—each with a length of 546 feet on the water line and a displacement of 23,177 tons, having an armament of 10 13.4-inch guns of 45 calibres, mounted in pairs on turrets, with a secondary battery of 22 5.5-inch guns. In 1914 there were projected, and provision was made even before the war with Germany, for four additional dreadnoughts—the *Duquesne*, *Tourville*, *Lyon*, and *Lille*, mounting 16 13.5-inch guns. These battleships were to have a length of 623 feet and a displacement of 29,500 tons. A secondary battery was to comprise 28 5.5-inch guns.

In 1914 France had under construction 6 destroyers and 23 submarines. Of the latter not less than 6 were of 820 tons' displacement and 400 horse power each. During this year there were completed the dreadnoughts *Paris* and *France*, and in 1913 of the same type the *Jean*

Bart and the *Courbet*, having a water-line length of 541.3 feet and a displacement of 23,096 tons, with an armament of 12 12-inch, 50-calibre guns, arranged in pairs in turrets, with a secondary battery of 22 5.5-inch, 50-calibre guns. See NAVIES.

HISTORY

Gallia, or Gaul, was the ancient name under which France was designated by the Romans. They knew little of the country till the time of Cæsar, who, after a series of wars covering nearly eight years, completed its conquest in 50 B.C. At this time it was occupied by three branches of the Celtic race—the Aquitani, the Celts, and the Belgæ. There were also some Germanic inhabitants and a few Ligurians and Greeks, but the latter never penetrated far beyond the shores of the Mediterranean, where they planted colonies, the most important of which was Massilia (Marseilles). Under the Roman rule Gaul advanced rapidly in civilization and refinement and was one of the most important portions of the Empire. (See GAUL.) With the decline of the Roman power in the fifth century it fell completely under the power of the Visigoths, Burgundians, and Franks. In 486 A.D. Clovis, a chief of the Salian Franks, by his victory over Syagrius near Soissons, put an end to the Roman dominion. Clovis embraced Christianity in 496. After his death in 511 his kingdom was divided among his sons, Theodoric, Chlodomer, Childebert, and Clothaire. His dynasty, known as the Merovingian, ended in the person of Childebert III, who was deposed in 751, after the reality of kingly power had already passed into the hands of the Mayor of the Palace, Pepin, called Pepin of Herstal, and after him into those of Charles Martel and Pepin the Short, the latter of whom ascended the throne as the first of the Carolingian rulers. (See FRANKS, MEROVINGIANS, CAROLINGIANS.) The accession of Pepin gave new vigor to the Frankish monarchy, which, under his son and successor, Charles the Great, crowned Emperor of the West by Pope Leo III in 800, became a powerful empire. Christianity, civilization, and letters were protected during the reign of Charles the Great, and before his death he had extended the limits of his Empire almost from the Baltic to the Mediterranean, and from the Bay of Biscay to the coast of Illyria. After his reign, however, this vast power crumbled to pieces. By the Treaty of Verdun, in 843, three years after the death of Louis the Pious, the son of Charles the Great, the Frankish Empire was divided among his sons. The lands east of the Rhine, whose inhabitants were predominantly Teutonic in race and language, were assigned to Louis the German, the part corresponding closely to modern France and the southern part of Belgium (the kingdom of the western Franks) fell to the possession of Charles the Bald, between the two lay the territories of Lothair, who, in addition, received Italy and the Imperial title. The descendants of Charles the Bald (died 877) possessed little or none of the vigor of the early Carolingians. Louis the Stammerer (877-879) was the helpless creature of powerful nobles. Louis III and Karlmann, sons of Louis the Stammerer, were forced to witness the loss of the Rhône valley and the hostile incursions of the Northmen. In 884 Charles the Fat, King of Germany and of Italy, was made King of the western Franks,

thus reuniting the realm of Charles the Great. After a stormy reign of three years, in the course of which Paris all but fell into the hands of the Northmen, he was deposed, and Odo, Count of Paris, was raised to the throne of France. Intestine wars desolated the land, and foreign assailants threatened it on every side. Under Charles the Simple (893-929) the ravages of the Northmen had assumed so persistent a character that the King was glad to purchase immunity from their encroachments by the cession of the territory subsequently known as Normandy (911). In the kingdom anarchy reigned paramount, the various governors established an hereditary authority in their several governments, and the crown was by degrees deprived of the best part of its possessions. The power of some of the vassals surpassed that of the kings, and on the death of Louis V the Carolingian dynasty was replaced by that of Hugh, Count of Paris, whose son, Hugh Capet, was elected King by the army and consecrated at Rheims in 987. See CAPETIAN DYNASTY.

At this period the greater part of France was held by almost independent lords, and the authority of the Capetian kings for more than a century extended little beyond Paris and Orléans. Among the most important of the great feudal vassals whose possessions made up the lands of the French crown were the counts of Flanders, Vermandois, and Champagne, the dukes of Normandy, Burgundy, and Aquitaine, and the counts of Anjou, Blois, and Toulouse. Louis the Fat (1108-37) was the first of the Capetians who ruled with a strong hand. He exalted the power of the crown at the expense of the feudal nobles and increased the royal territory. Louis VII (1137-80), who took part in the Second Crusade, was frequently engaged in war with Henry II of England, whose marriage with Eleanor of Aquitaine made him master of that region and Poitou, in addition to his hereditary possessions of Normandy and Anjou. Louis's son and successor, Philip Augustus (1180-1223), wrested Normandy, Maine, Anjou, Touraine, and Poitou from John of England and increased the power of the crown in other parts of France. He took a personal share in the Third Crusade and permitted the Pope to organize crusades against the Albigenses in the southern parts of the country. The power of the barons in the south was greatly weakened, and ultimately their territory was merged with the royal domains. By improvements in the administration of justice, the right of appeal to the royal courts was established, and the arbitrary power of the great vassals crippled. It was the policy of Philip Augustus to make use of the clergy and the jurists against the nobles, and it was the jurists especially who aided in the establishment of an absolute monarchy by their introduction of the principles of the old Roman law. Under Philip Augustus, France attained the leading place in Europe. The King knew how to win the friendship of the Pope without yielding to the papal pretensions. He was powerful enough to defeat Otto IV of Germany and his allies at Bouvines in 1214—a victory which secured his hold on the territories taken from King John. Improvements in the mode of administering the law were continued under his son, Louis VIII (1223-26), and his grandson, Louis IX (1226-70), who is one of the saints of the Catholic church. Louis IX engaged in the Crusades and died in an expe-

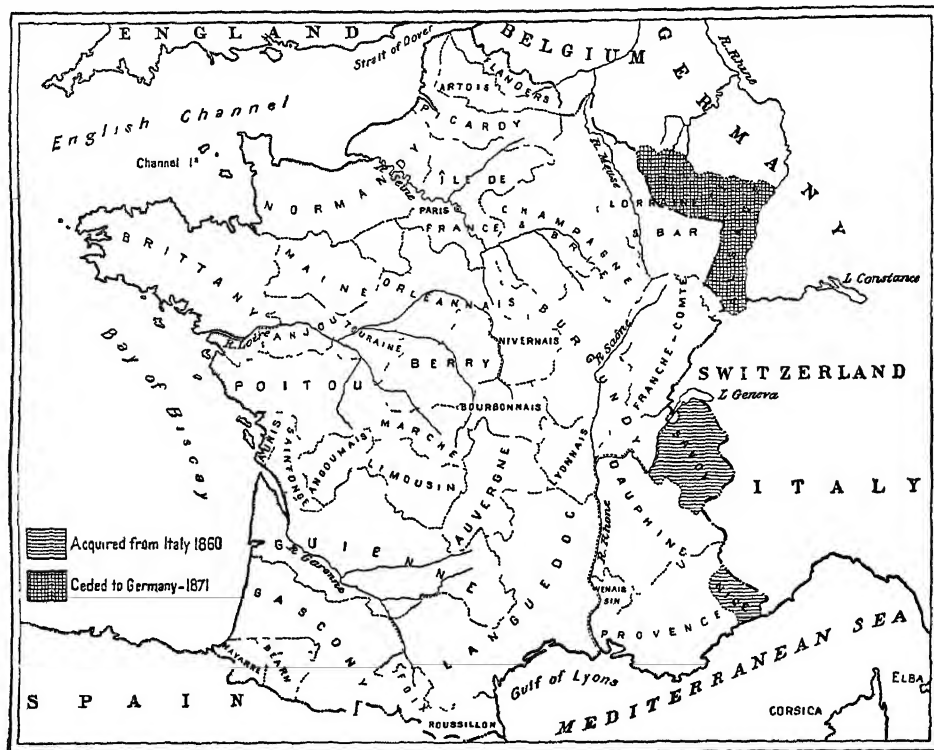

dition against Tunis. He effected many modifications in the fiscal department and left the kingdom stronger than ever before. His son, Philip the Bold (1270-85), annexed the County of Toulouse to the royal domains. Philip IV (1285-1314), surnamed Le Bel, or the Fair, acquired Navaire and Champagne by marriage and other territory by money or diplomacy. With a view to securing support against the secular and ecclesiastical nobility, with whom he was constantly at war, Philip gave prominence to the burgher element in the nation, and in 1302 he for the first time called together the *états généraux*, or general estates, at which the *tiers état*, or burgher class, appeared, together with the nobles and clergy. These changes were, however, accompanied by innovations in the fiscal and other departments of the government, which were effected with haste and violence. His tyrannical persecution of the Templars showed the extent to which the regal power could be stretched. At the same time the removal of the seat of the papacy to Avignon insured to France a predominant influence in European affairs. Under his successors, Louis X (1314-16), Philip V (1316-22), and Charles IV (1322-28), the last direct descendant of the Capetian line, the rule of the kings of France became even more unlimited. Philip VI (1328-50), the first of the house of Valois, a cousin of Charles IV and the nephew of Philip IV, ascended the throne in accordance with the Salic law (qv). His reign and those of his successors, John the Good (1350-64) and Charles V the Wise (1364-80), were disturbed by constant wars with Edward III of England, who laid claim to the throne in right of his mother, a daughter of Philip the Fair. The Hundred Years' War (qv) began in 1339. In 1346 the English won a great victory at Crecy. In the battle of Poitiers (1356) John was made captive, and, as the war dragged on, the state was reduced to bankruptcy, the nobility excited to rebellion, and the mass of the people greatly impoverished. Debasement of the coinage, onerous taxation, and arbitrary conscriptions brought the country to the verge of ruin, while the victories of England humbled the sovereign, decimated the French armies, and cut down the flower of the nation. The insurrection of the peasantry, known as the Jacquerie, occurred in 1358. The long and weak minority of Edward III's grandson, Richard II, diverted the English from the prosecution of their claims to the Kingdom of France, which revived somewhat from the effects of its long and disastrous warfare, but during the minority of Charles VI (1380-1422) the war was renewed with increased vigor on the part of the English nation, who were stimulated by the daring valor of Henry V. The signal victory won by the English at Agincourt in 1415, the treason and rebellion of the French princes of the blood who governed the larger provinces, the ambition of the several regents, the ultimate imbecility of the King, the profligacy of his Queen, and the love of pleasure early evinced by the Dauphin, all combined to aid Henry in his attempts upon the throne. But the premature death of Henry, the persevering spirit of the people, and the extraordinary influence exercised over her countrymen by the Maid of Orléans (see JOAN OF ARC), concurred in bringing about a reaction, and after a period of anarchy Charles VII the Victorious (1422-61) was crowned at Rheims. A fierce struggle,

however, had still to be waged for the recovery of the French provinces from the hands of the English, who were not driven out from Normandy and Guenne until the middle of the century, when nothing but Calais remained in their possession. Charles obtained from the States General a regular tax (*taille*) for the maintenance of paid soldiers to keep in check the mercenaries and marauders who pillaged the country. He laid the real foundation for the absolute power of the King by obtaining the support of the third estate.

It remained for his successor, however, completely to break the power of the great vassals of the crown and to lay upon the ruins of feudal anarchy the secure foundations of absolutism.

countered a formidable rival, who bade fair to erect between France and Germany a kingdom more powerful than either, but Charles fell in battle against the Swiss in 1477, and of his possessions the Duchy of Burgundy passed to France. Louis XI did not live to consolidate all of France under the crown, but before his death the royal power had been extended over Guenne, Burgundy, Provence, Anjou, Maine, and other regions.

Charles VIII (1483-98), by his marriage with Anne of Brittany, secured that powerful principality and consolidated the increasing power of the crown. His invasion of Italy in 1494 decided for all the future the relations of France to the other powers of Europe and may be re-

MAP OF FRANCE SHOWING FORMER PROVINCES

Louis XI (1461-83) brought to the task the manifold resources of a wily, unscrupulous nature, true to the moral type of the Renaissance and to those ideals of statecraft which Machiavelli was soon to formulate in his *Principe*. The essential meanness of his character and of his entire career was atoned for only by the inestimable benefits which he conferred upon his country. Soon after his accession to the throne the princes of the royal blood formed the League of the Public Weal against Louis, ostensibly in defense of the interests of the States General, but in reality out of fear of the growing power of the monarchy. Forced to yield in the beginning, the King soon turned their own weapon against them. The States General at Tours, in 1468, summoned to consider the question of reforms in the administration and the finances, revoked some of the concessions which the princes had succeeded in extorting from Louis in the Treaty of Conflans, three years before. In Charles the Bold of Burgundy Louis en-

gaged as marking the beginning of the modern era of international policy. With Charles VIII ended the direct male succession of the house of Valois (See VALOIS, HOUSE OF). Louis XII (1498-1515), known as "Le père du peuple," was the only ruler of the Valois-Orléans family. The tendency of his reign was to consolidate the royal power, while the general condition of the people was ameliorated. Louis XII engaged in bloody wars in Italy for the possession of Lombardy and the Kingdom of Naples, but failed to achieve any permanent conquests. His successor, Francis I (1515-47), of the Valois-Angoulême branch, still intent upon establishing French dominion in north Italy, waged endless wars with the Hapsburgs, which wasted the resources of his kingdom. A concordat with the Pope, signed in 1516, secured to the King the right of nominating the Gallican bishops. In the reign of Francis the Assembly of Notables superseded the States General. The arts and literature were encouraged in this reign, as well

as in that of the succeeding monarch, Henry II (1547-59), who continued the struggle with the Hapsburgs. The Emperor Charles V, who had warred successfully against Francis I, being crippled by the events which grew out of his war with German Protestants, Henry seized the opportunity to wrest the bishoprics of Toul, Metz, and Verdun from the German Empire and annex them to France. In this reign began the persecutions of the Huguenots (qv).

With the death of Henry II began a period of strife between factions which lasted for more than 30 years and brought upon France the full horrors of civil war. The three sons of Henry II—Francis II (1559-60), Charles IX (1560-74), and Henry III (1574-89)—were weak-willed and incapable, and the history of their reigns is the story of a ceaseless struggle for mastery on the part of the powerful house of Guise, carried on under the pretense of a war for religion. Opposed to them were the Huguenots, led at first by the Prince of Conde and the great Coligny and later by Henry of Navarre. Between the two, and playing off one against the other, was the gifted and unscrupulous Queen mother, Catharine de' Medici. Eight civil wars were fought in the space of a generation (beginning with 1562), wars in which the Huguenots did not hesitate to call in foreign aid against their enemies, nor both parties to employ perjury and assassination. The Massacre of St. Bartholomew (see BARTHOLOMEW, MASSACRE OF St.), perpetrated by Catharine de' Medici with the aid of the Guises, failed to crush the Huguenots and served only to increase the power of the Guise family, who, as heads of the Catholic League, sought to exclude Henry of Navarre, the rightful heir to the throne, from the succession. Henry III, who thought his own life and crown in danger, caused the Duke of Guise and his brother, the Cardinal of Lorraine, to be assassinated (1588), but perished himself by the assassin's knife in the following year, and the crown passed from the house of Valois.

The accession of Henry IV of Navarre (1589-1610), a Bourbon prince, descended from a younger son of St. Louis, allayed the fury of the religious wars, but his conversion to Catholicism estranged his own party, for whom, however, religious toleration was secured by the Edict of Nantes (1598). The early part of his reign was disturbed by mutinies of the troops and the rebellions of the nobles. By degrees, however, Henry, through the astute policy of his Minister, Sully, and by his own personal popularity, raised the power of the crown higher than ever, while he began a system of thorough administrative reform, which was arrested only by his death at the hands of the fanatic Ravallac in 1610. The first permanent French settlements in Canada were established under Henry IV.

During the first years of the reign of Louis XIII (1610-43), the government was in the hands of the Queen mother, Marie de' Medici. The year 1614 is noteworthy as the date of the last meeting of the States-General before 1789. After 1624 the real ruler of France was Cardinal Richelieu. His accession to power speedily put an end to the political intrigues which had disturbed the country during the regency of Marie de' Medici and the personal rule of Louis. Richelieu relentlessly repressed the risings of the Huguenots, who, under their ambitious leaders of the house of Condé, had

become a menace to the state. La Rochelle, the last of their places of refuge, was taken in 1628, and Protestantism as a political force ceased to exist in France. The Huguenots, however, were not molested in the free practice of their religion, as guaranteed by the Edict of Nantes. Abroad Richelieu carried on with marked success the contest against the house of Austria, which Henry IV was about to resume at the time of his death. The Thirty Years' War in Germany afforded him the opportunity. Gustavus Adolphus was maintained largely by French subsidies, and after 1635 it was French aid that made possible the victorious campaigns of Bernhard of Weimar, Banér, and Torstenson. Alsace was practically won by 1639, and (though Richelieu did not live to see this) by the Peace of Westphalia (1648). France was confirmed in the possession of the bishoprics of Alsace, and the bishoprics of Metz, Toul, and Verdun, and secured the right to intervene in the affairs of Germany as one of the guarantors of peace.

During the minority of Louis XIV (1643-1715) Cardinal Mazarin exerted the chief authority under the Regent, the Queen mother, Anne of Austria. The refractory attitude of the Parlement of Paris and the repression of the nobility gave rise to another civil war (see FRONDE), but with the assumption of power by young Louis (1661) a new era commenced. Supported by the financial ability of Colbert, who was a mercantilist, the military genius of Turenne, the engineering skill of Vauban, and the organizing talent of Louvois, Louis made France the great power of Europe. Franche-Comté and a part of Flanders were added to France by the Treaty of Nimeguen (1678). The ambitious schemes of Louis forced the powers of Europe in self-preservation to unite against him. Within, Louis reigned as absolute monarch, concentrating all the power of government in himself. The progress of the people in the arts of peace was accomplished with rapid strides. Under the inspiration of the *Grand Monarque* French society attained a degree of culture and refinement that had not been known even in the days of the Italian Renaissance. This, too, was the golden age of French literature. The French language and customs exercised an immense influence on the manners of the higher classes throughout Europe, being not the least potent in distant and barbaric Russia. The court of Louis XIV became the model for European princes. There was, however, a dark side to the picture. The oppressive war taxes, the prodigality of the court, the luxurious lives of the clergy, and the absolutism and bigotry of the aged monarch combined to undermine the foundations of national prosperity and freedom. The latter part of Louis XIV's life was marked by a long series of misfortunes. The French armies were repeatedly defeated, the prestige of France was destroyed, and only the jealousy of its enemies saved it from utter humiliation. The War of the League of Augsburg (1689-97) was marked by the defeat of the French in the naval battle of La Hogue (1692), which wrested from them the mastery of the seas. With the outbreak of the War of the Spanish Succession (see SUCCESSION WARS) came the downfall. Louis XV (1715-74) succeeded to a heritage whose glory was tarnished and to a throne whose stability was shaken to its very foundations. The reign of Louis XV presents nothing worthy of notice

except the acceleration in the process of dissolution of the monarchy and the development of revolutionary influences. The regency of the profligate Duke of Orléans brought the nation to the verge of bankruptcy (See LAW, JOHN). The struggle with England in the Seven Years' War (qv) stripped France of Canada and Louisiana, while the capricious change of policy which the King's mistresses, Madame de Pompadour and Madame du Barry, forced upon the governments brought contempt upon the country. During this reign the Order of the Jesuits, over which there was much controversy, was banished from France (1764). In 1774 Louis XVI, a well-meaning but weak prince, succeeded to the throne and to the consequences of all the errors of his predecessors. His first ministers, Maurepas, Turgot, and Malesherbes, failed in their attempts to carry out the necessary reforms and were compelled to yield to the intrigues of the nobility and higher clergy and resign their places. They were succeeded by the financier Necker, who endeavored by economy and method to arrest the impending bankruptcy of the state, and succeeding ministers (Calonne, Lomènie de Brienne) made futile attempts to diminish these financial disorders by new forms of taxation, which were generally opposed by the court. The nobles, the clergy, and the third estate were alike clamorous for a meeting of the States General, the privileged estates wishing to impose new taxes on the nation, and the third estate determined to inaugurate a thorough and systematic reform, especially of the land system. After much opposition on the part of the King and court, the States General, which had not met since 1614, assembled at Versailles on May 5, 1789.

France was ripe for revolution. Thoroughgoing reforms at the beginning of Louis XVI's reign might have averted the catastrophe, but a vacillating King, and ministers strong enough to aspire after the good without the power to achieve it, had served only to intensify the feeling of universal discontent, and to bring out in greater contrast than ever the irreconcilable antagonism between the new spirit of the age and the antiquated forms of government and society in France. In other countries of Europe the condition of the lower classes was as unhappy; the incapacity of government as apparent, the survival of feudal customs as oppressive as in France, but in France alone had the newer intellectual life developed such activity as to render it incompatible with the continued existence of ancient institutions. Absolutism in France had been developed at the expense of feudal rights and popular liberties and had drawn to itself almost all the functions of national life, but absolutism since the time of Louis XIV had failed in its duty to the nation, and appears in the ancien régime as a ponderous, rusty machine, making itself felt chiefly by its weight.

Under the old régime the internal administration of the country rested in the hands of the King's Council and of the Comptroller General. Finance, justice, and legislation were all under the control of this powerful Minister, who acted in conjunction with various subsidiary councils. The country was divided into 32 provinces or generalities, each under an intendant, who was the agent of, and responsible to, the Comptroller General. Except in the *pays d'état*, where the local magistrates retained some measure of

self-government, the intendant united in himself the various functions of administration: police, public works, the care of the poor, and, chief of all, taxation. Through his subdelegates he collected every year the amount of the *taille* and other direct taxes assessed upon the province by the King's Council. The process of administration was cumbersome. Minute matters of local importance had to be passed upon by the Comptroller General in Paris, and, as a result, the provincial administration, though meaning probably to be neither harsh nor unjust, succeeded for the most part in being both.

Socially the people of France were divided into two great classes—those who paid the *taille* and those who did not. Among the latter were the nobility, numbering some 140,000 souls and owning about one-fifth of the soil. They held exclusive possession of the high offices at court; they were exempt from the *corvée*, or forced work on the roads, and from service in the militia. Originally exempted from payment of the *taille* because it was regarded as a commutation paid by the lower classes in lieu of military service, the nobles retained their exemption long after they had ceased to render military service. In the payment of indirect taxes they also succeeded in evading a large part of their share. For the nobles there were the old privileges and immunities, the ancient rights of fines and dues and tithes, of hunting and fishing and warren, of toll on mill and wine press, but the ancient service of protection and of guidance to the vassal was gone. A distinction, however, should be made between the court nobility, who lived in magnificence at Paris or Versailles and aided in heaping up the enormous deficit with which the extravagance of the court was weighing down the country, and the country nobles, who constituted the great body of the class and lived in retirement on their estates, poor, inactive, since absolutism would make no use of them as its agents, and a burden, though very often an unwilling burden, to their tenants. The church comprised some 60,000 monks and nuns and 70,000 of the secular clergy out of a total population of about 23,000,000. Between the prelates of the church and the great body of the poor priests was the same gulf that separated the court nobility from the resident nobles. The mass of the French priesthood was unselfish, devoted, zealous in its duties, but among the higher clergy, the archbishops and bishops, there were many who were no less selfish and ambitious than the nobility. Like the nobility, they were eager to escape their fair share of taxation and hungered after dues and tithes. The church owned about one-fifth of the land in France and, with the nobility and the crown, shifted its burdens upon the remaining two-fifths. Privilege ruled also in the middle classes. In the towns the line of cleavage between the bourgeoisie and the artisan population was definite. Trade and industry were regulated by the guilds after the selfish spirit of mediæval times. Municipal offices were put up by the government for sale and, as they generally carried with them certain privileges and immunities, chief among them relief from taxation, were greatly sought after. Powerful corporations were as assiduous in swearing off taxes as their modern successors. The rich bourgeoisie, in short, vied with the nobility and the church in evading the burdens of state.

It was upon the peasantry, then, that the full

brunt of taxation fell Serfdom was almost extinct in France, more than one-fifth of the land was held by peasant proprietors, and, strangely enough, throughout the eighteenth century more and more land passed into the hands of the peasants in spite of the almost intolerable exactions imposed upon them. Yet Taine has calculated that four-fifths of the fruits of the peasants' labors were taken away by the government in the form of *taille*, *corvée*, poll tax, *vingtièmes*, the *gabelle*, or salt tax, internal revenue, and tariff duties. The lands of the church and of the nobles were cultivated by the peasants under the *métayer* system, where the owner supplied the stock of implements, and the peasant the labor, both sharing equally. The general state of agriculture was wretched. The methods pursued were those of the early Middle Ages, want was the chronic condition of the working population, famine a frequent phenomenon, and mendicancy increased to an enormous extent. In 1777 there were 1,250,000 beggars in France. Rioting was frequent, and the criminal class drew recruits in plenty from among the proletariat of town and country.

Against the critical and utilitarian spirit of the eighteenth century the irrational and antiquated in government and society could not hope to maintain itself. Absolutism was assailed by Montesquieu in his *L'Esprit des lois*, which held up the ideal of constitutional liberty as realized in Great Britain. Voltaire waged a ceaseless warfare of keenest ridicule and biting wit against the absurd and anomalous in church, state, and society. Rapidly the conviction grew of the utter worthlessness of existing things and of the necessity for immediate and radical change. The revolt against the actual attained its climax in Rousseau. In the face of privilege, injustice, and oppression, he invoked the law of nature to establish the equality of man. To the peasantry and the artisan class equality meant the just redistribution of public burdens; to the cultured, ambitious bourgeoisie, an equal opportunity with the nobles for sharing in the national life. "Liberté, Egalité et Fraternité" became the watchword of the downtrodden French peasants.

For an account of the period from 1789 to 1799, see FRENCH REVOLUTION, THE.

Bonaparte showed consummate skill in reorganizing and centralizing the government, which had been too much localized under the Revolution. He then took the field in the spring of 1800, led an army over the Alps, and attacked the Austrians in Italy, while Moreau was intrusted with the conduct of the campaign in southern Germany. The victories of Marengo and Hohenlinden decided the fate of the war. In 1801 the Peace of Lunéville was concluded with Austria and the German Empire, and the boundaries of France were extended to the Rhine. In the Peace of Amiens in 1802, England recognized the changes wrought by the Revolution and Bonaparte in the map of Europe. The period of respite from war was employed by the First Consul in revivifying trade and industry and in obliterating, both in private and public life, the devastations wrought by the Reign of Terror. In 1804, after an appeal through universal suffrage to the nation, Bonaparte became Emperor, as Napoleon I. The Pope came to Paris to crown Napoleon and his wife, Josephine, a new nobility was rapidly created, and the relatives and favorites of the

Emperor received vanquished kingdoms and principalities at his hands. In 1805 Napoleon assumed the title of King of Italy. Austria, which ventured to rise up against him, was overthrown, together with her ally, Russia, at Ulm and Austerlitz (1805), and compelled to sign the Peace of Pressburg, by which the existence of the Holy Roman Empire was formally brought to an end (1806). Prussia was humiliated at Jena and Auerstadt (1806) and brought to the verge of destruction, the Russians were overthrown at Friedland (1807), and the Czar was forced to enter into an alliance with the French Emperor (Treaty of Tilsit, 1807), by which the arbitrament of affairs in Europe was divided between the two. In the meanwhile, however, England, having renewed the struggle against France, had gained the complete mastery of the seas by the victory of Trafalgar (1805). Against this archenemy Napoleon brought to bear the united strength of Europe in an effort to destroy her commercial supremacy by a system of ruinous blockades (See CONTINENTAL SYSTEM). In 1807 the forces of Napoleon invaded Portugal and expelled the reigning family. In 1808 he took possession of Spain, whose inhabitants rose against him, and which became a great battlefield between the English and French. We see here for the first time a national war in Spain as opposed to the dynastic wars of the past. Napoleon's inability to gain control of the situation in Spain was one of the most potent causes of his subsequent downfall. The height of Napoleon's power was attained in 1809, when the Austrians in a third war were overthrown at Wagram and in the Treaty of Schonbrunn suffered a further loss of territory. By his marriage with the Archduchess Maria Louisa, daughter of the Emperor of Austria, Napoleon attempted to give to his throne the prestige of birth, which alone it lacked. For some years, while his military operations were confined to the Spanish peninsula, Napoleon could devote his energies towards consolidating his government and organizing a thoroughly centralized administration. His impress on the character of French institutions has persisted to the present day. The legal system of France is based primarily on the Code Napoléon (1804), and the relations between church and state up to 1906 were largely determined by the Concordat which the Emperor concluded with the Pope in 1801. The period was one of noted intellectual progress. Chateaubriand and Madame de Staël gave the initial impetus to the romantic movement in literature and in the field of science stand out the names of Bichat, Lamarck, and Laplace.

The disastrous Russian campaign of 1812 was the beginning of Napoleon's downfall. Of the grand army of more than 500,000 men which he led into Russia in June, only 100,000 recrossed the Niemen in December under the command of Murat, the Emperor having hastened to France to raise new levies. Europe now rose against the conqueror. In February, 1813, Prussia entered into an alliance with Russia, and these powers were soon joined by Austria and Sweden. Napoleon defeated the Russians and Prussians at Lutzen and Bautzen in May and gained a splendid victory over the Allies at Dresden in August, but in October he was overwhelmed in the great battle of Leipzig. He was driven from Germany, France was invaded, and on March 30 Paris surrendered to the Allies.

Napoleon was compelled to abdicate and retired to the island of Elba, the sovereignty of which had been granted to him. His family were declared to have forfeited the French throne. Of all her conquests France was allowed to retain only a few strips of territory on her eastern border, together with Avignon and Venaissin. On May 3 Louis XVIII, the brother of Louis XVI, made his entry into Paris, and the period of the First Restoration began.

The conduct of the restored Bourbons was not such as to conciliate the nation; they returned loaded with debts, and surrounded by the old nobility and clergy, who had not learned to renounce their former privileges, and who looked upon the generation of Frenchmen which had arisen during their absence as their natural enemies. The hopes of a liberal government, aroused by the granting of a constitution in the *Charte Constitutionnelle* (June 4, 1814), failed of realization. A narrow spirit influenced the policy of the King, which led to the establishment of a strict censorship, the extension of the powers of the police, and the persecution of all the adherents of the Empire. The lower classes and the army, who were alike sensible of the humiliating reaction which had followed the former excitement of war and conquest, were treated by the returned émigrés with indifference and contempt. The general discontent with the monarchy afforded the exiled Emperor an opportunity of which he was not slow to avail himself. On Feb. 26, 1815, Napoleon left Elba, and on March 1 he landed in France. Crowds followed him, the soldiers of the Empire flocked around his standard, and the Bourbons fled before him. The news of his landing spread consternation throughout Europe. The deliberations of the Congress of Vienna (qv) were suspended, and on March 25 a treaty of alliance was signed at Vienna between Austria, Russia, Prussia, and England, and preparations were at once made to put down Napoleon and restore the Bourbon dynasty. At first the prestige of success seemed to attend Napoleon, but on June 18 he met his final defeat at Waterloo (qv). On July 8 Louis XVIII reentered Paris. A week later Napoleon gave himself up to the English and was sent to the island of St. Helena, where he died in 1821.

The Second Restoration gave occasion to many pledges of a more liberal policy on the part of Louis, but these were disregarded in the Royalist reaction that now set in. In spite of the King's promises of amnesty, many of those who had gone over to Napoleon during the Hundred Days were brought to trial before tribunals expressly instituted for that purpose. The most prominent of the victims was Ney, who was found guilty of treason, and shot Dec. 7, 1815. A number of peers, created by Napoleon, were expelled from the Upper Chamber. In some of the provinces the adherents of the Bourbons entered upon a course of violence and murder, the so-called "White Terror." Long after physical violence subsided, reactionary legislation went on. The suffrage law was repeatedly tampered with, until the preponderance of power had been placed in the hands of the great landowners. In matters of public education the King was completely under the control of the clergy, who constituted the extreme party among the reactionists. In 1824 Louis XVIII was succeeded by his brother, the Comte d'Artois, as Charles X. Ministerial incapacity, want of good faith, general discon-

tent, and tendencies to absolutism characterized this reign, which was abruptly brought to a close by the revolution of July, 1830. With Charles X the direct line of the house of Bourbon came to an end. Louis Philippe, Duke of Orleans, was elevated to the throne by the will of the people. He became King of the "French," not of "France." The first years of the reign of this "Citizen King," who was the representative of the prosperous commercial and industrial classes, were disturbed by insurrectionary riots of the silk weavers in Lyons and disturbances in Paris. Attempts on the King's life were frequent, but the progress in material prosperity made the government popular with the bourgeoisie, and for a time it held its ground. The warlike propensities of the nation found an outlet in the conquest of Algeria (1830-47). But the determined resistance of the King to the growing demand for electoral reform led at last to open insurrection in Paris. Louis Philippe abdicated, Feb. 24, 1848. A provisional government was at once instituted, including such men as Dupont de l'Eure, Lamartine, Ledru-Rollin, Etienne Arago, Crémieux, and Garnier-Pagès. On February 27 the Second Republic was formally proclaimed. Under the auspices of Louis Blanc the new government proceeded at once to exert the activities of the state in behalf of the working classes, for whom it was proposed to establish national workshops. On April 27 a decree was issued abolishing slavery in the French colonies. In the mean while elections were held for a Constituent Assembly, which met on May 4, and which a few days later elected an Executive Commission to conduct the affairs of the Republic. The radical Republicans (the so-called Red Republicans) and the disappointed Socialists soon manifested their hostility to the new order by a resort to arms. There were Red Republican disturbances in Paris on May 15, and a great Socialistic uprising in the capital, June 24-26, in which a large mass of the Parisian populace was involved, was suppressed by General Cavaignac only after terrible bloodshed. On November 4 the Constituent Assembly completed the framing of a regular republican constitution for France, and on Dec. 10, 1848, Louis Napoleon, nephew of Napoleon I, was elected President, entering upon his office December 20. One of the first acts of the administration of Louis Napoleon was the sending of a French expedition for the restoration of the temporal power of Pope Pius IX, which was accomplished in July, 1849. In May, 1849, the Constituent Assembly closed its sessions and was succeeded by the Legislative Assembly. The President betrayed the true nature of his policy by appointing, on Oct. 31, 1849, a thoroughly Bonapartist ministry. (See NAPOLEON III.) By the famous coup d'état of Dec. 2, 1851, he violently set aside the constitution and assumed dictatorial powers. He adopted his uncle's methods in many ways, concealed his seizure of the title by a sham plébiscite, and became Emperor of the French, Dec. 2, 1852.

Napoleon III established a government which was virtually a perfected absolutism, veiled by the forms of a parliamentary régime and a system of universal suffrage controlled by the agents of the Emperor. There was a Senate, which was the guardian of the constitution, and a legislative body, but the Senate was almost entirely appointed by the Emperor, and in the

Lower House there was no freedom of debate. The freedom of the press was practically abolished. Force, however, could not be depended upon as a permanent sanction of legitimacy, and to secure the support of the people it was necessary for Napoleon to enter upon a brilliant foreign policy. The alliance of England and France against Russia in 1854 and the outcome of the Crimean War were personal triumphs for the Emperor. With the meeting of the Congress of Paris in 1856 that city became the diplomatic capital of Europe. The Emperor aspired now to play the rôle of arbiter of Europe. In 1859, as the champion of oppressed nationalities, he came to the aid of Italy against Austria and as a reward obtained possession of Savoy and Nice. He failed, however, in his attempt at intervention in Poland in 1863 and in the affair of Schleswig-Holstein in the following year. Actuated, perhaps, by the dream of a French hegemony in Latin America, he seized upon the disturbed condition of Mexico as an opportunity for invading that country and establishing a dependent empire there under Maximilian of Austria. The fall of Maximilian's Empire in Mexico was a fatal blow at his prestige. The defeat of Austria in 1866 and the consequent rise of Prussia threatened to deprive France of the leading position she occupied in European affairs. At home, the period of the Second Empire was marked by great industrial development. Schools, banks, and cooperative societies sprang up all over France. Trade with America and other foreign countries was enlivened. Stimulated by the magnificence of the court, life took on an aspect of almost reckless luxuriousness. Vast fortunes were made in railroad building, government contracts, and speculation. A great system of public works was carried out, including the building up of a new and beautiful Paris. (See HAUSSMANN.) The international exhibitions of 1855 and 1867 testified to the prosperity of the country. Nevertheless, signs of dissatisfaction were not wanting, and after 1863, in proportion as Napoleon's foreign policy broke down, discontent and criticism grew loud in France. As early as 1862 the Emperor was compelled to allow some measure of debate in the legislative bodies, and in 1867 this was largely increased. Opposition to the Empire, however, grew bolder and fiercer, until in 1869 the Emperor saw himself driven to grant a responsible ministry. It was soon found that the responsibility of the ministry was fictitious, and that the Emperor availed himself of its protection to cloak his own acts of personal government. The result of the appeal made to the nation in 1870, on the plea of securing its sanction for his policy, was not what he had anticipated, and the 50,000 dissentient votes given by the troops in this plébiscite revealed a hitherto unsuspected source of danger. The necessity, however, of regaining his lost prestige by a brilliant foreign policy led him to enter once more upon an aggressive course of action in European affairs. The question of the succession to the vacant Spanish throne precipitated a crisis between France and the Prussian government, whose foreign policy was guided by the genius of Bismarck. Deceived by the false representations of his ministers with regard to the efficiency and preparedness of the French army, Napoleon allowed himself to be carried into war with a power which but recently (see SEVEN WEEKS' WAR) had revealed its surpassing mili-

tary strength and had been silently preparing for the decisive conflict with France. Rarely has the bubble of power been so suddenly pricked as in the case of Imperial France in 1870. (See FRANCO-GERMAN WAR OF 1870-71.) After a quick succession of utter defeats for the French, Napoleon surrendered at Sedan, Sept. 2, 1870. On September 4 the Corps Legislatif declared the Emperor and his descendants forever excluded from the throne and created a Government of National Defense. France was proclaimed a republic. A period of stress and disorder ensued. An armistice in January, 1871, was followed by the meeting of the first National Assembly of the Third Republic at Bordeaux in February. The preliminary treaty of peace with Germany was signed at Versailles on February 26 and ratified by the National Assembly on March 1. France agreed to cede Alsace, together with parts of Lorraine, including Metz, and to pay an indemnity of 5,000,000,000 francs. Not until the final payment of the enormous war indemnity in September, 1873, was France wholly freed from the humiliating occupation by foreign troops. (See PARIS.) In the spring of 1871 the violent outbreak of the Commune (qv), who feared the Assembly was hostile to the Republic, convulsed France, but was suppressed with rigorous severity. On Aug. 31, 1871, Thiers, who had been elected Chief of the Executive by the National Assembly in February, received from that body the title of President of the Republic.

There was not for years a true republican majority in France, but the adherents of the Republic were able to hold their own because of the divisions in the ranks of the Monarchists. (See POLITICAL PARTIES, France.) In 1873 Thiers resigned the presidency, and Marshal MacMahon was elected by Monarchist votes and confirmed in the presidency for a period of seven years (the Septennate). Finally, in 1875 the Assembly adopted laws providing for the constitution of the National Legislature, the legislative power to be vested in a Senate and a Chamber of Deputies. On account of the increase of Republican strength in the Chamber of Deputies, MacMahon resigned in 1879, and Jules Grévy was elected to succeed him.

After 1879, under various changes of ministry, the policy of the government continued steadily republican. At the instance of Jules Ferry a decree was issued in 1880 by which the Jesuit schools were closed, and all religious orders that would not submit to certain conditions necessary to gain the state sanction were dissolved. In 1884 the constitution and the senatorial electoral system were revised and put upon their present basis. Labor unions were legalized. Members of the royal houses that had formerly ruled France were declared ineligible for military or civil office. In 1881 France entered upon an active colonial policy by undertaking a military expedition to Tunis and establishing a protectorate over the country. In 1883 France enforced a claim of certain rights over the northwestern part of Madagascar by taking possession of several ports. Rapidly extending its influence in spite of considerable reverses, it succeeded in establishing a protectorate over the island in 1885, and in 1896 reduced Madagascar to the rank of a French possession. The advance of France in Indo-China led to war with China in 1884, which resulted in the establishment of a French protectorate over Annam and

Tongking M Grévy was reelected in 1885, but resigned in 1887. He was succeeded by Sadi Carnot, in whose administration the Panama Canal scandal occurred, involving many prominent men and weakening the government.

The Carnot administration, too, witnessed the most formidable of all the attempts made to overthrow the Third Republic. This was the agitation fostered by the members of the Orleanist, Legitimist, and Bonapartist parties, under the leadership of General Boulanger (1888). For a time it seemed as if the Republic was fated to fall before a coup d'état. Boulanger, however, lacked the requisite decision of character, lost his popularity, and ultimately fled the country. As a result, there was a very strong reaction in favor of the government. This growth of republican sentiment received an additional impulse in 1893, when the Pope urged the clergy to accept the Republic. This was a great blow to the Royalists, whose chief strength has always lain in their connection with the church. In 1894 President Carnot was assassinated at Lyons by an Italian anarchist and was succeeded by Casimir-Perier, who resigned in January, 1895, and was succeeded by Félix Faure. In the administration of the latter and that of Emile Loubet (qv), who was elected President on the death of Faure in 1899, fell the celebrated Dreyfus case, which divided the nation into two hostile camps and for a time seemed to threaten the downfall of the Republic. (See DREYFUS.) The crisis was safely weathered under the able guidance of Waldeck-Rousseau (qv), who became Premier in 1899. He formed a cabinet containing representatives of all the radical parties, the Republicans of the Left, the Radicals, the Radicals-Socialists, and even the Socialists themselves, whose spokesman was Millerand (qv). His advent into the ministry was a striking indication of the growing strength of the Socialist party. This cabinet of "re-concentration" or of "national defense," representing as it did greatly divergent political and economic principles, was held together by the sole necessity of defending republican institutions against the machinations of royalists and reactionaries who were striving to turn the army against the Republic. The Dreyfus crisis had demonstrated that in the clerical influence the existing régime had one of its most formidable enemies, and the first year of the twentieth century witnessed in consequence the inception of a strong anticlerical government policy.

The Associations Law of 1901 brought religious congregations under government supervision, and when Waldeck-Rousseau retired in 1902 after the longest ministry since 1871 the anticlerical campaign was carried on with increased vigor by his successor, Combes (qv), who set himself the task of wresting the control of education from the religious congregations on the ground that the clerical schools devoted themselves to instilling into the minds of their pupils sentiments hostile to the Republic. Indeed, with the accession of Combes the policy of "national defense," initiated by Waldeck-Rousseau, came to take on aspects of repression.

But though the Combes ministry fell in the early part of January, 1905, the Rouvier ministry, which succeeded, pledged itself to carry out its religious programme, which possessed the support of a majority of the nation. The hostile attitude of the new Pope Pius X towards the policy of the Combes ministry had given

rise to a demand for the total separation of the churches from the state and a bill to that effect had been introduced by Combes. A somewhat more moderate measure was passed by the Chamber of Deputies on July 3, 1905 and by the Senate on December 6, and was promulgated three days later. It suppressed the budgets of public worship and thus put an end to the Concordat established by Napoleon I in 1801-02, substituting instead a system of associations for religious worship receiving no aid from the state and subject to the general provisions of the law dealing with corporations. See paragraph on *Religion* above.

In 1891 France broke the isolation that had surrounded her since the Franco-German War by contracting an alliance with Russia, thus offsetting the importance of the Triple Alliance, and in 1897 it was formally announced that a treaty had been signed. From 1899 to 1906 foreign affairs were in the hands of the astute diplomatist, Theophile Delcassé (qv). He strengthened the alliance with Russia, established cordial relations with Italy, thereby weakening the Triple Alliance, and crowned his labors with the Anglo-French Agreement of April 8, 1904, whereby the two powers were brought into a close *rapprochement*. In this agreement France abandoned its Newfoundland shore rights in return for a money compensation and territorial concessions in West Africa, and recognized the predominant position of Great Britain in Egypt in return for acknowledgment by the latter of the right of France to maintain order in Morocco and to assist the Moroccan government in improving the administrative, economic, financial, and military condition of the country. The downfall of Russia in the Far East left France for a time without an open ally in Europe, and the opportunity was seized by Germany in 1905 to force the dismissal of Delcassé, whose policy of alliances the German government regarded as aimed against itself. The Algeiras Conference, which met in 1906 to consider the situation in Morocco, decided that France should be given certain customs rights on the Algerian frontier, and Spain similar privileges in the Riff country. An international police force was also provided for, but never organized. Germany caused trouble, both in 1908 and in 1911, by protesting that the French sphere of influence was too extensive. The situation in the latter year appeared decidedly dangerous, as Emperor William had sent a warship to Agadir to protect German interests, but through the firm policy of Raymond Poincaré, who had succeeded Caillaux as Premier, coupled with the strong support of England, France emerged from the controversy with her rights to Morocco once more admitted by Germany. In return for this recognition France ceded to Germany 112,000 square miles of the French Congo. By a treaty with the Sultan of Morocco in 1912 France secured a practical protectorate over that country, with the exception of the northern fringe under the control of Spain.

A feature of the French situation of the past decade has been the growth of industrial unionism. (See SYNDICALISM.) Many Socialists who were not in accord with the opportunist methods of Jaures, the Socialist leader, came into the ranks of the direct actionists. The relation of the government to these unions has been a prominent factor in government policies and politics. The postal employees declared a

strike in 1909, but were induced to go back to work. A general railway strike occurred during the following year on government as well as on private lines and disorganized the railway system of France. Premier Briand, himself a Socialist, 'summoned the strikers in their capacity as military reserves, and compelled them to man the roads under threat of military punishment. This broke up the strike. A profound change in domestic legislation was begun in 1910 by the passage of an Old Age Pensions Act.

Premier Poincaré was elected President in 1913, and it was the general belief that the choice of this strong man would mark an increase in the powers of the President. Poincaré was the leader of the party that was in favor of a firm foreign policy, accompanied by internal development. Aiming to do away with excessive localism, the Moderates were strongly in favor of electoral reform providing for the election of deputies by the *scrutin de liste* (which makes the department and not the arrondissement the district which elects, rendering the deputies more widely representative than now), with provision for minority representation. This proposal was opposed by the Radical Left, led by Clémenceau and Caillaux, as they believed it would augment the power of the clerical party.

A plan to increase the size of the army was passed by the Barthou ministry, in August, 1913, providing for a return to the requirement of three years' military service with no exemptions. A conference of the Left at Pau in October of that year attacked the militarist policy of the government and declared for two years' service, which had prevailed before the passage of the three years' bill. The fall of the Barthou ministry, however, was not accompanied by a repeal of the act. Both the Doumergue and Viviani ministries were more anticlerical than antimilitarist. This was doubtless due to the influence of Clémenceau, who, though a member of the Left, was nevertheless an ardent supporter of the three years' clause. Premier Viviani indeed declared that change in the three years' act was impossible until the proposed substitutes, such as military training among youths and the utilization of reserves, proved their efficiency.

The disturbances, during the closing months of 1913, in Alsace-Lorraine, particularly at Zabern, fanned again the hostility between France and Germany. The stationary condition of the population of France is significant when compared with Germany. In 1911 the population was only 39,601,509, as compared with 27,349,003 in 1801 and 36,905,788 in 1876. The annual increase has lately been less than 0.2 per cent, while Germany had an average annual increase for the decade 1900-10 of 1.36 per cent. This disparity was indeed one of the chief causes for the passage of the three years' service act. For an account of events following the outbreak of the great War of 1914, see WAR IN EUROPE.

Of general historical works the best are Duruy, *Histoire de France*, trans by Carey (New York, 1889); Martin, *Histoire de France* (Paris, 1855-60); Guizot, *Histoire de France* (ib., 1870); Kitchin, *History of France to 1793* (3d ed, Oxford, 1894); Adams, *The Growth of the French Nation* (New York, 1896); Lavisse, *Histoire de France* (9 vols, Paris, 1901-11). Bibliographies for special periods may be found in Lavisse and Rambaud, *Histoire générale* (ib., 1893-1900); Monod, *Bibliographie de l'histoire de France* (ib., 1888); *Cambridge Modern History* (12 vols, New York, 1903-12); and under special titles relating to French history in this ENCYCLOPÆDIA. For the period of the Reformation, Baird's histories of the Huguenots are of great value. For the seventeenth, eighteenth, and nineteenth centuries, consult Sorel, *Lectures historiques* (Paris, 1894), and the works by James B. Perkins, and Moise-Stephens, *History of the French Revolution* (New York, 1886). Other works are Adams, *Democracy and Monarchy in France* (ib., 1884), and Von Holst, *The French*

Revolution, Tested by Mirabeau's Career (Chicago, 1894). Valuable especially for the relation of the Revolution to European affairs are Sorel, *L'Europe et la révolution française* (Paris, 1892), and Sybel, *History of the French Revolution*, trans by Peiry (London, 1867-69). The works of De Tocqueville, Louis Blanc, Taine, Mignet, and Arthur Young are also to be quoted in this connection. For works relating especially to Napoleon, see NAPOLEON I. On France in the nineteenth century the leading authorities are for external affairs, Viel-Castel, *Histoire de la restauration* (20 vols, Paris, 1860-78), for internal affairs, Hauwange, *Histoire du gouvernement parlementaire en France, 1814-1848* (ib, 1860-72), covering the period to 1830, Hillebrand, *Geschichte Frankreichs* (Gotha, 1877-79), to 1830, monarchical in tone but scientific, Delord, *Histoire du second empire* (Paris, 1870), Bulle, *Geschichte des zweiten Kaiserreichs und des Königreichs Italien* (Berlin, 1890), Zévort, *Histoire de la troisième république* (Paris, 1898), a valuable scientific history, Cubertin, *The Evolution of France under the Third Republic*, trans by Haggood (New York, 1897), id, *France since 1814* (ib, 1900), Anderson, *Constitutions and Other Select Documents Illustrative of the History of France, 1789-1907* (Minneapolis, 1908). Among the later works are Molnér, *Les sources de l'histoire de France* (Paris, 1901-06), Levrault, *L'Histoire de France* (ib, 1905), Seignobos, *Cours d'histoire* (ib, 1909), Olivier, *L'Empire libéral* (17 vols, ib, 1897-1909), Hanotaux, *Contemporary France* (4 vols, New York, 1909), Bracqu, *France under the Republic* (ib, 1910), Vizetelly, *Republican France* (Boston, 1913), Sabatier, *France To-Day* (New York, 1913), Guérard, *French Civilization in the Nineteenth Century* (ib, 1914), Moreton Macdonald, *History of France* (ib, 1914), A Hassall, *France, Medieval and Modern* (Oxford University Press, 1918), Poincaré, *How France is Governed* (New York, 1919), A B Dodd, *Up the Seine to the Battlefields* (New York, 1920), A L Guérard, *French Civilization from its Origins to the Close of the Middle Ages* (New York, 1921), S S V Lauzanne, *Great Men and Great Days* (New York, 1921), E C Price, *Stories from French History* (New York, 1921), J Bridge, *History of France from the Death of Louis XI* (Oxford University Press, 1922). Consult also the names of persons, parties, places, etc., as LOUIS XIV, DANTON, GIRONDISTS, BRUMAIRE, NAPOLEON I, AUSTRALITZ, ALGERIA, COMMUNE, ETC. See also POLITICAL PARTIES. See SUPPLEMENT.

FRANCE, frans, ANATOLE (1844-1924). The assumed name of Jacques Anatole Thubault, a noted French critic, generally recognized as the most distinguished novelist, the most graceful humorist, the most mordant ironist, and the purest stylist of contemporary France. His early work, *Poèmes dorés* (1873), the verse drama *Les noces corinthiennes* (1876, produced in 1902), and the humorous story, *Jocaste et le chat margre* (1879), do not rank high, but *Le crime de Sylvestre Bonnard* (1881, often translated) is a charming idyl of child and scholar's life, full of genial irony that grows more caustic in *Balthazar* (1889), while in *La rôtisserie de la reine Pédauque* (1893) and *Opinions de M l'abbé Jérôme Coignard* (1893) the story is little more than a veil for the expression of an epicurean skepticism. A group of four stories, *L'Orme du mail* (1897), *Le man-*

nequin d'osier (1898, dramatized in 1904), *L'Anneau d'améthyste* (1898), *Monsieur Bergeret à Paris* (1900), frankly call themselves *Histoire contemporaine* and seek to reflect the thoughts of typical Frenchmen of culture. All these and his other novels as well, eg, *Thais* (1890), *Le lys rouge* (1894), *Histoire comique* (1903), and his social drama *Crainqueballe* (1903), are the work of an impressionist critic rather than of a creative talent, and his journalistic reviews, *La vie littéraire* (5 vols, 1888-93), as well as his philosophic *Le jardin d'Epicure* (1895), show more of the spirit of Renan than that of any other. His most delightful confession probably best reveals the secret of his charm for the present generation. "To be frank, the critic should say 'Gentlemen, I intend to speak of myself apocryphos of Shakespeare, Racine, Pascal, or Goethe'." And yet this quiet bibliophile, scholar, and virtuoso of French prose displayed the greatest courage when, braving the inflamed prejudice of the multitude, he defended the oppressed Dreyfus (qv). In other matters, also, he had the courage of his convictions, witness his championship of socialism in *Opinions socialistes* (1902), in *Sur la pierre blanche* (1905), and elsewhere. In 1896 he was elected to the Academy. Other of his works are: *Histoire de dona Maria d'Ayolas et de don Fabricio* (1904), *L'Eglise et la République* (1905), *Le livre de mon ami, le livre de Pierre* (1905), *L'Île des péguons* (1908), *Vie de Jeanne d'Arc* (1908), *Les dieux ont souff* (1912), and *La révolte des anges* (1914). Most of his works have been translated into English and German. Consult R Le Brun, *A France* (Paris, 1904), George Blandes, *Anatole France* (New York, 1908), P Stapfer, *Humour et humoristes* (Paris, 1911), C H Conrad Wright, *A History of French Literature* (New York, 1912).

FRANCE, INSTITUTE OF. See INSTITUTE OF FRANCE.

FRANCE, ISLE OF. See MAURITIUS.

FRANCE, JOSEPH (1787-1869). A French reformer, born in Lorraine. He entered the army in 1815, obtained a commission in the West Indies, and in Martinique rose to the rank of colonel in 1834. From 1836 to 1846 he had supreme command of the military police in the island and endeared himself to the lower classes of the population and to the slaves in particular. In 1841 he published *La vérité et les faits, ou l'esclavage à nu*, in which he set forth the cruelties of the colonists towards the negroes. The Governor, fearing the effects of this work, removed France from his command and sent him a prisoner to Paris to stand trial for publishing seditious writings. He lost his commission, but after the revolution of 1848 and the abolition of slavery in the colonies he was chosen to represent Martinique in the Constituent Assembly. From 1852 until his death he was a member of the colonial council of Martinique. Besides contributions to the *Revue Abolitioniste*, he published *Histoire de la Guadeloupe* (1885), *Les corsaires français dans les Antilles* (1857), *Histoire de la filibuste* (1860), *Questions coloniales* (1860), *Statistique physique et politique de la Martinique* (1861).

FRANCE, REFORMED CHURCH OF. See HUGUENOTS.

FRANCESCA, fran-chès/kà, PIERO DELLA (c 1420-92). A central Italian painter of the

Renaissance This form of the name, the traditional one, is most usual in contemporary documents and is to be preferred to Pietro de' Francesci, the form generally adopted by modern authorities (See Gionau, *Repertorium für Kunstwissenschaft*, xiii, 392-394) He was born at Borgo San Sepolero, the son of a notary of influential family His work shows the influence of Paolo Uccello (q.v.), and he was an assistant of Domenico Veneziano, probably at Perugia and certainly in 1439-40 in the frescoes in the chapels of Sant' Egidio and Santa Maria Nuova, Florence In 1451 he painted a fresco in the church of San Francesco at Rimini representing his patron, Sigismondo Malatesta, Lord of Rimini, kneeling before St Sigismond He was active at Ferrara and Bologna, and is said, upon an invitation to Rome by Nicholas V, to have painted two frescoes which were destroyed when Raphael painted the Stanze of the Vatican By 1466 he had finished his greatest work, the "Story of the True Cross"—a series of frescoes in the choir of San Francesco, Arezzo The "Story" begins with Adam, deals with Solomon and the Queen of Sheba, St Helena and Constantine, whose "Vision" is marvelously depicted, and Heracles and Chosroes In 1469 Piero was at Urbino in the house of Giovanni Santi (q.v.) At this time he painted for Duke Federico of Urbino the two remarkable portraits, now in the Uffizi, of the Duke and his wife Battista Sforza, with allegories on the reverse sides, the "Madonna" in the Biera; and the "Flagellation of Christ" in Urbino Cathedral According to a tradition preserved by Vasari, Piero became blind in his later life, which was probably devoted largely to his writings He was buried in the cathedral of San Sepolero in 1492 Other important frescoes by him are "St Louis of Toulouse" (1460) and the "Resurrection," in the town hall of Borgo San Sepolero, "Hercules," in the Gardner collection, Boston, and a "Magdalen" in the cathedral of Arezzo His other important panel pieces include a "Baptism of Christ" and "Nativity" with remarkable light effects, in the National Gallery, London, an "Annunciation," in the Gallery of Perugia, a "St Thomas Aquinas," in the Poldo Pezzoli collection, Milan, and an early "Triumph of Chivalry," in the Gallery of the New York Historical Society Piero was the greatest of the Realists of the fifteenth century, whose achievements made possible the brilliant later development His was especially the determinative influence in central Italian painting The equal of the best Florentines in draftsmanship, he was their superior in color, and he was the first Italian painter to master light and atmosphere His figures are well modeled—solemn and impassive in expression, and rendered with thorough objectivity He was also a theorist and scientist of note His treatise *De quinque Corporibus* shows him a learned geometrician, and his *Prospettiva pingendi*, a manual on perspective, is the most remarkable of its day His principal pupils were Melozzo da Forlì and Luca Signorelli (qq.v.). The most scholarly biography of Piero della Francesca is by Witting (Strassburg, 1898), others are by Ricci (Borgo San Sepolero, 1893), Waters (London, 1901), and Ricci (Rome, 1910)

FRANCESCA DA RIMINI, dā rē'mē-nē (?-c 1288). The daughter of Guido da Polenta, the Lord of Ravenna She was given by him in marriage to Giovanni, sometimes called Gianci-

otto, or Sciancato (the Lame), the son of Malatesta, the podestà of Rimini Malatesta was a Guelph leader who had made himself the master of all the region about Rimini He had, besides Giovanni, a son, Paolo, called the Handsome, whom Giovanni sent to Ravenna to bring back his bride Francesca and Paolo fell in love, and Giovanni, finding them together, killed them both (c 1288) The tale has many modifications, but this is the simplest outline of the story Aside from Dante's famous lines in the *Inferno* (v, 72-142), it has been treated repeatedly in literature and art The best known of the pictures are "Paolo and Francesca," by Ingres (1819), in the Chantilly Museum, Ary Scheffer (1835), in the Wallace collection, G F Watts (1879), and the "Death of Paolo and Francesca," by Cabanel (1870), in the Luxembourg Leigh Hunt made this story the subject of a poem (1816), Silvio Pellico wrote a tragedy on it (1818), G H Boker made an acting version (1864), Paul Heyse treated it dramatically (1850), Stephen Phillips produced a dramatic poem (1899), the Italian poet D'Annunzio a drama (1901), G Cesario, a tragedy (1906), and the Bohemian Nernda, a tragedy (1909) There is an opera of this name by Hermann Gotz (1877), which was completed by E Frank, a symphonic poem for orchestra by Tchaikowsky (1877), and an opera by Ambroise Thomas, *Françoise da Rimini* (1882) Consult Yriarte, *Françoise da Rimini, dans la légende et dans l'histoire* (Paris, 1882), Tornini, *Memorie storiche intorno a Francesco da Rimini* (Rimini, 1870), *De Sanctis in Nuova Antologia* (Florence, 1869), Ricci, *L'Ultimo rifugio di Dante* (Milan, 1891) For an exhaustive bibliography on the subject, consult Mazzolini, *Atte dell' Ateneo*, vol xvi (Bergamo, 1901)

FRANCESCHINI, fran'chēs-kē'nē, BALDASARE (1611-89). An Italian painter of the Florentine school He was born at Volterra, whence he is also called Volterrano Giunior, to distinguish him from Daniele da Volterra He was a pupil of Matteo Rosselli and Giovanni di San Giovanni in Florence and afterward studied the antique in Rome He was a very facile painter and possessed exceptional knowledge of foreshortening and perspective, but, like the rest of the Mannerist group, was deficient in technique and in sentiment His works are principally in Florence, where he painted four large paintings of the deeds of the Medici in the Ducal Palace, and frescoes in several churches, including Santa Maria Maggiore and Santissima Annunziata and at Volterra, especially in the convent of Santa Badia di San Giusto His masterpiece is the "Coronation of the Virgin," in Santissima Annunziata, Florence He is represented in the Pitti and Uffizi, in the Metropolitan Museum, New York, and in the Walters Gallery, Baltimore, by a "Madonna and Child"

FRANCESCHINI, fran'chēs-kē'nē, MARCANTONIO (1648-1729) An Italian painter, born at Bologna He studied under Galli and was the pupil and friend of Carlo Cignani and worked with him at Bologna, Modena, Reggio, and elsewhere One of his greatest paintings, a fresco at the Council Palace in Genoa, representing scenes from the history of the Republic, was destroyed Others of his large decorative works are frescoes in the Pallavicini and Durazzo palaces in Genoa, a ceiling in the Ranazzi Palace in Bologna, and the "Death of St. Joseph" and other paintings in the Corpus

Domini church, Bologna In 1711 he designed for Pope Clement XI several cartoons for mosaics in St Peter's, Rome, and he was also invited to Vienna, where he painted frescoes in the Lichtenstein Palace. Franceschini was in many ways a remarkable artist; he had a genius for composition, and all that was mannered and artificial in his imitators was redeemed in him by the fertility of his imagination and the warmth of his color. His easel pictures include "The Annunciation," Bologna Gallery, "Birth of Adonis" and "The Magdalen," Dresden Gallery, "San Carlo Borromeo Helping the Plague-Stricken" and "Charity," in the Vienna Gallery.

FRANCESCO, PIETRO DE See **FRANCESCO, PIERO DELLA**

FRANCESCO DI PAOLA, fran-chés'kò de pa'ò-la See **FRANCIS OF PAOLA**

FRANCHE-COMTÉ, fransh' kôn'tà' (Fr, free county) An old province in the east of France, in the basin of the Rhône, comprising what now forms practically the departments of Doubs, Haute-Saône, and Jura, and part of the Department of Ain. It was inhabited in ancient times by the Sequani and was the Maxima Sequanorum of the Romans. In the fifth century it was conquered by the Burgundians and later formed part of the Frankish monarchy. It passed afterward through various hands, until in 1156 it came into the possession of the Emperor Frederick Barbarossa. In 1384 it was annexed by Philip the Bold of Burgundy. Through the marriage of Mary of Burgundy to Maximilian, Franche-Comté became a possession of the Hapsburgs, and, together with the Netherlands, it passed to the Spanish branch of that house and was confirmed by the Peace of Westphalia (1648). The acquisition of the region was one of the chief objects of Louis XIV's external policy, his armies overran the province in 1668 and 1674, and he was confirmed in his conquest by the Treaty of Nimeguen (1678). The name first appears in the twelfth century, and indicates freedom from Imperial taxation, except the annual gift to the sovereign of a stipulated sum. Louis XIV did away with this custom, however. Among the famous sons of the Franche-Comté are Cuvier, Rouget de l'Isle, and Victor Hugo. Its old capital was Besançon.

Bibliography G. Prepape, *Histoire de la réunion de la Franche Comté à la France*, 1279-1678 (2 vols., Paris, 1881), P. Marechal, *La Révolution en Franche Comté* (ib., 1903), L. Leblond, *Philippe II et la Franche Comté* (ib., 1911), F. Boirey, *La Franche Comté en 1814* (ib., 1912).

FRANCHETTI, frân-kët'tè, **BARON ALBERTO** (1860-) An Italian operatic composer, born at Turin. He was a pupil of Nicolò Coccon and Fortunato Magi. Proceeding to Dresden, he studied under Draeseke, after which he entered the Munich Conservatory. He belongs to the new school of Italian composers and is regarded as one of its most successful exponents. His principal and most important opera was the four-act drama legend *Asraele*, produced in 1888. Other and scarcely less successful operas are *Christoforo Colombo* (1892), *Fior d'Alpe* (1894), *Il signor di Pourceaugnac* (1897), *Germania* (1902), *La figlia di Jorio* (1906). He also wrote many smaller works, the best of which is a symphony in E minor.

FRANCHEVILLE, fransh'vêl', or **FRANQUEVILLE**, frânk'vêl', **PIERRE** (1548-1618). A French sculptor, born at Cambrai.

Against his parents' wishes he went to Paris in 1564 to study art, and, recalled home to follow a literary career, left his country secretly, making his way to Germany and Austria. At Innsbruck, where he was apprenticed to a wood carver for five years, he found a patron in the Archduke Ferdinand, who enabled him to study under Giovanni da Bologna at Florence. He assisted that famous master in many of his works. In 1574 he modeled a number of statues for Villa Rovezzano, near Florence, and in 1585 he went to Genoa, where the colossal figures of Jupiter and Janus in the Grimaldi Palace, and the statues of St Ambrose, St Stephen, and "The Four Evangelists," in the cathedral, bear witness to his proficiency. The rapidly increasing reputation acquired by such works as the "Allegorical Figures of Humility, Chastity, and Wisdom," in the Nicolini Chapel at Florence, led to his being sent to Pisa to assist Giovanni da Bologna in modeling the doors of the cathedral, and afterward to his being summoned to Paris by Henry IV who appointed him court sculptor. In that capacity he executed numerous statues, busts, and vases for the royal palaces and gardens. Prominent among these are "David with the Head of Goliath" (1612), "The Conquered Nations" (1614), four figures, formerly part of the equestrian monument of Henry IV, and "Orpheus"—all in the Louvre, and the groups of "Time and Truth" and "Saturn and Cybele," in the Tuileries Garden. His work is somewhat cold and dry, but he was a man of great versatility and also active as an architect, painter, and writer.

FRANCHI, fran'kè, **AUSONIO** (1821-95). The pseudonym ("free Italian") of Cristoforo Bonavino, an Italian philosopher, born at Pegli, near Genoa. He was ordained a priest, but abandoned this career and gave himself to the study of philosophy, under the name of Franchi, by which he was always known. He became professor at the University of Padua in 1860 and at the Academy of Milan in 1863. Among his works are *La filosofia delle scuole italiane* (1852), *La religione del secolo XIX* (1853), *Del sentimento* (1854), *Il razionalismo del popolo* (1862), *Saggi di critica e polemica* (1871), *Lettere su la teoria del giudizio* (1870), *Ultima critica* (1890-93).

FRANCHI, FABIAN AND LOUIS DEI In Boucicault's drama *The Corsican Brothers*, the twin brothers whose mysterious sympathy is the basis of the play.

FRANCHISE, frân'chîz. In English law, as defined by Blackstone, a royal privilege, or branch of the crown's prerogative, subsisting in the hands of a subject. Being derived from the crown, franchises must arise from royal grant, or in some cases may be held by prescription, which presupposes a grant. The subjects of franchise correspond with what in Scotland are called regalia (qv). The right to take waifs, estrays, wrecks, treasure-trove, royal fish, and forfeitures, all of which are the prerogatives of the crown, are franchises. The rights of forest, chase, park, warren, and fishery are also franchises, no subject being entitled so to apply his property for his own convenience. A county palatine (see **PALATINATE**) is the highest species of franchise, as within it the earl, constable, or other chief officer may exercise without control the highest functions of the sovereign. And as the crown may thus erect an entire county into an independent jurisdiction, so it may

create a liberty of bailiwick independent of the sheriff of the county, and bestow the privilege as a franchise. It is likewise a franchise for a number of persons to be incorporated, and subsist as a body politic, with a power to maintain perpetual succession and do other corporate acts, and each individual member of such corporation is also said to have a franchise or freedom. The right to hold a fair or market, or to establish a ferry and to levy tolls thereon, is also a franchise. Where the holder of a franchise is disturbed in his right he may sue for damages by an action on the case, or in the case of non-payment of tolls he has the remedy of distress (qv). Viewed as property, a franchise is an incorporeal hereditament (qv). When a franchise is granted on a valuable consideration, as in the case of a private corporation, it is in the nature of a contract between the government and the grantee and is protected from legislative interference in this country by constitutional provisions prohibiting the enactment of laws which impair the obligation of contracts (See DARTMOUTH COLLEGE CASE). On the other hand, the franchise is affected with a *jus publicus*, which secures to the state the power of regulating the conduct of a corporation and even of destroying it as punishment for any grave abuse of its privileges. Serious problems have arisen in connection with the taxation of franchises, the question whether grants in perpetuity should be made, the effect of bribery in their procurement, and the extent to which there should be public ownership or control.

As a political term, franchise denotes the right of suffrage. In England the qualifications of voters for members of Parliament are quite different from those of voters at municipal and other local elections. In the United States the conditions of elective franchise are generally, though not always, the same for Federal, State, and municipal purposes. See SUFFRAGE, and consult Pollock and Matland, *History of English Law* (Boston, 1899), Kent, *Commentaries on American Law* (ib, 1896), Taylor, *Treatise on the Law of Private Corporations* (New York, 1902), Myers, *History of Public Franchises in New York City* (ib, 1900), Joyce, *Treatise on Franchises, especially those of Public Service Corporations* (ib, 1909), King, *The Regulation of Municipal Utilities* (ib, 1912).

FRANCIA, fran'cha (properly FRANCESCO RAIBOLINI) (1450-1518). An Italian painter and goldsmith of the early Renaissance, the chief master of the early Bolognese school of painting (qv). He was born at Bologna, the son of a carpenter, and until his fortieth year practiced the goldsmith trade. In this he achieved high distinction, having been repeatedly steward of the goldsmiths' guild and in 1514 steward of the Four Arts. He was famous as a medalist and as a worker in niello. Two charming niello plates at the Academy of Bologna are ascribed to him, as is also a small relief portrait of Giovanni II Bentivoglio in San Giacomo Maggiore. The ruling house of Bentivoglio named him master of the mint, and upon its expulsion Pope Julius II confirmed him in this office.

Francia's earliest dated paintings (1494) show the influence of Lorenzo Costa, who was then at Bologna, and who probably taught him painting. The metallic character of his first pictures and their strong outlines point to his former profession. But Francia soon outgrew

his colleague, both in color and in drawing, although Costa was more imaginative and dramatic. There also appears in his works a sentiment reminiscent of the Umbrian masters. Among his earlier paintings are a "Holy Family," in the Museum of Berlin, and a dead "St. Stephen," in the Borghese Palace, Rome. The Pinacoteca of Bologna has a fine "Madonna Enthroned," (1494), his earliest-dated work, and a "Dead Christ," the Brera (Milan), an "Annunciation" the Louvre, a "Crucifixion," originally in San Giobbe, Bologna, Berlin, a "Madonna and Six Saints" (1502). The "Virgin in a Rose Garden Adoring the Christ Child," in the Munich Gallery, a picture of highest poetic charm, is, without any doubt, his masterpiece. Another fine example of his work is the Bentivoglio altarpiece in San Giacomo Maggiore, Bologna.

The chief claim of Francia's paintings consists in a peaceful, lyric sentiment and in the dainty loveliness of the landscapes. This is especially true of his earlier works. They indeed lack composition—a defect remedied in his less attractive later works, painted under the influence of Raphael. The reputed correspondence between Francia and Raphael and Francia's sonnet to the master are forgeries of a later date, but Francia may well have seen works of Raphael at Bologna. Among the works showing the influence of Raphael are the "Virgin Enthroned," in the National Gallery, London, the "Coronation of the Virgin," in the cathedral of Ferrara, and the "Assumption of the Virgin," in San Frediando, Lucca. Other examples are the "Deposition from the Cross," in the Parma Gallery, the "Adoration of the Kings," at Dresden, and a "Madonna" in the Gardner collection, Boston, and a head of the "Virgin," in the Philadelphia Academy of Fine Arts. His frescoes in the Oratory of Santa Cecilia, Bologna, representing the "Marriage of the Saint with St. Valerian" and her "Burial," are among the finest of his works. He died at Bologna, Jan 5, 1518.

Francia's sons, GIACOMO (died 1557) and GIULIO (1487-1543), painted in their father's manner, but were much inferior to him. They worked together, signing their works J. J. Francia, and examples of their joint efforts exist in the galleries of Bologna, Parma, and Berlin. Giacomo, who was the better painter, subsequently came under the influence of Dosso Dossi (qv). Specimens of his independent work are in the Museum of Berlin, the churches and Gallery of Bologna, and in the Brera, Milan.

Consult. Cartwright, *Mantegna and Francia* (London, 1881), Morelli, *Italian Painters* (ib, 1892-93), and the monographs by Williamson (ib, 1901) and Lipparini (Bergamo, 1913), also Carmichael, *Francia's Masterpiece* (London, 1909).

FRANCIA, fran'sé-á, JOSÉ GASPÁR RODRÍGUEZ (c.1757-1840). Dictator of Paraguay. He was born at Asunción and was the son of a small landed proprietor of Portuguese origin. He studied theology at the University of Córdoba de Tucumán, taking the degree of D.D. Later he turned to law and gained considerable distinction as a jurist and public official, becoming popular because of his advocacy of the rights of the lower classes. Refusing to join Buenos Aires in the revolutionary movement, in 1811 Paraguay joined the Liberal cause and declared her own independence. Francia took

a leading part in the revolution and was made secretary of the government Junta. He was the one man of ability among an ignorant population and was so hampered by his colleagues that he resigned his position, only to come forward into still greater prominence when the incapacity of the governing body had precipitated a counterrevolution. In 1813 Francia and General Fulgencio Yegros, a man of little intellect and energy, were appointed consuls. The next year they were granted a temporary dictatorship of three years, but soon after Yegros was forced out by Francia. In 1816 Francia was made Dictator for life by Congress, which was immediately dissolved. For the next 25 years he was the sole ruler of Paraguay. Solitary and mysterious, his motives are little known, and he is usually considered as a bloody despotic tyrant, but his acts hardly indicate that he was moved solely by selfish interests and ambitions. He was the government, ruling in secret, yet under his sway the condition of Paraguay rapidly improved. The extraordinary system of nonintercourse with other nations which he enforced benefited Paraguay in diversifying her industries and forcing her farmers to develop the resources of the soil to the utmost in order to supply the home market. Francia introduced schools, repressed superstitious observances, and enforced strict justice in the courts, but he kept his subjects in a state of cruel bondage, being known to them as "El Supremo" (the supreme one), and living in perpetual fear of assassination. Rengger and Longchamp, two Swiss surgeons whom Francia held as prisoners from 1819 to 1825, gave an account of the Dictator in their *Essai historique sur la révolution de Paraguay et le gouvernement dictatorial du docteur Francia* (Paris, 1827). Consult Robertson *Letters on Paraguay* (London, 1838), *Francia's Reign of Terror* (ib., 1839), *Letters on South America* (ib., 1843).

FRANCIABIGIO, fran'cha-be'jo (an abbreviation of Francesco di Cristofano Bigi) (1482-1525). A Florentine painter, of the high Renaissance. He was a pupil of Piero di Cosimo and Albertinelli (qv), but was influenced to a far greater extent by Andrea del Sarto, with whom he lived and worked. Among the works of his early period, showing the influence of Albertinelli, are the "Annunciation," in the Turin Gallery, the "Virgin with Job and St. John" and "Calumny," after Lucian's description of a picture by Apelles, both in the Uffizi (Florence), the "Madonna del Pozzo," in the same gallery, usually ascribed to Raphael, has also been attributed to him. He assisted Andrea del Sarto in most of his frescoes. Among their joint works was a series representing the "Life of the Virgin," in the cloister of the convent of the Servites (Santissima Annunziata), Florence. One of this series, the "Marriage of the Virgin," is Franciabigio's best work, although mutilated by the artist himself, who was enraged at its premature unveiling by the friars. Of the series of frescoes of the "Life of John the Baptist," in the convent dello Scalzo, he executed two: "Departure of John for the Desert" and "Meeting of John and Jesus." He also painted a fresco of the "Last Supper" at La Calza, and the "Triumph of Cicero" at Poggio a Caino, near Florence. Among his other canvases are the "Temple of Hercules," in the Uffizi, and the "Story of Bathsheba" (1523), at Dresden. His paintings are fine in color and

excellently modeled, but he is at his best in his portraits of young men, which show marked individuality. There are fine specimens in the Pitti Palace and the Louvre, besides others in the Berlin Museum (1522) and the National Gallery, London, and one at Windsor Castle, which is usually ascribed to Andrea del Sarto.

FRANCILLON, fran'sé'yôn'. The title of a play by the younger Dumas.

FRANCILLON, fran'si-lon, ROBERT EDWARD (1841-) An English journalist and novelist. He was educated at Trinity Hall, Cambridge, and was admitted to the bar in 1864. From 1872 to 1894 he was on the staff of the *London Globe*. His first novel, *Grace Owen's Engagement*, appeared in *Blackwood's Magazine* in 1868. Among his many other books are *Olympia* (1874), *A Dog and his Shadow* (1876), and, between the last-named date and 1913, *King or Knave*, *Jack Doyle's Daughter*, *Ropes of Sand*, *Gods and Heroes*, and *Rose Maiden* (a cantata, music by F. H. Cowen, 1911).

FRANCIS I (1708-65). Holy Roman Emperor from 1745 to 1765. He was the son of Leopold, Duke of Lorraine, and in 1729 succeeded his father in the duchy. In 1735 he ceded Lorraine to Stanislaus Leszczyński, father-in-law of Louis XV, to revert after his death to the crown of France, obtaining in return the succession to the Grand Duchy of Tuscany, whose native rulers, the Medicean family, were almost extinct. In 1736 he married Maria Theresa of Austria, the only daughter and heiress of the Emperor Charles VI, and in the following year became Grand Duke of Tuscany. In 1740 Charles VI died, and Maria Theresa succeeded him as ruler of the Austrian possessions. She made her husband coregent with herself, but gave him little share in the administration. In the wars carried on against Frederick the Great, Francis took little personal share. In 1745 he was elected Holy Roman Emperor and was crowned at Frankfort, October 4. The famous Seven Years' War (1756-63) now broke out between Austria and Prussia, but the cares which it imposed fell mainly upon the great-hearted Maria Theresa, while Francis chiefly concerned himself with amassing a huge private fortune. He died Aug. 18, 1765, at Innsbruck. His son Joseph succeeded him in the Imperial dignity, but Maria Theresa retained in her hands the sovereignty of the Austrian dominions till her death (1780). Consult Seyffart, *Leben Franz I* (Nuremberg, 1766), Aineith, *Geschichte Maria Theresias* (Vienna, 1863-79), R. Waddington, "La Guerre de Sept Ans," in *Histoire diplomatique et militaire*, vols. I-IV (Paris, 1899-1907).

FRANCIS II (1768-1835). Holy Roman Emperor from 1792 to 1806, and ruler of the Austrian dominions from 1792 to 1835 (with the title of Emperor of Austria from 1804). He was the eldest son of the Emperor Leopold II and of Maria Louisa, daughter of Charles III, King of Spain, and was born at Florence, Feb. 12, 1768. In 1790 his father, previously Grand Duke of Tuscany, became Emperor on the death of his brother Joseph, and dying March 1, 1792, was succeeded in the hereditary Austrian dominions by Francis, who in July was elected to the Imperial throne of Germany. His reign began at a time when the progress of the French Revolution was exciting the alarm of the Old European dynasties. Austria was in alliance with Prussia against the Republic, and the allied

armies invaded France, but were driven back. In 1794 the French arms carried all before them in Belgium. In 1795-96 the war between France and Austria raged fiercely on German soil. In 1796 Bonaparte swept through northern Italy, and in 1797 Austria was invaded. Francis was forced to conclude the Treaty of Campo Formio Oct. 17, 1797, by which Austria surrendered Belgium and Lombardy, receiving in return most of the dominions of the extinguished Republic of Venice. Two years afterward Francis, in alliance with Russia and England, again took up arms and was at first successful, but the recall of the Russian general, Suvaroff, and the return of Bonaparte from the East turned the tide. The victories won by Bonaparte at Marengo and by Moreau at Hohenlinden broke the power of Austria, and Francis was compelled to sue for peace. By the Treaty of Lunéville in 1801 France was confirmed in the possession of the left bank of the Rhine. In 1804 Francis assumed the title of Emperor of Austria. In 1805 he entered into a new alliance with Russia, but the contest with France ended more disastrously than ever for the Austrians. The French victory at Austerlitz completely humiliated Francis, who, at the Peace of Pressburg, in December, 1805, was obliged to surrender the Venetian territories and Tirol. The Holy Roman Empire was now dissolved, after lasting for 1000 years, and Francis was henceforth known as Emperor of Austria and King of Bohemia and Hungary. In 1809 he recommenced the war with Napoleon. The battle of Aspern or Essling was an Austrian victory, though not a decisive one, but Napoleon triumphed again at Wagram, and dictated terms of peace from the palace of Schonbrunn in October of the same year, wresting from the Hapsburgs a large portion of their ancient hereditary territories. In 1810 the French Emperor married the daughter of Francis, Maria Louisa, and gained a respite. During this time he studied the situation of Europe and under the guidance of Metternich (qv) joined the Russians and Prussians against France in 1814. Immediately after the first abdication of Napoleon the Congress of Vienna was assembled for the reconstruction of the political system of Europe. (See AUSTRIA-HUNGARY.) Francis joined Alexander I of Russia and Frederick William III of Prussia in the formation of the Holy Alliance (qv), and the reactionary and absolutistic ideas embodied in that contract characterized the policy during the remainder of his reign. Francis died on March 2, 1835. Consult Baron J. A. Helfert, *Kaiser Franz und die österreichischen Befreiungskriege* (Vienna, 1867), and Meynert, *Franz I* (ib., 1871-73).

FRANCIS I (1494-1547). King of France (1515-47). He was the son of Charles, Count of Angoulême, and was born at Cognac, Sept. 12, 1494. At the age of 20 he married Claude, daughter of Louis XII, and succeeded his father-in-law Jan. 1, 1515. He immediately entered upon the task of reconquering Milan, which had been wrested from his predecessor two years before. At the head of 40,000 men Francis crossed the Alps and attacked the Swiss allies of the Milanese at Marignano, completely defeating them with a loss of 12,000 men, Sept. 13 and 14, 1515. On the field of battle Francis accepted knighthood from the renowned Bayard. After some further successes he returned to Paris in 1516. On the death of the German Em-

peror Maximilian in January, 1519, Francis I and Charles of Spain became rival candidates for the Imperial crown. The election of Charles excited the anger of the French King, who immediately prepared for war and endeavored to secure the alliance of Henry VIII of England, but with no success, Henry instead forming an alliance with the Pope and the Emperor against Francis. The forces of Francis I were driven out of Italy, the English and Imperialists invaded France, the Constable de Bourbon, who was discovered to be conspiring against his sovereign, fled to Charles, who gladly accepted his services. An attempted invasion of Italy by the French failed, and the Imperialists advanced into Provence. On the approach of the French King they withdrew into Italy, where they were followed by Francis, who overran Lombardy, but was totally defeated and taken prisoner at the battle of Pavia, Feb. 24, 1525. Charles carried his captive to Madrid and only granted him his liberty on the hardest conditions. He was forced to renounce the sovereignty of Flanders and Artois, the Duchy of Burgundy, and all his Italian possessions, to promise the restoration of the Constable de Bourbon to his former dignities, and to surrender his two sons as hostages. Francis obtained his freedom March 17, 1526, but his first act, on his return to his dominions, was a refusal to fulfill the pledges he had given. Pope Clement VII absolved him from his oath, England, Rome, Venice, Florence, and Genoa—all of whom were growing alarmed at the immense power of Charles—withdrew from the Imperial alliance and sided with his antagonist. The war in Italy now recommenced. On May 6, 1527, the Imperial forces of the Constable de Bourbon stormed and sacked Rome and captured the Pope. A French army under Lautrec was sent into Naples, but after a series of brilliant successes was almost wholly cut off by disease. About the same time Francis sent a challenge to Charles to decide their quarrel by single combat. The challenge was accepted, but the duel never took place. Peace was concluded at Cambrai in August, 1529, to the great advantage of the Spaniards. In 1536, however, war broke out again between the French and the Emperor, the French having overrun Savoy, to which Francis laid claim, and whose Duke was the ally of Charles V. Finally, by the efforts of Pope Paul III, a truce was concluded for 10 years at Nice, between Charles and Francis, June 18, 1538. In point of fact, however, peace lasted only four years, and in 1542 the French King put into the field five different armies against the Emperor. The battle of Ceresole, April 14, 1544, in which the French were completely victorious, partially wiped out the dishonor of the defeat at Pavia. Alliance with Turkey aroused the Christian powers. Charles V and Henry VII of England marched upon Paris, and Francis was compelled to make peace with the Emperor at Crespy, Sept. 18, 1544. The war with England continued till 1546. Francis died at Rambouillet, March 31, 1547. Gay and voluptuous, Francis was still capable of heroic impulses and acts of splendid generosity. He was a generous patron of the artists of the Renaissance, several of whom were to be found at the French court. Libraries, schools, and colleges were founded and learning encouraged.

FRANCIS II (1544-60) King of France from 1559 to 1560 He was the eldest son of Henry II and Catharine de' Medici and ascended the throne in his sixteenth year Weak in mind and body, he was merely a tool in the hands of the Duke of Guise and the Cardinal of Lorraine, whose ambition brought on disastrous civil wars. He married (1558) the famous Mary Stuart. Consult De la Barre-Duparcq, *Histoire de François II* (Paris, 1867), Ernest Laisse, *Histoire de France*, vol vi by J H Mariéjol (ib, 1904), which contains a bibliography

FRANCIS IV, DUKE OF MODENA (1770-1848) An Italian despot After the fall of Napoleon in 1814 he received the Duchy of Modena, which he governed thereafter in the harshest and most reactionary manner He instituted proceedings against all those suspected of the least taint of liberalism, filled Modena with spies, hindered education, and stifled all popular liberties Several of the Modenese Liberals, including Ciro Menotti (1798-1831), he caused to be executed, while hundreds of others were imprisoned or forced to flee the country Revolts broke out in 1831, but with the aid of Austrian troops he maintained his power and continued his persecutions and oppressions until his death

FRANCIS V, DUKE OF MODENA (1819-75). An Italian despot He continued the tyrannies of his father, Francis IV. His rule began with uprisings in various quarters of his realm, especially at Massa and Carrara, where his troops massacred some of the inhabitants Forced to flee to Mantua during the revolution of 1848, he returned after the defeat of the Piedmontese, with Austrian assistance He suppressed all disturbances most rigorously and filled the prisons with political offenders After the defeat of the Austrians at Magenta he led his army against the victorious Piedmontese, but from 1860 to the end of his life he spent in retirement in Austria. Consult Bayard de Volo, *Vita di Francesco V* (4 vols, Modena, 1878-85)

FRANCIS I (1777-1830). King of the Two Sicilies from 1825 to 1830. He was the son of Ferdinand I In 1812 he was appointed Regent of Sicily by his father and proclaimed a constitutional government, but in the following year his father deposed him and dissolved the Parliament In 1816 Francis became Governor of Sicily and in 1820 Regent of Naples In 1825, on the death of his father, he ascended the throne He became at once a reactionary, and his reign was marked by corruption, cruelty, and subservency to Austria Consult Nisco, *II*

Reame di Napoli sotto Francesco I (Naples, 1893)

FRANCIS II (1836-94) King of the Two Sicilies from 1859 to 1861 He was the son of Ferdinand II and followed his father's system in ruling with an iron hand He refused all liberal concessions in spite of the urgent demands of the Powers When Sicily, with the exception of Messina, had submitted to Garibaldi in the summer of 1860, he sought to pacify his people by the promise of manifold reforms and, failing to secure their good will, made strong but unsuccessful efforts to secure foreign intervention in his behalf After Garibaldi's entrance into Naples, September, 1860, the King fled to Capua and thence to the citadel at Gaeta After a short siege Gaeta surrendered, and the King took refuge on a French frigate Feb 13, 1861 His dominions were incorporated in the Kingdom of Italy, and he selected Rome as his place of residence Consult Nisco, *Francesco II, re* (Naples, 1891), and H R Whitehouse, *Collapse of the Kingdom of Naples* (New York, 1899) See GARIBALDI, ITALY

FRANCIS, CONVERS (1795-1863) An American Unitarian clergyman and writer He was born at West Cambridge, Mass, graduated at Harvard in 1815, and became a Unitarian minister at Watertown Lydia Maria Child, the philanthropist, was his sister Dr Francis became professor of pulpit eloquence at Harvard in 1842 He wrote a *History of Watertown* (1830), *Life of Rev John Eliot, the Apostle to the Indians* (1836), for Sparks's "Library of American Biography," and a *Life of Sebastian Rale* (1848), the Jesuit missionary Consult Newell, "Memoir of Convers Francis," in *Massachusetts Historical Society's Proceedings*, 1864-65

FRANCIS, DAVID ROWLAND (1850-1927) An American merchant and Democratic politician, born in Richmond, Ky He graduated at Washington University, St Louis, in 1870, and became a clerk in a commission house, rising to a partnership In 1877 he founded the commission and grain firm of which he remained the head He was Democratic mayor of St Louis in 1885-89 and Governor of Missouri in 1889-93 In President Cleveland's second administration he was Secretary of the Interior (1896-97) He was president and special foreign representative of the Louisiana Purchase Exposition held at St Louis in 1904 In 1910 he was an unsuccessful candidate in the primaries for United States Senator

FRANCIS, JAMES BICHENO (1815-92) An American hydraulic engineer, who has been called "the father of modern hydraulic engineering" on account of his practical and experimental work for over half a century on the water-power developments which created the city of Lowell, Mass He was born at Southleigh, England, and began his engineering career at the age of 14 years, on harbor work for a railway of which his father was superintendent Two years later he was employed on the Grand Western Canal in England In 1833 he came to America and soon began work on the Boston and Providence Railroad, under an engineer named George W Whistler The next year Mr Whistler began the water-power developments at Lowell, with Francis as assistant On Mr Whistler's resignation, in 1837, Francis, then only 22 years old, became chief engineer for the proprietors of locks and canals on the Merrimac River From 1845 to 1884 he was both agent and chief en-

gineer, and from 1884 until his death he was consulting engineer to the company. Besides building a great system of dams, canals, conduits, and water-power machinery, Francis did a vast amount of pioneer experimental hydraulic work, known the world over as the "Lowell hydraulic experiments." The results of these experiments were first published in 1855. They were republished, with new data, in 1868 and again in 1883. Of the various elements composing the water-power works built at Lowell under Francis, mention may be made of the Northern Canal, built in 1846-48. Besides his one great life work, Francis had a considerable consulting practice in the construction of dams, power plants, mill buildings, and in the application of power in mills. He was elected a member of the American Society of Civil Engineers on its organization in 1852, president in 1881, and an honorary member in 1892, a few months before his death. He contributed largely to the *Transactions* of that Society and to technical journals and wrote *The Strength of Cast Iron Columns* (1865), but his great work is the *Lowell Hydraulic Experiments* (3d ed., 1883).

FRANCIS, JOHN WAKEFIELD (1789-1861). An American physician of German and Swiss descent, born in New York. He was graduated from Columbia College in 1809 and received the degree of M.D. from the College of Physicians and Surgeons, New York City, in 1811. He was professor of *materia medica* in the College of Physicians and Surgeons from 1813 to 1816, professor of the institutes of medicine from 1816 to 1820, professor of obstetrics from 1820 to 1826, and professor of obstetrics and of medical jurisprudence in Rutgers Medical College, New York City, from 1826 to 1830. He interested himself greatly in the Woman's Hospital, the State Inebriate Asylum, and kindred institutions. With Dr. David Hosack he published the *American Medical and Philosophical Register* (1810-14). Among his many works were *Use of Mercury* (1811), *Cases of Morbid Anatomy* (1814), *Febrile Contagion* (1816), *On Cholera Asphyxia* (1832), *Anatomy of Drunkenness* (1857), *Memoir of Christopher Colles*, *Old New York, or Reminiscences of the Past Sixty Years*, with a memoir of the author by H. T. Tuckerman (1865).

FRANCIS, SIR PHILIP (1740-1818). An English epistolary writer, the reputed author of the *Letters of Junius*. The son of the Rev. Philip Francis, he was born in Dublin and was educated at St. Paul's School, London. In 1756 he obtained a place in the office of Henry Fox, then Secretary of State. In 1758 he became secretary to General Bligh, whom he accompanied on the expedition against Cherbourg, in 1760 secretary to the Earl of Linnoull, Ambassador to Portugal, in 1761 ambassador to Pitt, and in 1762 first clerk in the War Office. In 1773 he was appointed a member of the Council of Bengal, with a salary of £10,000, and sailed for India the next year. He quarreled with Warren Hastings, by whom he was severely wounded in a duel. Returning to England in 1781, he entered Parliament three years later and took an active part in the impeachment of Hastings. In his political opinions he was a decided and consistent Whig. He withdrew from Parliament in 1807. None of his known writings are of value. There is considerable evidence indicating that he was the author of the

Letters of Junius (qv). Consult Parkes and Meivale, *Memoirs of Sir Philip Francis* (London, 1867), *The Francis Letters* (2 vols., 1b, 1901), ed. by Beata Francis and Eliza Keary († B. Malleon *Life of Warren Hastings* (1b, 1894), and Sir Leslie Stephen's excellent article on Francis in the twentieth volume of the *Dictionary of National Biography* (1b, 1889).

FRANCISCANS, ORDER OF (also called MINORITES, or LESSER BRETHREN). A religious order of the Catholic church, founded by St. Francis of Assisi in 1209. It comprises the communities of men or women observing the rule of St. Francis in some of its various forms. They make up three divisions: the first order, the Friars Minor, includes the male members, the second, those monasteries of cloistered nuns professing the rule of St. Clare, and called the Poor Ladies, or Poor Clares, the third order, the Brothers and Sisters of Penance, both lay persons and certain religious congregations affiliated with the Franciscans. (See TERTIARY.) The Friars Minor, or first order, now has three divisions: the Friars Minor, or parent body, founded in 1209, the Friars Minor Conventuals, and the Friars Minor Capuchins, which have grown out of it and were established as independent orders in 1517 and 1528 respectively. (For an account of the establishment of the order and its earliest years, see FRANCIS OF ASSISI, SAINT.) The rule for the Friars Minor, drawn up by St. Francis in 1209, was divided into 23 chapters, containing 27 precepts, binding the members to "observe the holy Gospel of our Lord Jesus Christ by living in obedience, without property and in chastity." The use of money is absolutely forbidden, and the quantity, quality, and value of clothing are prescribed. The habit was to consist of a gray gown of coarse cloth, with a pointed head, or capuche, an undertunic and drawers, and a cord around the waist. This costume resembled the dress of the shepherds of the day. The use of shoes and riding on horseback were prohibited. Unnecessary conversations with women and the visiting of female monasteries without special dispensation were forbidden. Fasts on all Fridays of the year were enjoined, as also during the periods from All-Saints to Christmas and from Epiphany to Easter. The recitation of the Divine Office was also rendered obligatory. Absolute obedience to superiors in all things not contrary to the rule was prescribed. The order grew rapidly and spread throughout the various countries of Europe, until at the second general chapter, held at Assisi in 1219, within 10 years of its birth, more than 5000 brethren were present. In less than half a century it reckoned some 33 provinces, in which there were over 8000 convents, with a membership of 200,000. Some idea of the extraordinary extension of this remarkable institute may be formed from the startling fact that, in the dreadful plague of the black death in the following century, no fewer than 124,000 Franciscans fell victims to their zeal for the care of the sick and for the spiritual ministrations to the dying. After the death of St. Francis a modification of the rule was introduced by Brother Elias, his successor in the office of general of the order. This innovation related to the interpretation of the nature and extent of the vow of religious poverty, whether the community could acquire the privilege of the right of property even in things of necessary use. Those who adhered to the letter

of the rule denied the privilege of all right of property to the community, and contended that it was unlawful for the order to acquire or retain a right of property in houses, convents, or even churches restricting its right in everything which it possessed to the simple use. Out of this controversy arose divisions and subdivisions in the order. The first broad distinction to which it gave rise was that between the Conventuals and the Observantines, the former living according to a mitigated interpretation of the rule and holding to the community's right of property, while they strictly adhered to the vow of poverty on the part of the individual, the Observantines, following the more rigid interpretation of the rule, deny the right of property in the order and live more in the manner of hermits, in low, mean dwellings, and according to the original rigor of the institute. The latter were called Friars Minor of the Strict Observance. In the course of time there arose among the Observantines themselves several reform movements, which gave rise to three branches: that of St Bernardino of Siena in 1419, called the Reformed, then that of Blessed John de la Puebla and Blessed John of Guadalupe, under the name of Recollets in 1500, and, finally, the reform of St Peter of Alcantara in 1555, known under the name of Alcantarines.

By a bull of Leo XIII, Oct 4, 1897, all these, however, were united under one head, a minister general, elected by the provincial ministers at a general chapter held every 12 years. Several popes attempted to reconcile the differences between the Conventuals and the Observantines without avail. Finally, in 1517, Leo X officially recognized the distinction between them, and in a bull promulgated that year gave the name of Conventuals to those who persisted in following the mitigated rule and in holding to the community's right of property. Each body had its own general, but the minister general of the Observantines enjoyed preeminence and authority over the general of the Conventuals, who was obliged to obtain his confirmation from the former. During the pontificate of Sixtus V the Conventuals sought in vain to free their head from this subordination and renewed the attempt in 1594 under Clement VIII with no greater success. When they renewed their claim again under Urban VIII, the latter imposed silence upon them by a brief of April 21, 1631. In 1525 the reform among the Observantines that led to the establishment of the third branch, the Capuchins, was begun by Matteo di Bassi. An immense number of persons desirous of practicing in the world the virtues of the cloister joined the third order, from the humblest to the highest station in life, notably among the latter in the thirteenth century were St Louis of France and St Elizabeth of Hungary. In the course of time some tertiaries desirous of living in community, while conforming to the rules of the third order, formed communities in many parts of Europe which were affiliated with the general body as a branch distinct from the first and second orders.

The head of the entire Franciscan body was to be chosen alternately (a regulation, however, which has not been observed) from the Cismon-tane and the Ultramontane families—a geographical division, the latter being those religious whose convents are situated in France, Spain, Lower Germany, Saxony, the islands of the Medi-

terranean, Africa, Asia, and the Indies in general, the former those in Italy, Upper Germany, Hungary, Poland, Syria, and Palestine. Each family is again divided into provinces, by vicariates, or custodies. Several custodies constitute a province under a common superior appointed by the general. Some custodies are subject to a provincial, while others depend immediately upon the general. The superior of the order has under his jurisdiction the Poor Clares and other Franciscan nuns. The Poor Clares were founded by St Clare, the disciple and counselor of St Francis in 1212. A division over the strict observance of the rule of poverty established the Urbanist branch, who follow the less stringent rule allowed them by Pope Urban IV, Oct 18, 1263.

The whole Franciscan Order (male) is divided into 12 circumscriptions, formed by 81 provinces, made up of 1413 convents and 17,000 friars. The Poor Clares have 505 convents and 10,600 nuns. The third order (secular) is spread all over the world and has a membership of about 2,500,000. The sisters (religious) professing the rule of the third order number about 50,000. The general of the Conventuals is called Master General of the Friars Minor Conventuals, the general of the Capuchins, Minister General of the Friars Minor Capuchins. The third order has also a general of its own. The order has given five popes to the church: Nicholas IV, Alexander V, Sixtus II, Sixtus V, and Clement XIV, besides 54 cardinals, beginning with St Bonaventure. It has given some celebrated theologians and philosophers to the ranks of the schoolmen: St Bonaventure, Duns Scotus, Alexander of Hales, William of Occam, Roger Bacon, famous as the experimental philosopher of the Middle Ages, was a Franciscan Friar. The great Spanish statesman Cardinal Ximenes, two centuries later, was also a follower of St Francis. Its historian, Father Luke Wadding, who published his elaborate *Annals* of the order in the seventeenth century, bears a deservedly high reputation. In lighter literature, and especially poetry, St Francis himself is notable as a sacred poet. Jacopone da Todi, the author of the "Stabat Mater," is one of the most celebrated mediæval hymn writers, Lope de Vega, the Spanish dramatist, closed his eventful career as a member of the third order. Dante, it is believed from a passage in the *Divina Commedia*, was a Franciscan tertiary. In the revival of art the Franciscan Order bore an active and enlightened part. They may be said to have been the inspiring influence which gave rise in painting to the mystical school of Umbria, which in Perugino and Raphael attained the ultimate reach of Christian art. Giotto and his successors, especially in fresco painting, were profoundly influenced by the Franciscan spirit. In architecture the same spirit was potent in creating new types of churches in line with Cistercian models. The Franciscans may be said to have imported into art a sentiment which before then had existed only in a crude state—seraphic love. Their idealism and religious fervor did more perhaps than any other factor to exalt and spiritualize the art of the Middle Ages up to the time of the Renaissance.

FRANCIS DE SALES, *Fr. pron fran'sis'* de sal, SAINT (1567-1622). A distinguished saint and writer of the Catholic church. He was of noble descent and was born at the Château de Sales, the seat of his family in Savoy. He was the eldest son, and his father bestowed unusual care upon his education with the idea of fitting him for a worldly career in keeping with his station in life. After spending his earlier years at the Collège de la Roche and the Collège d'Annecy, in the neighborhood of his home, he became a pupil, at 13 years of age, of the Collège Clermont at Paris under the direction of the Jesuit Fathers. In 1584 he entered the University of Padua, where, at 24, he took his final degree with great distinction and became a Doctor of Laws. But his inclination was for the church rather than for law. His father at first opposed his wish to enter the priesthood, but in the end gave his consent. Upon his ordination he was appointed provost of the diocesan chapter at the request of Monseigneur de Granier, Bishop of Geneva. In 1594 the young priest was sent to the difficult mission of the Chablais, a province of Savoy, which had become Calvinistic. His efforts for a long time proved fruitless, but in time he saw his labors repaid with numerous conversions, before his departure witnessing the restitution of all churches and of all ecclesiastical property in the Chablais to the diocesan clergy. The government buttressed his efforts with law repressing Protestantism. Shortly after his return from the Chablais, at the solicitation of Monseigneur de Granier, Francis was made Coadjutor Bishop with the right of succession to the see of Geneva, and the succession followed in 1602. In that year the interests of the French division of the Geneva diocese took Francis to Paris. Here Henry IV conceived a cordial liking for him. As Bishop of Geneva, Francis was as indefatigable in his apostolic labors as when he was a simple priest. His preaching was simple, fervid, and direct. He carefully avoided the turgid ornament and rhetorical affectations common to the sermons of his century. As a writer, St Francis de Sales has attained a wide popularity. His *Introduction to the Devout Life* has been translated into almost every language of Europe and has been more widely read than any other work on devotion

with the exception of the *Imitation of Christ*. His *Treatise on the Love of God* is his chief doctrinal work and shows more fully the comprehensive character of his mind. His style is simple, lucid, and profusely illustrated. It was under the spiritual direction of St Francis de Sales that Ste Jeanne de Chantal (see CHANTAL, JEANNE FRANÇOISE DE) founded the Congregation of the Visitation of the Virgin Mary in 1610. St Francis died at Lyons, on Sept 28, 1622. In 1665 he was solemnly canonized by Pope Alexander VII, and in 1877 he was declared one of the doctors of the church. His works were published in Paris, 1861-62, and in more complete form, edited by Mackey, at Annecy, 1892. *The Love of God* has been edited by Stowsky (Paris, 1901, Eng trans., London, 1902), *The Canticle of Canticles* (New York, 1912), *Introduction to the Devout Life* (ib., 1913). For his life, consult C A de Sales (Chambéry, 1860), Camus, *The Spirit of Saint Francis de Sales* (New York, 1910), Lear, *Life* (London, 1882), also Guillot, *Francis de Sales et les protestants* (Geneva, 1873), Maxwell-Scott, *Saint Francis de Sales and his Friends* (St Louis, 1913).

FRANCIS FERDINAND (1863-1914). Archduke of Austria-Este, the son of Archduke Charles Louis (1833-96), brother of the Emperor Francis Joseph. He was born at Graz. In 1875, on the extinction of the male line of Modena, he succeeded to the wealth of the family and to the title of Este. The death of the Crown Prince Rudolph (1889) and of his own father made him heir apparent to the crowns of Austria and Hungary. In 1900 he married the Countess Chotek, created Princess Hohenberg, after renouncing for her children the right of succession to the throne. The Archduke wrote (1895-96) a description of his trip around the world in 1892-93. On June 28, 1914, he was assassinated with his wife at Sarajevo, Bosnia, as the result of a political plot—the culmination of discontent because of the absorption of Bosnia into the Austro-Hungarian Empire. Riots followed the crime, and the Imperial and general European *status quo* was seriously endangered. See WAR IN EUROPE.

FRANCIS JOSEPH I (1830-1916). Emperor of Austria. He was born Aug 18, 1830, at Vienna, the eldest son of Archduke Francis and a nephew of Ferdinand I Emperor from 1835 to 1848. Francis was taught the various languages of the heterogeneous Austrian monarchy. In 1848 he served under Radetzky in Italy. On Dec 2, 1848, amid the convulsions which threatened the dissolution of the Empire, the weak Emperor Ferdinand abdicated, his brother, the Archduke Francis, gave up his claims to the crown, and Francis Joseph, whose youth and popularity it was believed would make it easier to harmonize the conflicting interests of the monarchy, mounted the Austrian throne. Hungary was now in a state of open revolt, and in April, 1849, declared itself a republic with Kossuth as Governor. In Italy Charles Albert of Sardinia again took up arms against Austria. Both in Hungary and Italy Austria triumphed, and the Emperor devoted himself to the reestablishment of his authority (See AUSTRIA-HUNGARY). In 1853 an attempt on his life was made by an Hungarian, but the Emperor escaped with a slight wound. In 1855 a concordat was concluded with Pius IX, which restored to the Roman Catholic church through-

out the Empire many of the liberties of which it had been deprived since the hostile reign of the Emperor Joseph II. In 1859 Francis Joseph was called to face a war with France and Sardinia, which ended with the loss of Lombardy. After this war Francis Joseph abandoned his conservative policy and began the necessary work of reform, and after the disastrous Seven Weeks' War (qv) with Prussia, a reconstruction of the monarchy on a dualistic basis was effected by the *Ausgleich* of 1867. The abrogation in 1870 of the Concordat of 1855 antagonized the Pope. Francis Joseph always strove to maintain a constitutional and parliamentary régime in his dominions. He won the respect and affection of his subjects, and it was his personal influence that really held his dominions together under the most discouraging political conditions. Francis Joseph married, April 24, 1854, Elizabeth, daughter of Duke Maximilian of Bavaria, who was assassinated by an Italian anarchist in Geneva, Sept. 10, 1898. This marriage, the culmination of a genuine romance, ended in estrangement. Elizabeth consented to appear on great ceremonial occasions, but she found relief, when the functions were over, in travel. Her manner of life became that of a woman to whom life had nothing left except what converse with nature could afford. The only son of Francis Joseph and Elizabeth, Rudolph, died mysteriously by violence in his hunting box at Merveldt. The heir presumptive, Francis Ferdinand (qv), nephew of the Emperor, was assassinated with his wife June 28, 1914, at Serajevo, Bosnia. This caused the rupture between Serbia and Austria-Hungary which precipitated the great European war of 1914. (See WAR IN EUROPE.) The new heir, Charles Francis Joseph, nephew of the slain Archduke and son of the late Archduke Otto, was born in 1887.

When Francis Joseph came to the throne, Austria was a Teutonic power. To-day it has only a small Teutonic nucleus associated with a Magyar nucleus nearly as large, trying with it to assert predominant partnership in a large community of Slavs, and casting envious but not hopeful eyes towards the Balkan States and Aegean harbors. Francis Joseph, the mainstay of the Triple Alliance (Austria-Hungary, Germany, and Italy), came to be regarded as the one indispensable man in the Empire, the one whose life must be prolonged at all hazards, lest his death cause the collapse of the structure he reared. This feeling was intensified by the death of the Archduke Ferdinand.

During the 60-year jubilee in 1908 an Imperial rescript annexing Bosnia and Herzegovina was issued, but even this act of aggrandizement did not diminish the enthusiasm of the people for Francis Joseph. See AUSTRIA-HUNGARY.

FRANCIS OF ASSISI, *as-so'ze*, SAINT (1181 or 1182-1226). The founder of the Order of the Friars Minor, or Franciscans. He was born in the little town of Assisi, Italy. His father was a rich merchant, named Pietro Bernardone, his mother, Pica, of the noble family of the Bourlemonts of Provence, a woman of piety and character. The child's baptismal name was Giovanni (John), but his father, out of his predilection for France, with which he carried on an extensive trade, gave the boy the surname of Francesco (the Frenchman). Francis was taken into business partnership at the age of 14 by his father. In his twenty-fourth year, after much meditation on the course of life he had been leading, he suddenly abandoned his old friends and haunts and embraced a life of rigid penance and utter poverty. His object was to lead a life as nearly modeled upon that of Christ as possible and by absolute renunciation of the world to attain perfection. Retiring to a grotto near Assisi, he gave himself up to penance and profound meditation on the sufferings of Christ. In 1208, while hearing mass, he felt himself to be personally called to a mission and to poverty and went out to preach. His austerities and his simple eloquence attracted attention, and it was not long before others, awakened by his ardent example, sought to follow in his steps and join themselves to him in his austere mode of life. His first companions were fellow townsmen—Bernard of Quintavalle, a rich and noble layman, and Peter of Catana, a canon of the cathedral. Here was the nucleus of the Franciscan Order. It was not the intention of St. Francis in the beginning to found a new order. But others associating themselves with the three companions, until there were 12 all told in the band, St. Francis drew up a rule of life in 23 chapters, which, besides the three ordinary vows, of poverty, obedience, and chastity, prescribed the express and absolute renunciation of every possession and the engagement to live upon alms. As soon as the rule was drawn up (probably towards the close of June, or early in July, 1209), all betook themselves to Rome to seek the approval of the Pope. Innocent III, then Pope, after some hesitation, approved the rule by word of mouth, made Francis superior-general of the Friars Minor, and conferred the diaconate on the founder, for Francis was as yet only a layman, and always, from motives of humility, refused to become a priest. On their return to Assisi the Friars Minor established themselves in a little house adjoining the chapel of St. Mary of the Angels, where he had received the great message at mass. During the following two years the brethren occupied themselves with preaching and exhorting the people throughout the rural district around Assisi. The order now grew rapidly, and in 1216 was solemnly approved by Innocent III. Francis now sent missionary bands into the different provinces of Italy, then into France, Spain, and even Africa, to preach to the Moors. He himself set the example of the missionary work of the order by going into the East. Two years before his death St. Francis, while in an ecstasy of prayer, is said to have received the marks (stigmata) of the wounds of Jesus upon his own person. (See STIGMATIZATION.) The scene of this event is laid on Monte Alverno, a lonely mountain near Assisi, and the date Sept. 14, 1224. St. Francis died at Assisi, Oct. 3, 1226. He was canonized by Pope Gregory IX in 1228.

The works of St Francis have been frequently printed, by Horoy (Paris, 1880), in Latin, better by B da Fivizzano (Florence, 1880), Latin with Italian translation Consult the biographies written by Le Monnier (Paris, 1889, Eng trans, 1894), Paul Sabatier (ib, 1894, Eng trans by Houghton, New York, 1894), Knox-Little (London, 1897), Oesterly (ib, 1901), Adderley (ib, 1901), Stoddart (ib, 1903), Cuthbert (New York, 1912), Egan (ib, 1912), Jøisengen (ib, 1912) Consult also Brother Leo of Assisi, *Saint Francis of Assisi, the Mirror of Perfection*, ed by Paul Sabatier, trans by Sebastian Evans (London, 1899), Duff Gordon, *The Story of Assisi* (ib, 1901), *Acta Beati Francisci et Sociorum Ejus* (St Louis, 1902), ed by Sabatier, Barine, *S François d'Assise et la légende de ses trois compagnons* (Paris, 1901), Carmichael, *The Lady of Poverty A Thirteenth Century Allegory* (New York, 1902) A bibliography is given in Robinson's *A Short Introduction to Franciscan Literature* (ib, 1907)

FRANCIS OF PAOLA, pa'-o-la, or **PAULA**, SAINT (1416-1507) Founder of the Order of Minimites He was born at Paola in Calabria At an early age he gave himself to a hermit's life, following the example of St Francis of Assisi, having no bed but bare rocks, and no other food than the herbs which he gathered in the neighboring woods or which were brought to him by his friends He was joined by some other enthusiasts, and the building of a chapel in 1436 is generally considered as marking the beginning of the Minimite Order (See MINIMITES) In 1474 the order was definitely confirmed by the Pope, and Francis appointed its first superior During the following years several new convents were founded in Calabria and Sicily, and the fame of Francis for sanctity and miraculous powers increased daily When Louis XI of France was alarmed by the approach of death, he sent to beg the intercession of Francis, who was unwilling to go to France until he was commanded by Sixtus IV He visited the King at Plessis-les-Tours and prepared him for death, holding him in his arms when it came Louis's son, Charles VIII, also had a great respect for him and built him a cloister in the park of Plessis and another at Ambrose He completed his rule in 1493, in three parts, for the brothers, sisters, and tertiaryaries He died at the convent of Plessis in 1507 and was canonized by Leo X in 1519 Consult his life by Ralland (Paris, 1874), and Ferraute (Monza, 1881).

FRANCIS XAVIER, zăv'y-ēr, SAINT (1506-52) A celebrated Jesuit missionary, called, from the scene of his mission labors, "the Apostle of the Indies" He was the youngest son of one of the most distinguished families of Navarre and was born near Pamplona in that kingdom, April 7, 1506 His early education was received at home, and in 1524 he was sent to the College of Saint-Barbe, in Paris, where he pursued studies in philosophy with so much distinction that at the age of 24 he became a lecturer in philosophy in the Collège Beauvais, at that time one of the most important in the university He attracted the attention of Ignatius Loyola, then an obscure student at the university, but already taken with the prospect of founding the Society of Jesus. Ignatius, on the lookout for suitable associates, became a close friend of Xavier's. The young pro-

fessor's mind was intent on university distinction, but, realizing the vanity of his ambitions, he became one of the first members of the order that his Spanish compatriot was about to found (1534) He soon went to Rome in the interest of the new society During Xavier's stay in Rome John III of Portugal, anxious to extend the influence of Christianity to his immense Indian possessions, made a formal demand of the Pope for missionaries and asked especially for members of the new order Ignatius selected Bobadilla, but illness prevented his setting out, so Xavier was substituted for him, and after a single day for preparation began his journey to Lisbon At Lisbon, during the preparations for the voyage, he accomplished so much good that the King wanted to retain him at his capital But Xavier's heart was now bound up in the mission to India, and he sailed from Lisbon, April 7, 1541 He wintered at Mozambique and did not arrive in Goa until May 6, 1542

He found the lives of the European Christians in India so scandalous that it was useless to preach to the natives with such a perverse example under their eyes Accordingly he first took up the reformation of the foreign townspeople, and succeeded in awakening a spirit of exemplary penance and religious fervor Then he began his labors among the natives by preaching among the pearl-fishing population of the coast from Comorin to the island of Manar and on the coast of Ceylon After a little more than a year he returned to Goa, whence, with a fresh staff of assistants, he visited the Kingdom of Travancore. In the space of a single month here he baptized 10,000 natives Thence he passed to Malacca, where three other Jesuit missionaries, sent by Ignatius in compliance with Xavier's earnest solicitations, joined him His success among the dwellers on the coast region proved so encouraging that in 1546 he proceeded to the Banda Islands, to Amboyna, and the Moluccas Having effected an establishment of the gospel in many places, he now retraced his steps and revisited the scenes of his missionary labors At Malacca he met a Japanese, from whom he obtained information which filled him with desire for work in that country

After this he crossed to the island of Ceylon, where he converted the King of Kandy, with many of his people In May, 1548, he returned to Goa, to prepare for the conversion of the Japanese Empire A distinguished Japanese convert became a valuable auxiliary, and by his aid Xavier was enabled to acquire enough of the Japanese language to translate and explain the Apostles' Creed in it His first success was insignificant, but before long the usual blessing attended his labors. The mission founded by him at Miako continued to flourish for more than 100 years, until the final expulsion of Christianity from the Japanese Empire After two years and a half in Japan he resolved to organize a mission to China At Malacca he tried to arrange with the Governor that an embassy should be sent in the name of the King of Portugal to China, by the help of which he hoped to gain an entrance for his mission He was not able to effect this, however Accordingly he took passage in a merchant ship to the island of Sancian, near Macao, which was at that time the trading port of the Chinese with merchants from Portugal Here, having obtained a Chinese interpreter, he hoped to induce some native merchant to land him secretly on

the coast. His plan was baffled by the fears of the Portuguese, who dreaded that the Chinese authorities would punish this infraction of the law.

Xavier's disappointment was keen. For years his heroic zeal had tempted him to labors beyond his strength, and his sublime charity had exposed him to privations which had undermined his constitution. He fell ill of fever, for which his attendants could find no means of relief. On the very threshold of what he looked forward to as the greatest opportunity of his missionary life, the saint passed away, on the island of Sancian, according to late biographers, Nov. 27, 1552, though the date December 2 has always been given hitherto. Many miracles were ascribed to him. He was beatified by Pope Paul V in 1619 and canonized by Pope Gregory XV in 1622. His feast day was fixed upon December 3. His only literary remains are a catechism, some short ascetic treatises, and a collection of letters. Of the letters there are translations in most of the modern languages.

Consult Coleridge, *Life and Letters of Saint Francis Xavier* (London, 1872); Cros, *Saint François de Xavier, sa vie, son pays, sa famille* (Toulouse, 1900-01); *Monumenta Xaveriana* (Madrid, 1899-1900). For his work in Japan, see Carey, *A History of Christianity in Japan* (London, 1909), for that in India, Richter, *History of Missions in India* (New York, 1908).

FRANCK, frank, ADOLPHE (1809-93). A French philosopher, born at Locourt, Meurthe, of Jewish parents. He was educated at Nancy and Toulouse and became professor of philosophy at the Collège Chaligny in Paris in 1840. In 1844 he was elected a member of the Academy of Moral and Political Sciences. He held the chair of Greek and Latin philosophy at the Collège de France from 1849 to 1852 and from 1854 to 1881 lectured there on natural law and the law of nations. He was one of the editors of the *Journal des Débats* and the founder of *La Paix Sociale*, the organ of the league against atheism. Among his works are *De la certitude* (1847), *Dictionnaire des sciences philosophiques* (1843-52, new ed., 1875), of which he edited the greater part, *La kabbale* (1843, 9th ed., 1892, and in German version), *Le communisme jugé par l'histoire* (1849), *Etudes orientales* (1861), an attack on pantheism, *Philosophie et religion* (1867), *La religion et la science dans le judaïsme* (1883), *Nouveaux essais* (1890), and, ed. by Manuel, *Nouvelles études orientales* (1896).

FRANCK, CÉSAR AUGUSTE JEAN GUILLAUME HUBERT (1822-90). A French composer, born at Liège. After studying at the conservatory there he went to Paris, where he attended the Conservatory, studying under the organist Benoist and others. He settled in Paris, and in 1872, at the Conservatory, succeeded Benoist, who retired after 50 years of service. Meanwhile Franck had composed much, but found little recognition, though it is interesting, as indicating Liszt's breadth of judgment, that in the fifties chamber music by Franck was played in Liszt's private concerts at Weimar. In 1846 Franck's oratorio *Ruth* was brought out at the Conservatory, but without success. Yet 25 years later it was revived at the Cirque d'été, and the following year at the Conservatory, with such brilliant results that a "Franck cult" was instituted among the younger French musicians. However, throughout the master's life the circle

of his admirers was small, though select. Only since the beginning of the present century has his real greatness been appreciated. Franck is the direct successor of Berlioz, but surpasses him in fertility of invention and resourcefulness, except in the field of instrumentation. As an instrumental composer, Franck cultivated both the classical forms—though frequently departing, especially in the development sections, from strict tradition—and the modern forms of Liszt and Berlioz. His principal works are the oratorios *Ruth* (1846), *The Redemption* (1872), *Les Béatitudes* (1880), *Rebecca* (1881), a symphony in D (1889), the symphonic poems *Les Éolides* (1876), *Le chasseur maudit* (1884), *Les Djinns* (1884), *Psyché* (1888), a mass, two operas, *Hulda* (1885) and *Ghisele* (1889), important works for organ, and excellent chamber music. Consult G. Dérépas, *César Franck* (Paris, 1897); E. Etranges, *L'Œuvre lyrique de César Franck* (ib., 1897); F. Baldensperger, *César Franck* (ib., 1901); V. d'Indy, *César Franck* (ib., 1906), trans. by R. Newmarch (London, 1909); J. Rivière, *Études* (Paris, 1911).

FRANCK, frank, MELCHIOR (c. 1580-1639). A German composer, born at Zittau. He lived in Augsburg, where his first works were published in 1601. The following year he went to Nuremberg and in 1603 became chapelmaster at Coburg. His best work is in sacred music, and some of his chorals are still sung. He is one of the most prolific and interesting of the old German composers.

FRANCK. SEBASTIAN (1499-1542). A German reformer and humorist, born at Donauwörth. Ordained to the Roman priesthood in 1524, he joined the Reformation shortly afterward, married in 1528, and, after some minor didactic works, published at Strassburg in 1531 his *Chronika*, one of the first German attempts at universal history. Driven from Strassburg through the influence of Erasmus, he led a wandering and precarious life as a soap boiler, author, and printer, and in 1539 settled at Basel, where he died. He appears to have been a pantheistic mystic, a forerunner of modern German idealism, of wide social sympathies and broad tolerance. His style is vigorous and clear—far superior to that of his time. His collection of *Sprichwörter* (1541) is edited by Guttenstein (1831), his *Weltbuch Spiegel und Bildnis des ganzen Erdbodens* (1534) is a geographical work of merit. For his life, consult Wenkauff, in Birlinger's *Alemanna* (Bonn, 1877); Hagemacher (Zurich, 1886); Tausch, *Sebastian Franck von Donauwörth und seine Lehren* (Halle, 1893).

FRANCKE, frank'e, AUGUST HERMANN (1663-1727). A distinguished German educator and philanthropist, founder of the Francke Institutes (*Stiftungen*) at Halle. He was born at Lubeck. In the early years of his manhood his interests were primarily theological. His orthodoxy was called into question, however, partly because of the envy caused by his extraordinary popularity as a preacher, and he was therefore unable to hold his position as lecturer at Leipzig. While still a young man, his attention had been drawn to the unsatisfactory state of the German educational methods, and when, in 1695, he was called to assume the duties of pastor in a small town near Halle, he started a private school in his own house. The school grew rapidly, and Francke found it necessary to

rent a building to accommodate it. In connection with it he founded a school for the children of well-to-do parents, and in 1697 he added a Latin school and a school for girls. Arrangements were made to care for orphans, and poor scholars received their meals free of charge. A corps of able teachers gathered around him, new buildings were erected, a bookseller's shop and other forms of business were undertaken to help to defray expenses. Francke's theological enemies sought to injure his thriving educational institute, but in 1713 the King of Prussia, Frederick William I, visited it and promised Francke his support. From that time the institute grew unchecked, until at Francke's death the Pedagogium, or school for the children of the wealthy, had 40 students, the Latin school 400, the common schools 1725. One hundred and seventy-five teachers were employed, all of whom were students at the University of Halle. They received their board, and afterward their lodging, for their services. A seminary for teachers was established as early as 1707, which aimed to train young men in the methods of teaching. Thus the institute became the foremost training school of the time for teachers. The extraordinary success of Francke's Institute led to the establishment of similar institutions in other German cities, and the influence of Francke and his disciples materially affected the character of the Prussian system of public education, which was established by Frederick William I and remains unchanged in its essential features at the present day.

Francke published a number of pamphlets on religious and pedagogical subjects, but these are of minor importance as compared with his institutional work. Consult Kramer, *Franckes pädagogische Schriften* (Langensalza, 1885), id., *August Hermann Francke, ein Lebensbild* (Halle, 1880-82), Stein, "August Hermann Francke," in *Deutschen Geschichts- und Lebensbildern* (ib., 1894), Fries, *Die Franckeschen Stiftungen in ihrem zweiten Jahrhundert* (ib., 1898).

FRANCKE, KUNO (1855-) A German-American scholar and author, born at Kiel. He was educated at the University of Munich and was appointed professor of German literature and subsequently professor of the history of German culture at Harvard University, Cambridge, Mass. He also became curator of the Germanic Museum of Harvard University. His publications include *Zur Geschichte der Schulpoesie des zwölften Jahrhunderts* (1878), *De Hymno in Cerecerem Homericum* (1880), *Libelli de Lite Imperatorum et Pontificum* (1892), *Social Forces in German Literature* (1896), *Glances of Modern German Culture* (1898), *a History of German Literature* (8th ed., 1907), *a Handbook of the Germanic Museum* (1908), *Die Kulturwerte der deutschen Literatur im Mittelalter* (1910).

FRANCKEN, frank'en. A family of painters of Antwerp, 11 in number, living in the sixteenth and seventeenth centuries. A similarity of Christian names leads to much confusion in classifying their works. When Frans the first found a competitor in Frans the second, he took the name of "the elder," the second being "the younger." But when the third Frans became a rival of the second, the latter took the name of "the elder," and Frans the third became "the younger." The eldest of the Franckens, NICHOLAES of HERENTHALS, died in 1596. None

of his work is known—HIERONYMUS (1540-1610), his eldest son and pupil, studied under Franz Floris and was occupied chiefly in Paris, and in decorating the Palace of Fontainebleau. He was court painter to Henry III, of whom he painted a portrait, which, like most of his works, has been lost. Among his surviving pictures is "The Beheading of John the Baptist," in Dresden. He painted in the hard, gaudy style of Floris.—The second son of Nicholaes was FRANS FRANCKEN "the first" (1542-1616). He studied under Floris and was dean of the Guild of St. Luke in 1588-89. He painted many portraits, including that of William of Orange, and religious subjects, the most important of which was the altarpiece "Christ among the Doctors" (Antwerp Cathedral). He is also represented in the museums of Antwerp, Dresden, Vienna, and in the Louvre—AMBROSIUS (1544-1618), third son of Nicholaes, and also a pupil of Floris, left more works than both his brothers. Most of them are religious subjects to be found at Antwerp, in the church of St. Jacques and the museum. Among the best of them are the "Miracle of the Loaves and Fishes" and the "Martyrdom of St. Cuspin," in the Antwerp Museum. He was also employed at Fontainebleau in 1570. His productions are in the style of the Floris school, and exaggerated in all respects, but he possesses greater invention than the rest. Frans "the first" trained his three sons to the profession.—The third of these sons was FRANS FRANCKEN (1581-1642) "the second," who also signed himself "the younger" until his son Frans grew up, when he signed himself "the elder." He studied in Italy and painted in the manner of the Floris school, but was later influenced by Rubens. Among his chief paintings are the "Works of Mercy" in the Antwerp Gallery, "Solon and Croesus," in the Brussels Gallery, "Christ Washing the Apostles' Feet," in the Berlin Museum, and the "Abdication of Charles V," in the Amsterdam Museum, formerly attributed to Hieronymus. He was the most important member of the family, and nearly all European galleries possess his pictures—FRANS FRANCKEN "the third" (1607-67) imitated Rubens in his religious subjects, of which there are good examples in Antwerp and Augsburg, and painted the figures in pictures of other masters, in particular of Peter Neefs the younger, as may be seen at Dresden and The Hague.

FRANCKENSTEIN, frank'en-stin, GEORG ARBOGAST, BARON (1825-90). A German legislator. He was born at Würzburg and was educated at Munich. An Ultramontane member of the Bavarian Diet, he opposed the participation of Bavaria in the Franco-German War and voted against the entrance of the kingdom into the German Empire. In the Reichstag he led the Centrist party. He drafted the "Frankenstein Clause," later incorporated as paragraph 7 of the tariff laws (July 9, 1879). He was First Vice President of the Reichstag from 1879 to 1887. Consult Fah's sketch (Freiburg, 1891).

FRANCO-GERMAN WAR OF 1870-71
The immediate cause of this struggle was France's jealousy of the growing importance of Prussia, which power Bismarck was determined to place at the head of a united Germany, and the desire of Napoleon III to strengthen his tottering throne by a successful war against the hereditary foe of the French nation. The actual occasion for the outbreak of hostilities was fur-

nished by complications growing out of the political situation in Spain. On June 25, 1870, Isabella II of Spain, who had been deposed in 1868, formally abdicated the throne. On July 5 the foreign governments were notified of her abdication, and on the same day the fact was made public that Prince Leopold of Hohenzollern had consented to become a candidate for the vacant throne of Spain. This consent was said to have the approval of the King of Prussia. The news caused intense excitement in Paris, and the Foreign Minister, the Duc de Gramont, caused representations to be made to the Prussian government of the displeasure with which the French government regarded the candidacy of Prince Leopold. On July 12 the announcement of the withdrawal of Prince Leopold's candidature was made. On the following day the French Ambassador, Benedetti (q.v.), unceremoniously addressing William I at Ems, insisted that the King should make a declaration to the effect that no Hohenzollern prince would ever be permitted to accept the Spanish crown. The King declined to listen to this demand and broke off the interview. He sent Bismarck a copy of the French demand, with authority to make use of it. This Bismarck did, giving to the press such parts of the communication as would tend to arouse the German people. It does not appear that in so doing he misrepresented the attitude of France. Taking notice of this publication as if it had been official, the French government, deeming itself called upon to take immediate steps for the defense of the national honor, formally declared war against Prussia, July 19, 1870.

While the popular enthusiasm in the two countries in favor of war was about equal, there proved to be a vast difference as to the state of the military preparations. The French government supposed that from 450,000 to 500,000 men were available for instant mobilization, but the army was ill organized, imperfectly equipped, and not properly provided with depots. But 250,000 men were ready for the first movements in August, 1870, and there was no reliable reserve. The French force was in one body, practically, known as the Army of the Rhine. Against this the North German Confederation was able to put into the field an army of about 450,000 men with a reserve of nearly 400,000. The French hoped that the South German states, out of jealousy of Prussia, would refuse to join her, but these joined forces at once with their countrymen, put their troops under Prussian command, and thus added to the overwhelming weight that was thrown upon France. The action of Prussia was promptness itself. King William arrived in Berlin July 15, meeting Bismarck, Moltke, and Roon, and orders for mobilization were at once given. Three armies were formed. The first, under General von Steinmetz, was placed near Trèves, forming the right wing, the second, under Prince Frederick Charles, was sent to Rhenish Palatinate, the third, under the Crown Prince of Prussia, took its position on the frontier of Baden. The French forces were scattered over a line of about 100 miles in length. The First Corps, under Marshal MacMahon, was placed near Strassburg, the Fifth Corps, under Faily, along the frontier of the Palatinate, the Third Corps, under Marshal Bazaine, near Metz; the Second Corps, under Frossard, not far from the Prussian frontier, near Saint-Avold; the Fourth Corps, under Lad-

mirault, near Thionville, the reserve forces, under Bourbaki and Marshal Canrobert, were partly at Nancy and partly at the camp of Châlons, the Seventh Corps, under Gen. Félix Douay, held the fortress of Belfort. These were the positions of the two contending armies towards the end of July, 1870. On the 23d of that month Napoleon appointed the Empress Regent of France, and on the 28th left Paris with the Prince Imperial to take command of the army at Metz. The King of Prussia left Berlin to take his place in the field July 31, accompanied by General von Moltke, as chief of staff, and Count Bismarck, and on August 2 established his headquarters at Mainz. On the same day a portion of Frossard's corps made an attack on the Prussian position at Saarbrück in the presence of the Emperor and his son. After protracted firing the Germans retreated, and the French occupied Saarbrück. The results of this engagement were unimportant.

The first serious conflict of the war took place, August 4, at Weissenburg, where the German advance guard was attacked by the French under Gen. Abel Douay, it ended, after a battle of five hours, in the French troops retreating in great disorder, with heavy loss. General Douay was killed. The Germans had now 520,000 men and 1170 guns ready for fighting orders, while the entire force of the French (with reserves) amounted to only 350,000 men. On August 6, at Worth, the Crown Prince attacked MacMahon, who had been strengthened by divisions of the corps of Faily and Canrobert. The French suffered a terrible defeat and lost 8000 in dead and wounded and 6000 prisoners. The German loss was over 10,000 officers and men. On the same day a bloody battle was fought at Spichern, near Saarbrück, also known as the battle of Forbach, between General Steinmetz and General Frossard. The Germans stormed the heights of Spichern, and the French force was thrown back in disorder on Forbach and Metz. The Germans lost 4648 men in killed and wounded, while the French loss amounted to about 2000 men killed and 2000 prisoners. Thus both wings of the French army were completely defeated, the original position could no longer be held, and all the French corps gathered into two large masses to retreat along the line of the Moselle. Two separate armies were now formed—the one known as the Army of Metz, commanded by Marshal Bazaine, and the other commanded by Marshal MacMahon. By August 14 the first German army had advanced to the immediate neighborhood of Metz and by a successful attack upon the French Third Corps under Bazaine baffled the first attempt of that commander to retreat to the line of the Marne. This developed into the sanguinary battle of Colombey-Nouilly, or of Courcelles. The Prussians lost nearly 5000 men in killed and wounded, the French loss was about 3500. The battle prevented the junction of Bazaine's army with that of MacMahon at Châlons. In the battle of Mars-la-Tour, or Vionville, fought on August 16, the army of Bazaine was repulsed by Prince Frederick Charles, and driven back on Gravelotte with immense loss to both sides—about 16,000. On the 18th occurred the great battle of Gravelotte (q.v.), in which 200,000 Germans fought against 130,000 Frenchmen. Bazaine's army, occupying a very strong position to the west of Metz, was, after nine hours' fighting, completely defeated, cut off from its com-

munication with Paris, and driven back towards Metz. The losses were very heavy. The French lost about 600 officers and 13,000 men, the Germans, about 900 officers and 20,000 men.

Bazaine was now shut up in the fortifications of Metz, which was invested by Prince Frederick Charles. A fourth army was organized and placed under command of the Crown Prince of Saxony, to move rapidly upon Paris. MacMahon, marching to the relief of Metz, was cut off by the third and fourth German armies, which were converging on Paris, and on the 1st of September was fought the battle of Sedan, the Waterloo of the Second Empire. The forces of MacMahon were caught in an unfavorable position, where they could be attacked from all sides, and were driven upon the fortress of Sedan, where, surrounded and defeated, the entire army surrendered (September 2), with the Emperor, who was carried prisoner to Wilhelmshöhe. By this capitulation 83,000 men, including 40 generals, 230 officers of the staff, and 2595 officers, became prisoners of war, in addition to 21,000 men who had been made prisoners during the battle. Meanwhile, on August 31, Bazaine made a sortie from Metz, attempting, during that day and the following, to break through towards the north, but was driven back into the fortress.

When the news of the capitulation of Sedan and of the capture of Napoleon reached Paris, it caused an upheaval. On September 4 the Third Republic was proclaimed, and a Government of National Defense was formed, of which the chief members were Jules Favre, Crémieux, Ferry, Jules Simon, and Gambetta. General Trochu, the military Governor of Paris, was its head. Gradually the Germans closed in on Paris, no serious resistance in the field being attempted. By September 19 the capital was regularly invested. The investing force was far inferior to that of the besieged in numbers, but the French forces in Paris were largely a half-trained provisional levy, brimming with disaffection and the spirit of revolution, which afterward broke out in the Commune. Strassburg surrendered on September 28. A few days later Gambetta escaped from Paris in a balloon and issued a proclamation from Tours calling for a levée en masse. On October 11 General Von der Tann, after defeating a French force, entered Orléans. On October 27 Bazaine surrendered at Metz with his army of about 175,000 men to Prince Frederick Charles. A gleam of hope was infused into the French by a momentary victory of Gen. Aurelle de Palladines, commander of the Army of the Loire, who on November 9 beat back Von der Tann at Coulmiers, near Orléans, the French reentering Orléans on the following day. On November 28, however, Aurelle de Palladines was repulsed at Beaune-la-Rolande, and was again defeated before Orléans on December 2-4. Nor were the other armies put into the field by the appeals of Gambetta more successful in coming to the relief of Paris, where General Ducrot made a desperate attempt to break through the German lines at Brié and Champigny, November 30-December 3. The army of General Chanzy engaged that of the Grand Duke of Mecklenburg on the Loire, December 7-10, but was forced to retreat from this scene of operations, and on Jan. 10-12, 1871, he was completely overthrown by Prince Frederick Charles at Le Mans. In the north, where the Germans had reached and entered

Rouen as early as December 6, the army of General Faidherbe suffered a defeat at Pont Noyelles, December 23, and another at Bapaume, January 3, and on January 19 it was overwhelmed by General Von Goeben at Saint-Quentin. In the east General Bourbaki made a diversion at the close of December which was at first successful, but he was repulsed by General Von Werder before Belfort on January 15-17. On December 27 the Germans opened a bombardment on Mont Aveion, one of the forts of Paris, and two days later they obtained possession of the fort. After an unsuccessful sortie from Mont Valerien, led by General Trochu, January 19, Paris, which had reached the point of starvation, capitulated Jan. 28, 1871, a partial armistice having been arranged between Bismarck and Jules Favre. Four days later the remains of Bourbaki's army retired into Switzerland. In the meanwhile, during the progress of the siege of Paris, the work of consolidating Germany into an empire had been consummated by the proclamation at Versailles, on January 18, of William I as German Emperor. The armistice gave France an opportunity to form a responsible government that could conduct peace negotiations. On February 8 elections were held for a National Assembly, which met at Bordeaux, February 12, and which, on February 17, elected Thiers Chief of the Executive. On February 16 the capitulation of Belfort closed the military operations. The Germans occupied all the forts around Paris. France was helpless, with nearly all her trained soldiers disarmed or prisoners of war, while French territory was occupied by a German army of more than half a million men. The new government of France now undertook the task of securing peace.

The indefatigable labors of Thiers resulted, on February 26, in the arrangement of preliminary terms of peace with Germany, which were formally accepted by the National Assembly, March 1, by a vote of 546 to 107. The terms of this treaty were as follows: (1) the cession by France of the German-speaking part of Lorraine, including Metz and Thionville, and of Alsace, excepting Belfort, (2) France to pay five milliards of francs as war indemnity—one milliard in 1871, and the balance in installments extending over three years, (3) the evacuation of French territory to begin upon the ratification of the treaty, Paris and some western departments to be evacuated at that time, the troops in other departments to be withdrawn gradually as the indemnity was paid, (4) the German troops to be maintained at the cost of France, and not to levy upon the departments occupied by them, (5) inhabitants of the annexed territories to be allowed to choose between the two nationalities, (6) prisoners of war to be immediately set at liberty, (7) negotiations for a definitive treaty of peace to be opened at Brussels after the ratification of this treaty; (8) the administration of the departments occupied by the German troops to be intrusted to French officials under the control of the chiefs of the German corps of occupation. The definitive treaty of peace was signed at Frankfurt, May 10, 1871. The two great results of the war were the establishment of the Third Republic in France and the consolidation of Germany into an empire.

FRANÇOIS, fran'swa', JEAN CHARLES (1717-69). A French engraver, born at Nancy He was the inventor of engraving in imitation of crayons, which obtained for him the position of engraver to the King His most important plates are a series of portraits for Savarin's *Histoire des philosophes modernes* (1761-69), "The Virgin," after Vien, "Erasmus," after Holbein, "Thomas Hobbes," after Pierre, and "The Dancer," after Boucher. From a technical point of view his work is of mediocre quality.

FRANÇOIS, KURT VON (1852-). A German cartographer and explorer of Africa. He was born at Luxemburg and served in the German army during the War of 1870-71, in which his father, General François, met his death at the battle of Spichern He was a member of Wissmann's African expedition in 1883 and in 1885 accompanied him and the Baptist missionary Grenfell on the expedition in which two tributaries of the Congo were explored In 1887 he penetrated from the coast at Togo northwestward to about the twelfth parallel, north latitude, and in 1889 he was appointed commander of the military contingent in German Southwest Africa As acting Imperial Commissioner, to which position he was appointed in 1891, he explored as far as Lake Ngami His vigorous warfare (1893-94) against the native chieftain, Henrik Witboi, an inveterate enemy of German domination, resulted in the total rout of the Hottentots Because of disagreements among his officers and the impossibility of a complete subjugation of the enemy, he resigned his commission in 1895 In 1901 he settled in German Southwest Africa He made valuable maps of southwest Africa, the Okavango region, etc, and wrote: *Im In-*

nen Afrikas. Die Erforschung des Kassai, in collaboration with Wissmann (2d ed, 1891), *Die Erforschung des Tschuapa und Lulongo* (1888), *Deutsch-Sudwestafrika Geschichte der Kolonisation bis zum Ausbruch des Krieges mit Witboi* (1899), *Krieg in Sudwestafrika* (1900), *Staat oder Gesellschaft in unseren Kolonien?* (1901), *Kolonisationssystem in unseren Kolonien* (1909)

FRANÇOIS, LUISE VON (1817-93) A popular German novelist She was born at Herzberg, Province of Saxony, and after the death of her father lived for several years at Weissenfels, Minden, and Halberstadt, but chiefly with her uncle, General Karl von François, at Potsdam Among her novels may be mentioned *Die letzte Reichenburgerin* (7th ed, 1900), *Frau Erdmuthens Zwillingssöhne* (2d ed, 1891), *Stufenjahre eines Glücklichen* (2d ed, 1878), *Der Katzenjunker* (1879) She wrote also several short stories and a play Consult Ebner-Eschenbach in *Velhagen und Klasings Monatshefte* (Leipzig, 1894)

FRANÇOIS DE NEUFCHÂTEAU, de nã'sha'to', NICOLAS LOUIS FRANÇOIS, COUNT (1750-1828) A French statesman and poet He was born in Lorraine and was educated at the Jesuit college of Neufchâteau, and this institution gave him its name after the publication in 1765 of a volume of poetry which was highly praised Encouraged by Voltaire, he obtained the chair of rhetoric at Toul in 1770 In 1783-88 he was *procureur général* in Santo Domingo He was deputy to the National Assembly and to the Legislative Assembly, of which he became secretary and finally President In 1793 he was imprisoned for the publication of a comedy, *Paméla, ou la vertu récompensée* In 1797 he became Minister of the Interior under the Directory, and in that post did much for inland navigation and for industrial exhibitions In 1804-06 he was President of the Senate After the Restoration he retired from politics His works include *Fables et contes en vers* (1814), *Les trois nuits d'un goutteux* (1819), and many miscellaneous articles (notably on agriculture) and translations Consult the biographical sketch by Lamoureux (Paris, 1843) and Simian, *François de Neufchâteau et les expositions* (ib, 1889)

FRANCOLIN (Fr, Sp *francolin*, Portug *francolim*, probably dim of Portug *frango*, *frangão*, chicken) A bird of the genus *Francolinus*, or related genera, of the family Phasianidæ, closely allied to partridges They are natives of Asia and Africa One species only (*Francolinus francolinus*) was formerly found in the most southern parts of Europe, but is now extinct there, though still common in various parts of Asia and in Cyprus About 45 of the 50 species of francolin known are found in Africa, and all are objects of sport and good for food

FRANCONIA (ML, from OHG *Franchun*, Franks) The name of a mediæval duchy in Germany, embracing the country on both sides of the Main, from the Rhine to the mountains of Bohemia It also included some territory on the west bank of the Rhine, around Mainz, Speyer, and Worms The region was conquered by Clovis and later was dependent upon Austrasia (qv) After the Treaty of Verdun (843) it was part of the German kingdom In 911 Conrad of Franconia was raised to the royal

throne, and a century later the choice of the German princes again fell upon the Franconian house, which, by its direct and collateral branches, gave kings and emperors to Germany from 1024, when Conrad II, the Salic, began his reign, till 1125, when Henry V died, and again from 1138, when Conrad III ascended the throne, till 1254, when Conrad IV, the last Hohenstaufen Emperor, died. Franconia was divided into Franconia Occidentalis and Franconia Orientalis (West and East Franconia). The former, in 1155, passed to Conrad, son of Frederick Barbarossa (qv), who was given the title of Count Palatine of the Rhine. During its connection with the crown, Franconia increased in extent and importance, while its great spiritual principalities of Mainz, Speyer, Worms, Bamberg, and Würzburg acquired both wealth and political influence. After 1155 the name Franconia was usually given only to the eastern portions of the ancient duchy. In 1512 Maximilian I established the circle of Franconia, without, however, including in it the Palatinate. With the dissolution of the Holy Roman Empire in 1806, the name of Franconia disappeared from among the political divisions of Germany, but since 1837 it has been revived in the Kingdom of Bavaria (qv), where those portions of the ancient Franconian region which had been known as the circles of the Upper Main, Rezat, and Lower Main are now designated Upper, Middle, and Lower Franconia.

Upper Franconia includes the northeast portion of Bavaria. It is watered by the Main, Saale, and other streams. Its surface rises in the Fichtelgebirge to a height of 3500 feet. Farther west are the mountains of the Franconian Forest, which are considerably lower. The valleys produce good crops and fruit, and the district is rich in minerals. Pop., 1900, 607,903, 1910, 661,126. The capital is Bayreuth.

Middle Franconia, which borders on Württemberg, is intersected by branches of the Franconian Jura, but has few rivers of importance besides the Regnitz and Altmühl, which are connected by the great Ludwigskanal. It produces good wine, but is principally celebrated for its hop gardens. Pop., 1905, 868,072; 1910, 929,985. The capital is Ansbach. Nuremberg is the principal town.

Lower Franconia, which occupies the northwest part of Bavaria, is the richest and best cultivated of the Franconian districts, and is celebrated for the excellence of its wines. The district is noted for its mineral springs at Kissingen, Brückenau, and Wipfeld. Pop., 1900, 650,758, 1910, 709,832. The capital is Würzburg. Consult Stein, *Geschichte Frankens* (2 vols., Schweinfurt, 1883-86).

FRANCONIA MOUNTAINS. See WHITE MOUNTAINS.

FRANCS-TIREURS, frān'tè-rēr' (Fr., free-shooters). The name given to bands of French soldiers that sprang into existence during the Franco-German War of 1870-71. They had their origin in the military societies formed in northeastern France as early as 1867. They did not form a part of the regular army until November, 1870, and at first their military organization was very imperfect. They waged irregular warfare by attacking small detachments of the enemy and baggage trains as well as single travelers. At first they were not recognized by the Germans as having any military standing at all, and when seized were shot or

hanged, but after a time, when they received a better organization, and cooperated with the regular French army, such recognition was accorded them. They carried on an irregular warfare long after the main French armies had been wiped out. Their most celebrated feat was the blowing up of the Moselle Railway Bridge at Fontenoy, Jan 22, 1871. Consult *Les Chasseurs des Vosges* by Lieutenant Colonel Saint-Etienne (Toul, 1906). See GUERRILLAS.

FRANCUCCI, fran-kōō'che, INNOCENZO. See IMOLA, INNOCENZA DA.

FRANEKER, fran'e-kēr. A town of the Netherlands, in the Province of Friesland, situated on the canal between Harlingen and Leeuwarden (Map Netherlands, D 1). It was formerly the seat of a university founded in 1585 by the Frisian states and abolished by Napoleon in 1811. The church of St Martin dates from the fifteenth century, a town hall (restored) was built in 1591, and there is also a curious astronomical model, showing the motions of the planets, built in 1774-81 by a citizen. Other institutions are an atheneum and an observatory. The town manufactures bricks and oil, builds ships, and carries on trade in grain and flax. Pop., 1901, 7187, 1911, 7642.

FRANGIPANI, fran'je-pa'ne (named after the Marquis Frangipani, major general under Louis XIV). A scent or perfume, either derived from or manufactured in imitation of a flower produced by a West Indian tree of the genus *Plumiera*, called the red jasmine.

FRANGIPANI. An illustrious and powerful Roman house, which began with Leo Frangipani in 1014 and attained the summit of its power in the eleventh and twelfth centuries. The residences and strongholds of the Frangipani were near the Arch of Titus and the Coliseum. The rivalry of the Frangipani with the house of the Pierleoni not only occasioned repeated civil wars in the state, but likewise troubles in the church. In the early part of the twelfth century the two families controlled the college of cardinals. The Frangipani were usually partisans of the Emperor, the Pierleoni usually opponents. After the death of Frederick II, however, the family interest was enlisted in the papal cause. Giovanni Frangipani captured Conradin of Hohenstaufen and delivered him, in 1268, to Charles of Anjou. The origin of the name Frangipani is attributed to the family's benevolent distribution of bread in time of famine. Consult Gregorovius, *Rome in the Middle Ages*, vols. iv-v (London, 1896-97).

FRANGIPANI was also the name of a noble family of Croatia, whose members distinguished themselves in the wars against the Turks. The most celebrated of the line were John Frangipani, who about 1390 was made Ban of Croatia, Slavonia, and Dalmatia, and Christopher Frangipani, who fought at Mohács (1526). Francis Christopher Frangipani about 1670 entered into a conspiracy against the Emperor Leopold I, having for its ultimate object the restriction of Germanic influences in Hungary and the reassertion of the Magyar power. The conspiracy was discovered and Frangipani was executed in 1671.

FRANK, frank, ALBERT BERNHARD (1839-1900). A German botanist, born in Dresden and educated at Leipzig. From 1881 until his death he was professor of plant physiology at the Agricultural College at Berlin. His works consist chiefly of valuable textbooks and include:

Die Krankheiten der Pflanzen (1880), *Lehrbuch der Pflanzenphysiologie mit besonderer Berücksichtigung der Kulturpflanzen* (1890), *Pflanzenbuch für medice und mittlere Landwirtschaftsschulen* (1894), *Kampfbuch gegen die Schädlinge unserer Feldfrüchte* (1897), with Kruger, *Schuldlausbuch* (1900)

FRANK, FRANZ HERMANN REINHOLD VON (1827-94) A German Lutheran theologian, born at Altenburg and educated at Leipzig. He was professor of theology at Erlangen from 1857 until his death, was cofounder of the *Neue Kirchliche Zeitschrift*, and wrote a large number of works, most of which have been several times republished. These include *System der christlichen Gewissheit* (2d ed, 1885-86, Eng trans by Evans, 1886), his most characteristic work, *System der christlichen Wahrheit* (2d ed, 1885-86), *System der christlichen Sittlichkeit* (1884-87), *Zur Theologie d. Ritsch's* (3d ed, 1891), *Geschichte und Kritik der neueren Theologie* (1894, 3d ed, 1898). Consult Seeburg's memoir (Leipzig, 1894) and Weber, *Franks Gotteslehre* (ib, 1901)

FRANK, GUSTAV WILHELM (1832-1904) A German Protestant theologian, born in Schleiz. He was educated at Jena and held a professorship at that university from 1864 to 1867, when he was appointed professor of dogmatics and ethics at the University of Vienna. He retired in 1902. He edited Apelt's *Religionsphilosophie* (1860) and wrote *Geschichte der protestantischen Theologie* (1862-75), *Die evangelisch-theologische Fakultät in Wien von ihrer Gründung bis zur Gegenwart* (1871), and *Das Toleranzpatent des Kaisers Joseph II* (1882).

FRANK, JACOB (1726-91) A pseudo-Messiah of the Jews and founder of a sect called Frankists after himself, or Zoharites after their sacred book. His real name was Jakob Lebowicz, and he was the son of a rabbi of southern Galicia. When a young man, traveling in the East, the Turks called Jakob a Frank, their common appellation for a European, and this surname he always retained. He and his father were members of a semi-Mohammedan sect, the shabbathians. He returned to Poland in 1755 and became the centre of a secret society, against which charges of immorality were made before the rabbis. Later he claimed to have direct revelations from heaven, calling for the conversion of his followers to Christianity, as a transition stage to a future Messianic religion. In 1859 the Frankists were baptized in Lemberg, many of the Polish nobility acting as sponsors. Almost immediately Frank's sincerity was doubted, and in 1760 he was imprisoned; but this only made his followers more faithful. After his release he spent the rest of his life in Offenbach, a small German town, supported in luxury by the gifts of his followers. The Frankists were gradually absorbed in the Christian community. Consult Graetz, *Frank und die Frankisten* (Breslau, 1868)

FRANK, JOHANN PETER (1745-1821). A German physician. He was born at Rothalben, Bavaria, and studied medicine at Heidelberg and Strassburg. In 1785 he accepted a call to Pavia, where he remained until his appointment to the directorship of the General Hospital at Vienna (1795). With this institution he was associated until 1804, during which time he also delivered lectures at the university. After a short term as professor of medicine at Vilna, Russia, he was appointed physician in ordinary

to Czar Alexander I, returning to Vienna in 1808. His influence upon the development of medical practice in Lombardy, Austria, and Russia was extraordinary. He devoted himself chiefly to the improvement of public sanitation, of which he has been called the founder, and several of the works written by him on this subject have served as a basis for the further development of sanitary legislation. His principal works include *System einer vollständigen medicinischen Polizei* (6 vols, 1779-1819, supplement, 3 vols, 1812-27, trans into Italian, 1808-30), *De Curandis Hominum Morbis Epitome* (6 vols, 1792-1821, German trans, 3d ed, 1840-41), *System der landwirtschaftlichen Polizei* (1789-91) *Selbstbiographie* (1802). Consult Seiler's *Peter Frank* (Dresden, 1895)

FRANKALMOIGNE, fränk'äl-moi' (Lat *libera elemosyna*, free alms) A form of feudal tenure, whereby lands were held by religious houses or persons for charitable purposes. By the ancient common law of England, a man could not alien lands which came to him by descent without consent of his heir, but he might give a part to God in free alms. It was an old Saxon tenure and continued under the Norman revolution, through the great respect that was shown to religion and religious men. This is the tenure by which almost all the ancient monasteries and religious houses held their lands, and by which the parochial clergy and very many ecclesiastical foundations hold them at this day. The Statute of 12 Car II, c 24, which abolished the old tenures, specially reserved tenure in frankalmoigne. A tenant in frankalmoigne did no fealty to his overlord, and in the event of failure to perform the service the latter was not entitled to distrain, but might complain to the ordinary or visitor. In this respect this tenure differed from tenure by divine service, i.e., where lands were given on condition of performing a specified service, as saying a mass on a particular day, or distributing certain alms. In this case the tenant was bound to render fealty and the lord was entitled to distrain on failure to perform the service. By the Anglo-Saxon law, lands held in frankalmoigne were subject to the *trinoda necessitas* of repairing highways, building bridges, and repelling invasions. In Scotland lands conveyed to the Church in *puram elemosynam* were said to be mortified. See FEE, FEUDALISM, TENURE Cf MORTMAIN

FRANKAU, MRS JULIA See DANBY, FRANK

FRÄNKEL, fränk'el, BERNHARD (1836-1911) A German physician. He was born at Elberfeld and was educated at Würzburg and Berlin, where in 1884 he was appointed professor. In recognition of his valuable investigations on diseases of the throat and nose, he was, in 1887, made director of the clinical institute of the university especially devoted to the treatment of those diseases. He wrote on diseases of the nose for Ziemssen's *Handbuch der speziellen Pathologie und Therapie* (1879), "Skrofulose und Tuberkulose," in Gerhardt's *Handbuch der Kinderkrankheiten* (1878), and *Der Kehlkopfkrebs* (1889). After 1900 he edited the *Zeitschrift für Tuberkulose und Heilstatistik*

FRÄNKEL, WILHELM (1841-95) A German engineer. He was born at Odessa, Russia, and was educated at the Polytechnic Institute at Dresden, where he was appointed professor in 1869. His articles on bridge and railroad con-

struction include "Bewegliche Brücken," in the *Handbuch der Ingenieur-Wissenschaften* (2d ed., 1888)

FRANKEL, fränk'el, ZECHARIAS (1801-75) A German Jewish theologian, born in Prague. He graduated from the University of Budapest in 1831, was rabbi at Leitmeritz, Bohemia (1832-36), and at Dresden (1836-54), and afterward, as president of Breslau Seminary, he introduced modern scientific and critical studies as a part of the rabbinical education. Though approving religious research, he remained an orthodox Hebrew. He edited the *Zeitschrift für die religiösen Interessen des Judentums* in 1844-46, and the *Monatsschrift* in 1851-68. His works include *Die Eidesleistung bei den Juden in theologischer und historischer Beziehung* (1840, 2d ed., 1847), *Historisch-kritische Studien zu der Septuaginta nebst Beiträgen zu der Targumim Vorstudien zu der Septuaginta* (1841), *Der gerichtliche Beweis nach mosaisch-talmudischem Recht* (1846), *Darke ha-Mishnah* (1859)

FRANKENBERG, fränk'en-bërk. A flourishing manufacturing and trading town of Saxony, Germany, 32 miles southwest of Dresden (Map Germany, E 3). Its institutions include a gymnasium, a trade school, a teachers' seminary, and a textile school. It has manufactures of cottons, woollens, silk stuffs, carpets, draperies, dyes, furniture, castings, machinery, cigars and the largest calico-printing works in Saxony. Near by are many ruined churches and castles, at one of which is an iron cross, dedicated to the poet Körner. Pop., 1900, 12,726, 1910, 13,576

FRANKENHAUSEN, fränk'en-hou'zen. A town of the Principality of Schwarzburg-Rudolstadt, Germany, on the Wipper, 27 miles north-northwest of Weimar (Map Germany, D 3). It has a teachers' seminary, a gymnasium and a technical institute. There are productive salt springs here, and the manufacture of cigars, sugar, and articles in mother-of-pearl is carried on. Its baths are much frequented for curing scrofula. In the neighborhood are mines of lignite, sandstone quarries, and the Barbarossa cavern, discovered in 1865. Pop., 1900, 6383; 1910, 6600. Frankenhäusen was the scene of a battle between the rebellious peasants under Thomas Münzer, May 15, 1525, and the Saxon, Brunswick, and Hessian troops, in which the former were defeated.

FRANKENSTEIN, fränk'en-stin, OR, THE MODERN PROMETHEUS. A novel by Mrs Shelley, begun in 1816, and published anonymously at London in 1818. An American edition appeared at Philadelphia in the same year, and another at Boston in 1869. The title character of the tale is a student who finds the secret of creating life artificially. His first creation is a horrible yet pathetic monster, who murders his friend and pursues Frankenstein himself from one land to another, complaining of his loneliness and begging his unfortunate maker to create a mate for him.

FRANKENTHAL, fränk'en-tal. A flourishing industrial town of Germany, situated in the northeastern part of the Bavarian Palatinate, about 10 miles northwest of Mannheim and near the Rhine, with which it is connected by a canal. The portal of the abbey church, founded in 1119, is very interesting, also a monument to veterans of the Napoleonic Wars. The industrial establishments of Frankenthal include machine shops, iron foundries, and sugar refineries, the manufacture of dynamos, machinery,

boilers, school furniture, cooperage, corks, toys, gymnastic apparatus, soap, church bells, and cement goods. Frankenthal dates from the eighth century. Pop., 1900, 16,849, 1910, 18,779

FRANKFORT, or **FRANKFORT-ON-THE-MAIN** (Ger. *Frankfurt am Main*, pron. fränk'-fört am min). A city of Prussia, in the Province of Hesse-Nassau, Government District of Wiesbaden, situated on the right bank of the navigable Main, 24 miles above its confluence with the Rhine at Mainz (Map Germany, C 3). It lies in a fertile and picturesque plain surrounded by mountains. The city embraces the important suburb of Sachsenhausen on the left bank, with which it is connected by several stone or iron bridges. Other towns formerly separate but now incorporated with Frankfort are Bornheim, Bockenheim, Niederad, Oberrad, and Seckbach. Frankfort still has many old and narrow streets with high-gabled projecting houses, but its ancient walls and ramparts have been converted into promenades, and there are now wide handsome streets and broad quays in the modernized sections. The gates of the famous Judengasse (Ghetto), which were closed at night to prevent the egress of the Jewish inhabitants, were razed at the time of the French occupation in 1806. Gradually all the interesting old houses in this street, now called Bornestrasse, have been torn down, except the family house of the Rothschilds, one of the attractions for sightseers. In the heart of the ancient town is the Römerberg, or market place, with the Justitia Fountain in its centre. It was the scene of popular rejoicings after the election of a king. Hebrews were formerly not allowed to enter this square. The main artery of the new town is the Zeil, continued by the Kaiserstrasse. The most prominent squares are the Rossmarkt with the Gutenberg Monument, the Goetheplatz with Schwanthaler's statue of Goethe, the Schillerplatz with the statue of Schiller, the Kaiserplatz with an attractive fountain, the Borsenplatz, and the Opernplatz. Among the spacious streets leading to the outer quarters of the city the Bockenheimer Landstrasse is the most noteworthy.

The ancient cathedral of St Bartholomew ranks first among Frankfort's ecclesiastical structures. Founded about 870, it was built after Gothic patterns at different periods between 1235 and 1415. The election of the German kings, and from 1558 the coronation of the Roman emperors, took place here. The Wahlkapelle (election chapel) dates from 1355. The cathedral was seriously damaged by fire in 1867, and its restoration was completed in 1881. Of the other Roman Catholic churches, there may be mentioned the church of St Leonhard, erected in 1219-1507, and the church of Our Lady (consecrated 1340). The leading Evangelical churches are the Paulskirche, erected in 1787-1833 and memorable as having been the seat of the National Parliament of 1848-49, the Nikolaikirche, a graceful edifice of the thirteenth century; the Katharinenkirche, built in 1678-81, containing fine monuments and paintings, and the new church of St Peter (1892-95), with a tower 250 feet high. The most prominent among the ancient secular buildings is the Römer, which is in reality a group of 12 separate mediæval houses, reconstructed and enlarged at various times. Here in the Kaisersaal, or Imperial Hall, the newly elected King held his public banquet. The hall is em-

bellished with good modern portraits of the German kings and Roman emperors, from Charlemagne to Francis II, 52 in all. Other interesting old structures are the Leinwandhaus, or Draper's Hall, a fifteenth-century building reconstructed in 1892 as the Municipal Historical Museum, which contains a valuable collection of antiquities and some paintings, and among whose documents the Golden Bull is preserved (see *History*, below), the Gothic Haus Fursteneck, the Steinerne Haus of 1464; the Haus zum grossen Engel of 1562, half Gothic and half Renaissance, the Tuchgaden, where the guild of butchers was wont to celebrate the coronation of the emperors, the Goldene Wage, with an ornate façade, and the Haus zum Rebstock, with its picturesque court. More famous is the Goethe house, in which the poet was born in 1749 and lived till 1775. The house is now to be seen as it was in Goethe's youth, the restorations and refurnishings being due to the Deutsche Hochstift. The adjoining Goethe Museum contains portraits, autographs, letters, etc., and also the Goethe Library, which contains some 25,000 volumes representative of or dealing with the Goethe period of German literature.

Among the modern public buildings are the City Library, having a fine Corinthian portico, the Municipal Record Office, the new Exchange with a handsome hall and rich façade, the beautiful opera house, accommodating 1900 spectators, the law courts and the post office, and the magnificent Central Railway station, opened in 1887. In Sachsenhausen is situated the splendid Stadel Art Institute, in the Italian Renaissance style, with a fine portal and a dome. Its notable picture gallery is especially rich in specimens of the Dutch and the early Flemish masters and of the older Dusseldorf school. Hals, Brouwer, Teniers the Younger, Van der Weyden, and Van der Velde are well represented, and Van Eyck and Moretto merit particular attention. Among the moderns, Overbeck, Veit, Lessing, Bocklin, and Lenbach are also to be seen to advantage. The gallery comprises, in addition, some interesting sculptures, and one of the best collections of engravings in Germany (numbering 60,000 examples), and a school of art for students of painting, sculpture, and architecture. The environs and the public grounds which surround Frankfort, on the site of the ancient fortifications, are very attractive. The Taunus promenade is especially noteworthy. Among the statues and monuments not already mentioned are those of William I, Borne, and Charlemagne (on the picturesque medieval Old Bridge across the Main), and Schopenhauer, who lived in Frankfort from 1831 to 1860.

The important commercial standing of Frankfort is due chiefly to its financial strength, although its industries developed considerably during the last quarter of the nineteenth century. The manufactures include chemicals (principally printer's ink), gold and silver wire, machinery, carpets, drugs, tobacco, and electric supplies. The city is the seat of many of the most important industrial and mercantile associations of southern Germany, as well as the home of some of the strongest moneyed institutions in the world, the banks of Frankfort having been famous since the days of the early Rothschilds. Commercially it was well known as early as the sixteenth century, when its semi-

annual fairs attracted merchants from every direction. With the establishment of the German Customs Union and the development of continental railway systems, its advantages have considerably diminished in importance. The supremacy in the book-publishing trade, which Frankfort enjoyed for many generations, was long ago gained by Leipzig. The city is one of the most important railway centres of Europe, and its shipping, through the recent canalization of the Main and important improvements of the river harbor, has considerably increased.

The government is administered by a chief burgomaster, an assistant burgomaster, 24 magistrates, 3 assessors, and a council of 64 members. The municipality operates its own water works and gas plant, but has leased its street railways to a private company. The water supply is excellent. The superior sanitary conditions have reduced the death rate to a low figure. The educational institutions include an Academy of Social and Commercial Sciences, a free Institute of Higher Education (*Hochstift*), three gymnasia, a number of realschulen, an industrial art school, several music schools, a teachers' seminary, and several homes for imbecile and physically deformed children. The Museum of Art and Industry has an interesting collection of furniture, china, bronzes, panelings, etc. The municipal library contains about 350,000 volumes, a collection of coins, and Maichese's marble statue of Goethe. There are also not a few smaller public libraries, reading rooms, learned societies, art leagues, and botanical and zoological gardens. The three important theatres receive subsidies from the city. The hospitals and other charitable institutions are numerous and creditable examples of their kind.

In 1817 Frankfort had 41,458 inhabitants, in 1840, 55,269, in 1871, 59,204. Since 1871 the population has increased enormously, partly because of the annexation of suburban districts. In 1880 the population was 136,819, in 1890, 179,985, in 1900, 288,989, in 1905, 344,951, in 1910, 414,576, of whom 250,505 were returned as Evangelical, 129,867 Roman Catholic, and 26,228 Jewish. The area of the city at the 1910 census was 135 square kilometers (52 square miles).

History. Although Frankfort does not appear in history until 793, it is probable that at a very early period some settlement occupied the present site of the city, which was then the meeting place of a number of Roman military roads running from Mainz east. In 794 Charles the Great held a church council at Franconovurd (see FRANKFORT, COUNCIL OF), and mention is made at the same time of a palace there, which Charles's son, Louis the Pious, greatly enlarged in 823 and made his residence. After the partition of Charles's empire, Frankfort became the capital of the East Frankish Kingdom, and as such it frequently appears in the documents of the time in connection with many important diets and ecclesiastical assemblies. Its political importance declined after the extinction of the Carolingian dynasty, but it still remained an important centre of trade. After 1152 the kings of the Germans were chosen at Frankfort, and this custom was formally sanctioned by the Golden Bull of 1356, which made it the *Wahlstadt*, or Electoral City of Germany. In 1245 Frankfort attained the rank of a free Imperial city, and from that time until about the middle of the fourteenth century it steadily acquired greater powers of self-government, including an

independent mint Frankfort adopted Protestantism about 1530, and in 1536 it joined the Schmalkaldic League (q.v.), for which it had to pay a fine of 80,000 gulden. After the middle of the sixteenth century the German emperors were crowned here. The town suffered severely from pestilence during the Thirty Years' War. Like many another city of Germany, it was ruled for hundreds of years by a merchant oligarchy, which bitterly resisted all attempts on the part of the guilds to secure a share in the government. In 1612 a popular insurrection under the leadership of one Fettmilch broke out against the misgovernment of the patrician families. The lower classes improved the opportunity to vent their spite upon the Jews, who from an early period constituted an important element of the population. The Jews were forced to flee from the city, and for four years the popular leaders were in power. Order, however, was restored in 1616 by the intervention of the Emperor. The Jews were restored, and the only result of the insurrection was to strengthen the ruling oligarchy. The political power of the trade guilds was completely swept away and passed into the hands of the city rulers. In the revolutionary wars Frankfort was occupied by the French in 1792, in 1796, and again in 1806. Each time she had to pay an extremely large tribute. In 1806 it ceased to be a free Imperial city and was given by Napoleon to Dalberg, the Primate of the Confederation of the Rhine. In 1810 Napoleon created for Dalberg the Grand Duchy of Frankfort, having an area of about 3200 square miles. This disappeared with the downfall of Napoleon, and Frankfort regained its rank (along with Hamburg, Bremen, and Lubeck) as a free city at the Congress of Vienna, and in 1816 became the capital of the German Confederation. During the revolutionary period of 1848 it was the very centre of German nationality and the battle ground of the opposing tendencies of the time. The Vorparlament (q.v.) met there on March 31, 1848, and from May 18, 1848, to May 30, 1849, it was the seat of the National Assembly convened to bring about the reconstitution of Germany. The period after 1850 was marked by the abandonment of the old oligarchic constitution and the enactment of liberal legislation. Freedom of labor was then completely established for the first time, and the Jews were emancipated. In the War of 1866 Frankfort embraced the cause of Austria. The city was occupied by the Prussians on July 16, and on October 18 it was incorporated with Prussia. On May 10, 1871, the definite treaty of peace, making the end of the Franco-German War, was signed at Frankfort. Consult Bleicher, *Statistische Beschreibung der Stadt Frankfort am Main und ihrer Bevölkerung* (2 parts, Frankfort, 1892, 1895), Wolff and Jung, *Die Baudenkmäler in Frankfurt* (1b, 1895), Stricker, *Neuere Geschichte von Frankfurt seit 1806* (1b, 1874-81), Mentzel, *Frankfurt am Main, ein Stadtebild* (1b, 1898), Kanter, *Die Entwicklung des Handels zu Frankfurt a. M.* (Heidelberg, 1902), Horne, *Geschichte von Frankfurt* (4th ed., 1902-03), Whittingham, *A Brief Discourse of the Troubles at Frankfort, 1554-58* (London, 1907); May, *Le traité de Francfort* (Paris, 1909), which contains a good bibliography, *Veröffentlichungen der historischen Kommission der Stadt Frankfurt am Main* (3 vols., Frankfurt, 1909-11).

FRANKFORT A city and the county seat of Clinton Co., Ind., 48 miles northwest of Indianapolis, on the Chicago, Indianapolis, and Louisville, the Lake Erie and Western, the Vandalia, and the Toledo, St. Louis, and Western railroads (Map Indiana, D 4). It has a Carnegie library and fine courthouse and high-school buildings. The city is in a productive agricultural district, has a kitchen-cabinet plant, and manufactures brick and tile, lumber, butter, flour, brickmaking machinery, agricultural implements, crackers, etc. There are also railway repair shops and large wholesale grocery establishments. The electric-light plant is owned by the municipality. Pop., 1900, 7100, 1910, 8634, 1914 (U. S. est.), 9286; 1920, 11,585.

FRANKFORT. A city, the capital of Kentucky and the county seat of Franklin County, 55 miles by rail east of Louisville, on both sides of the Kentucky River, which is spanned by a suspension bridge 700 feet long, and on the Chesapeake and Ohio, the Louisville and Nashville, and the Frankfort and Cincinnati railroads (Map Kentucky, F 3). The city is situated in the heart of the "Blue Grass" region of the State. On one of the hills near by is the Franklin Cemetery, which ranks with the most beautiful in the South, and in which are buried Daniel Boone and other persons prominent in the history of Kentucky. There are monuments to the soldiers who died in the wars of 1812 and with Mexico. Among the prominent buildings are the State House, the Governor's Mansion, the State Arsenal, the State Penitentiary, the State Home for Feeble-Minded Children, the State Library, and the State Colored Normal School. The river is navigable and, by means of a lock and a dam, furnishes abundant water power. Frankfort carries on a considerable trade and has extensive manufactures of lumber, whisky, flour, chairs, shoes, twine, carriages, tobacco, hemp, glass, etc. The government, under a charter of 1893, is vested in a mayor, elected every four years, and a municipal council, which elects most of the administrative officials not chosen by popular vote. Pop., 1900, 9487, 1910, 10,465, 1914 (U. S. est.), 10,882.

Frankfort was founded in 1786 by Gen. James Wilkinson, who made it the centre of his commercial operations and, for a time, of his Spanish intrigues. In 1792 it became the capital of the State, though in 1797 its population was only 441, of whom 112 were slaves. In the fall of 1862, during the Civil War, Frankfort was occupied by the Confederate General Braxton Bragg (q.v.), and in the presence of the Confederate army and a crowd of citizens, Richard Hawes, the chosen representative of the Confederate faction of the State, was, on October 4, formally inaugurated Governor. The approach of General Buell forced Bragg to evacuate on the same day. In 1900 William Goebel (q.v.), Democratic Governor elect, was assassinated here, and Frankfort was the centre of considerable excitement during the prolonged controversy over the governorship.

FRANKFORT A village in Herkimer Co., N. Y., 10 miles from Utica, on the West Shore Railroad and on the Erie Canal. It contains a public library and the old Gates match factory, one of the first in the United States. The chief industries are the manufacture of road machinery and agricultural implements. The water works and electric-light plant are owned by the village. Pop., 1900, 2664, 1910, 3303.

FRANKFORT, COUNCIL OF An assembly convened at Frankfort-on-the-Main by Charles the Great in 794 and attended by all the bishops and many ecclesiastics of the Frankish Kingdom, Italy, Aquitania, and even by some ecclesiastics from England. Its principal business related to (1) the doctrine of Adoptianism (see **ADOPTIAN CONTROVERSY**), as recently revamped by Elipandus and Felix; and (2) the question of image worship. Adoptianism was condemned, and also the rendering of *Latria* (the worship due to God alone) to images, under the mistaken idea that the second Council of Nicaea had sanctioned it. The canons of the Council have the customary range and touch upon many matters. Consult Mombert, *Charles the Great* (New York, 1888), and Hefele, *Conciliengeschichte* (Freiburg, 1874). The original canons are in Migne, *Patrol Lat.*, xvii. See **CAROLINE BOOKS**.

FRANKFORTER, GEORGE BELL (1860-) An American chemist. He was born at Potter, Ohio, graduated in 1886 from the University of Nebraska, where he was instructor in 1885-87 and professor of chemistry in 1893-94, and also studied at the University of Berlin (Ph.D., 1893). He taught in the high school of Lincoln, Neb. (1887-88), and after 1894 was dean of the School of Chemistry and director of the chemical laboratory of the University of Minnesota. He was United States Mint Commissioner in 1900. He served as vice president of the American Association for the Advancement of Science in 1910. His investigations deal with alkaloids, narcotin, narscin, veratrin, isopyron, vegetable oils, pitch, camphor, eugenol, and resins.

FRANKFORT-ON-THE-ODER, ō'dēr (Ger. *Frankfurt an der Oder*, pron. an dēr ō'dēr) A Prussian city, capital of Frankfurt Government District in the Province of Brandenburg, situated on the left bank of the Oder, 50 miles by rail east-southeast of Berlin (Map Germany, F 2). Included within the city limits are several suburbs, the suburb of Damer being on the right of the Oder. Damer is connected with the old town by a massive bridge about 850 feet long. On the west of the old town are beautiful promenades laid out on the site of the ancient ramparts. Frankfort has a number of fine streets and squares adorned with monuments. Among the older churches are the Evangelical Church of St. Mary, a brick building of the thirteenth century, with wood carvings, stained glass, and a candelabrum 13 feet high, and the Reformed Church, built in the transition style at the beginning of the thirteenth century and recently renovated. The splendid Rathaus, dating 1607, and the municipal theatre, are among the most noteworthy secular buildings. Frankfort has a monument to the poet Ewald von Kleist (q.v.), and an especially fine monument by Unger to Prince Frederick Charles (died 1885). The university, established in 1506, was transferred in 1811 to Breslau. Frankfort has a gymnasium, founded in 1694, a realgymnasium, and a number of other institutions for secondary education. The benevolent institutions include one municipal and four private hospitals and two orphan asylums.

The manufactures of Frankfort include machinery, boilers, and other iron products, glass articles, pottery, musical instruments, chemicals, chocolate, sugar products, paper, leather, etc. There are extensive railway shops. Besides being situated on the navigable Oder, the town is

connected by canal with the Elbe and the Vistula. An electric street railway accommodates local traffic. There are three annual fairs. The town has a large garrison. Pop., 1890, 55,738, 1900, 61,852, including 4134 Roman Catholics and 747 Jews, 1910, 68,230, the area of Frankfort is 60 square kilometers (23 square miles). The position of Frankfort early gave it great commercial importance in the trade with Poland. After receiving municipal rights in 1253 it soon developed into a commercial centre of considerable magnitude. The town suffered in the Thirty Years' War and the Seven Years' War as well as during the Napoleonic wars.

FRANKINCENSE (from OF *franc encens* ML *francum incensum*, pure incense, from *francus*, pure, probably connected with OHG *Franko*, Frank, Lat *Franci*, Franks, AS *franka*, Icel *frakki*, spear + *incensum*, incense, from Lat *incendere*, to burn, from *in*, in + *candere*, to burn). A name employed to designate various resinous substances which diffuse a strong fragrance in burning, and which are on that account used in certain religious services. There is good reason to believe that the frankincense of the Jews, and also of the ancient Greeks and Romans, was chiefly or entirely the substance now known as *olibanum* (q.v.), the product of an Indian tree, *Boswellia serrata* and also *Boswellia carteri*. It was formerly supposed to have been obtained from some species of *Juniperus*, which are generally believed not to yield such a product, the prized frankincense of the ancients was brought from the East. Several trees, such as certain species of *Protium* and of *Croton*, yield substances used as frankincense in place of *olibanum*. The silver fir in Europe furnishes a resinous product which is the common frankincense of the pharmacopoeias. American turpentine is also often sold under this name. It is used in the composition of stimulating plasters, etc. Burgundy pitch is made from it. It is a spontaneous exudation from the tree, hardening by exposure to the air, and is generally of a whitish or pinkish color, with a rather agreeable odor and a balsamic taste. See **BOSWELLIA**, FR.

FRANKING PRIVILEGE The right of sending mail matter free of charge. In England this privilege was secured to members of Parliament at first by warrant of the Postmaster-General and later by statute. It was abolished in 1840. In the United States the privilege was accorded by statute to Revolutionary soldiers in actual service, to various executive officers of the government, as well as to Senators and members of Congress. It was abolished in 1873, but formally restored a few years later, and at present officers of the United States government may send and receive through the mails all public documents without payment of postage, the name and office of the sender being written thereon. This privilege does not extend, however, to those officers who are authorized to make requisitions upon the Postmaster-General for official postage stamps. Seeds and agricultural reports may be mailed free by the Commissioner of Agriculture and by members of Congress. The franking privilege is frequently abused. As no penalty is attached to the improper use of the frank, it has been recommended that a penalty be imposed by act of Congress. Many public officers are allowed to send their official communications in unstamped envelopes marked "official business."

An unlawful use of such an envelope by one not entitled to the franking privilege subjects the offender to a statutory penalty of \$300 See POST OFFICE

FRANKISH VERSION See BIBLE

FRANKL, fran'k'l, LUDWIG AUGUST, RITTER VON HOCHWART (1810-94). An Austrian poet. He was born in Bohemia, of Jewish parentage, and was educated in medicine in Vienna, but preferred journalism and literature. His *Habsburglied* (1832), a series of ballads in chronological order, placed him among the Romanticists. Among his best-known works are *Sagen aus dem Morgenlande* (1834) and the epic *Christoforo Colombo* (1836). In 1856 he established a school in Jerusalem and described the condition of the Orient in *Nach Jerusalem* (1858) and *Aus Aegypten* (1860). Jewish subjects are treated by him in the two poems *Rachel* (7th ed, 1880) and *Der Primator* (1864) and in the historical work *Zur Geschichte der Juden in Wien* (1853). Frankl also took an active interest in the philanthropic work of Vienna and in public affairs, especially in 1848, when the liberal spirit of his poetry made him widely known. His collected works, except his satires, appeared in three volumes in 1880.

FRANKLAND, SIR EDWARD (1825-99). An English chemist, born at Churchtown, near Lancaster. He was a druggist's apprentice in Lancaster in 1840-45 and then worked in Playfair's laboratory in London (with Kolbe), and, after 1847, in Bunsen's laboratory, and in the University of Marburg (with John Tyndall, who had taught with him the year before at Queenwood College, Hampshire). He became professor of chemistry at Owens College, Manchester (1851), lecturer at St Bartholomew's, London (1857), and professor at the Royal Institution (1863), the Royal School of Mines (1865), and the South Kensington School of Science (1881). He was the first to state clearly and definitely (in 1852) the theory of valency in chemistry. In 1853 he described a regenerative gas burner, of the type commonly called by Bowditch's name. With Lockyer, in 1868, he discovered the new element, helium. He was knighted in 1897. He wrote *Water Analysis for Sanitary Purposes* (1880), and for many years after 1865 made monthly reports on the London water supply. His *Experimental Researches in Pure, Applied, and Physical Chemistry* were published in 1877. Consult the *Autobiographical Sketches* (London, 1902).

FRANKLAND, PERCY FARADAY (1858-) An English chemist, son of Sir Edward Frankland. He was born in London and was educated at the University College School, the Royal School of Mines (where he lectured in 1880-88), and the University of Wurzburg. He was professor of chemistry at University College, Dundee (1888-94), at Mason College, Birmingham (1894-1900), and at Birmingham University. Some of his published work is the joint labor of his wife, Grace Coleridge Toynbee (born 1858), daughter of Joseph Toynbee—notably *Micro-Organisms in Water* (1894) and *The Life of Pasteur* (1897).

FRANKLIN. Formerly a district of Canada, formed in 1895, and composed of numerous islands north of the mainland, including Banks, Prince Albert, King William, Baffin, Prince of Wales, Melville, North Devon, Bathurst, and others. The area is estimated at about 500,000 square miles. It is mostly within the Arctic

circle and nearly destitute of animal and vegetable life. The only inhabitants are some Eskimo on Baffin Land. In 1905 it was merged into the new Northwest Territories.

FRANKLIN. A city and the county seat of Johnson Co., Ind., 20 miles south by east of Indianapolis, on the Cleveland, Cincinnati, Chicago, and St. Louis and the Pittsburgh, Cincinnati, Chicago, and St. Louis railroads and the Indianapolis, Columbus, and Southern Traction Co.'s electric line (Map Indiana, E 6). It is the seat of Franklin College (Baptist), opened in 1834, and has a masonic home for widows and orphans, a public library, and fine county buildings. The city is in an agricultural region, its industrial establishments include a desk factory, elevators, flour, planing, and saw mills, and manufacturing of furniture, automobiles, galvanized ware, etc. Pop., 1900, 4005, 1910, 4502.

FRANKLIN. A city and the county seat of Simpson Co., Ky., 53 miles north by east of Nashville, Tenn., on the Louisville and Nashville Railroad (Map Kentucky, D 6). It has the Franklin Female College and the Southern Kentucky Sanatorium. The industrial establishments include flouring mills, a planing mill, a woolen mill, and a tobacco warehouse, etc. The water works are owned by the city. Pop., 1900, 2166, 1910, 3063.

FRANKLIN. A town and the parish seat of St. Mary Parish, La., 101 miles by rail west by south of New Orleans, on Bayou Teche, and on the Southern Pacific Railroad (Map Louisiana, D 4). The bayou is navigable for steamers, and the town carries on a considerable trade in cotton, sugar, fruits, etc. There are several sugar refineries and saw mills. The water works are owned by the town. Pop., 1910, 3857.

FRANKLIN. A town in Norfolk Co., Mass., including the village of Unionville, 28 miles southwest of Boston, on the New York, New Haven, and Hartford Railroad (Map Massachusetts, E 4). It has an almshouse, a public library costing \$250,000, and Dean Academy, an endowed school for both sexes. Its manufactures include pianos, printing presses, straw hats, and cotton, woolen, and felt goods. Franklin was originally a part of Wrentham and was incorporated as a separate township in 1778. The government is administered by town meetings. The water works are owned by the town. Pop., 1900, 5017; 1910, 5641.

FRANKLIN. A city in Merrimack Co., N. H., 19 miles north by west of Concord, at the confluence of the Pemigewasset and Winnepesaukee rivers, which here unite in the Merrimack, and on the Boston and Maine Railroad (Map New Hampshire, F 6). Abundant water power has contributed materially to the city's industrial importance. There are paper and pulp mills, hosiery mills, foundries, and manufactures of needles, knitting machines, woolen goods, boxes, hack saws, lumber, house finish, etc. Franklin is famous as the birthplace of Daniel Webster and contains the New Hampshire Orphan's Home, a public library, and a city hospital. It was incorporated as a town in 1828 and in 1895 received a city charter, now in operation, which provides for a mayor, elected annually, and a council of nine members. The city owns and operates its water works. Pop., 1890, 4085, 1900, 5846, 1910, 6132.

FRANKLIN. A village in Warren Co., Ohio, 16 miles south of Dayton, on the Cincinnati Northern, the Cleveland, Cincinnati, Chi-

cago, and St. Louis, and the Ohio Electric railroads, and on the Big Miami River (Map Ohio, B 6) Paper mills comprise the leading industry. The water works are owned by the village. Pop., 1900, 2724, 1910, 2659.

FRANKLIN. A city and the county seat of Venango Co., Pa., 125 miles by rail north by east of Pittsburgh, on the Allegheny River, and on the Pennsylvania, the Erie, the Lake Erie, Franklin, and Clarion, and the Lake Shore and Michigan Southern railroads (Map Pennsylvania, B 3). It has a public library, the Charles Miller Night School, and two fine parks, besides several places of historic interest. The centre of the great oil region of the State, Franklin's chief interest is in oil, though there are also flouring mills, machine shops, brickworks, and manufactures of steel castings, tools, manifold papers, and oil-well supplies. Franklin was settled about 1753 and was incorporated in 1795. It adopted the commission form of government in 1913. The water works are owned by the city. Pop., 1900, 7317, 1910, 9767, 1914 (U. S. est.), 10,811.

FRANKLIN. A city and the county seat of Williamson Co., Tenn., 20 miles south by west of Nashville, on the Harpeth River, and on the Middle Tennessee and Louisville and Nashville railroads (Map Tennessee, D 3). It is the seat of the Tennessee Female College, opened in 1856, and the Battle Ground Academy, opened in 1902. A Confederate cemetery and Fort Granger are situated here. The town is the centre of a fertile agricultural region and has manufactures of carriages, flour, lumber, mantels, etc. Pop., 1900, 2180, 1910, 2924. An engagement between the Federal General Granger and the Confederate General Van Dorn occurred here on April 10, 1863, the latter making the attack and being repulsed; and here, on Nov. 30, 1864, was fought the battle of Franklin. See **FRANKLIN, BATTLE OF**.

FRANKLIN (from ML *franchulanus*, from *franchus*, free). An English freeholder of former times, who held his lands of the crown free from any feudal servitude to a subject superior. He is one of the characters described by Chaucer. In the course of time he lost his dignity, becoming a well-to-do yeoman. Consult Chaucer, *Prologue to the Canterbury Tales*, Shakespeare, *Henry IV, Part I* (Act II, Scene 1), and *Winter's Tale* (Act V, Scene 2).

FRANKLIN, BATTLE OF. A sanguinary battle fought at Franklin, Tenn., on Nov. 30, 1864, between a Federal army of about 25,000, under General Schofield, and a Confederate army of about 40,000, under General Hood. Early in November, 1864, General Schofield, acting under orders from Thomas, took command at Pulaski, Tenn., of a Federal force of about 25,000. On the 21st Hood advanced against this position, and Schofield gradually withdrew before him towards Nashville, under instructions to impede the Confederates until Thomas should have fully prepared himself for action. Confederate movements by the rear and by the right flank were balked by Schofield at Columbia and Spring Hill on the 24th and the 29th respectively and by a rapid night's march, in which he passed by the sleeping Confederate army. Schofield reached Franklin at dawn of the 30th and, in the absence of pontoon bridges, immediately set about improvising bridges for transferring his army and stores across the Harpeth River. He also threw up breastworks on the left bank to

meet a possible Confederate attack and stationed General Wagner, with two brigades, somewhat in advance, with instructions to withdraw behind the intrenchment on the approach of the Confederates, without awaiting a general attack. Meanwhile Hood, chagrined over the previous day's failure at Spring Hill, had come up and at 4 P. M. ordered an attack. Wagner, impudently delaying, lost heavily, and his men, enveloped by the Confederate advance, hastily retreated through the Federal centre, which was soon thrown into great confusion. General Ord, without orders, threw his brigade into the resulting gap and thus, by enabling the Federals to reform, saved the day. Thereafter until almost midnight the fighting continued, the Confederates making repeated and desperate assaults only to be beaten back each time with disproportionate loss by the Federals, under the immediate command of Gen. J. D. Cox, General Schofield being on the right bank of the river. During the night Schofield withdrew unmolested to Nashville, where he joined Thomas. The battle is notable for the remarkable gallantry of the Confederates and the stubborn bravery of the Federals. The Federal loss in killed, wounded, and missing was 2326, that of the Confederates, though not accurately known, probably exceeded 6000. Consult Cox, *The Battle of Franklin* (New York, 1897), id., *The March to the Sea, Franklin and Nashville* (ib., 1882), Johnson and Buel, *The Battles and Leaders of the Civil War*, vol. IV (ib., 1887), Nicolay and Hay, *Abraham Lincoln: A History*, vol. X (ib., 1890), Steele, *American Campaigns* (Washington, 1909).

FRANKLIN, BENJAMIN (1706-90). An American statesman, scientist, and author. He was born in Boston, Mass., Jan. 17, 1706. His father, Josiah Franklin, emigrated to America about 1685 and took up the business of tallow chandler. His mother, a second wife, was the daughter of Peter Folger, a leading settler, noted for his philanthropy and tolerance. Benjamin, the fifteenth of 17 children, was named after his father's favorite brother and, as the tenth son, was intended as the "tithe for the ministry." Either on account of poverty or an early perceived distaste on the boy's part, the theological idea was given up. After a year or more at candle making in his father's shop, Benjamin was apprenticed to his brother James, a printer, and the founder in 1721 of the *New England Courant*, one of the earliest papers in America. While in this office Franklin learned the trade well, read diligently, and found time to write pieces in the style of the *Spectator*, and even ballads, which he had published in the *Courant*, at first anonymously. In 1722, for some political opinions, James Franklin was imprisoned a month and forbidden to publish his paper. For a while it appeared under Benjamin's name, but there was continual quarreling between the two brothers. At last the apprentice broke his indentures and slipped away by sea to New York. Finding no work there, he went on to Philadelphia, where he arrived, October, 1723, friendless and almost penniless. Though only 17 years old, he was a good printer and of pleasing address and quickly found friends, and began to work for Samuel Keimer, a printer recently emigrated from London. In 1724 Sir William Keith, the Governor, induced him to go to England to buy type for a printing shop of his own, promising him a letter which would

give him aid in the way of money. Franklin reached England, found his patron's promises worthless, and had to shift for himself. For a year and a half he maintained himself as a printer, gaining some notoriety by a free-thinking pamphlet which he printed, but afterward repudiated as immature. He also got considerable reputation in London for his prowess as a swimmer. Returning to Philadelphia in October, 1726, he was clerk for a while in a newly started dry-goods shop. He soon got back to printing, however, first with his old employer, Keimer, and then in an independent shop for which he furnished skill and energy and his partner, Hugh Meredith, the money. In 1729 Franklin got control of the *Pennsylvania Gazette*, which Keimer had started, and the excellence of the printing and the spirit of the writing won him a competence and high consideration throughout the Colonies. On the dissolution of the partnership in 1730 Franklin took over the business. In 1730 he married Miss Deborah Read, the daughter of the man whom he had lodged with on his first coming to Philadelphia. From this time on he was engaged almost constantly in some sort of public activity, and his achievements were varied. In 1731 he began the Philadelphia Library, chartered in 1742, said to be the first and the model of the American system. *Poor Richard's Almanac* he first published in 1732, under the pseudonym of "Richard Saunders," and for 25 years his witty, worldly-wise sayings in this publication were very influential in molding the new American character. In 1736 he became clerk of the General Assembly, and the next year was appointed postmaster for Philadelphia. About this time he also organized for the city a police force and a fire company. In 1743 he broached a plan for an academy, which was later adopted and developed into the University of Pennsylvania.

Soon after his return from England he started a debating society for the "Discussion of Morals, Politics, and Natural Philosophy." This society in 1743 developed into the American Philosophical Society. Always interested in scientific studies, he invented an "open stove for better warming of rooms," a stove which is still in use both in this country and in Europe. While in Boston in 1746 he met a Dr. Spence, who had lately arrived from Scotland, and saw him perform a few electrical experiments, which interested him greatly. The next year the Library Company of Philadelphia received from Mr. Peter Collinson of London a glass tube with directions for performing electrical experiments. Franklin at once began his scientific investigations, and practically all his work was done between this time and his departure for England in 1757. His important papers took the form of letters to Mr. Collinson and to a Mr. Kinnersley, who had been associated with him in his early experiments, but later moved to Boston. Franklin's first original experiments were with the action of fine points with reference to electrical charges, a matter which he explained fully. He next discussed the theory of the Leyden jar and gave his explanation in words which are practically satisfactory to-day. He became convinced, as others had before, that lightning was an electrical phenomenon and immediately proposed a method for testing the matter. His plan was published in London and was carried out in France and in England before he himself performed his famous kite experiment. He pro-

posed the construction of lightning rods having sharp points for the protection of houses. He was deeply interested in the meaning of the two kinds of electricity, positive and negative, and offered as his explanation what is called the "one-fluid theory." It is interesting to note that this theory comes nearer to our present conceptions of electricity than any of the other theories advanced in the past. This theory in brief is as follows. Every unelectrified body is supposed to contain its normal quantity of "electrical fluid"; a body is positively electrified when it contains an excess of this, and negatively electrified when it has lost a part of its normal quantity.

The extraordinarily widespread interest in the work of Franklin was a natural consequence of the clearness of his writing, for in this respect he was in marked contrast to most of his contemporaries. Franklin's scientific views won their way through surprised incredulity into acceptance both in France and England. Honorary degrees were voted to him by St. Andrews, 1759, and by Oxford, 1762, the freedom of the city of Edinburgh was given him in 1759, and he became FRS and was awarded the Copley gold medal in 1775.

In 1753 Franklin was appointed Postmaster-General for the Colonies. In 1754 he was commissioner from Pennsylvania at the Intercolonial Congress which met at Albany to take measures in view of the threatened French and Indian War, and he proposed a plan combining local independence with union. (See ALBANY CONVENTION.) It seems probable that if this plan had been followed many of the causes which led to the Revolution would have been avoided, and perhaps the Revolution itself. When the French and Indian War came on, Franklin assisted Braddock greatly, giving his personal security for supplies and transportation furnished by the Pennsylvania farmers. The descendants of William Penn, the proprietors of the Colony, refused to allow their private lands to be taxed for the support of the English troops, and in 1757 Franklin was sent to England to petition the crown against this. This mission conducted satisfactorily, he remained in England as the leading representative for the Colonies. In 1766 occurred his famous examination before the House of Commons as to the effects of the Stamp Act, and his influence helped to secure the repeal of the act, but he did not fully appreciate the depth of the feeling in America in regard to taxation, and when he urged the colonists to pay the later small tax on tea, he was roundly charged with lack of patriotism. In 1774 the publication of the so-called Hutchinson letters, which he had been intrusted with, and which it was to the interest of the Tory party not to have published, made him unpopular in England. In 1775, seeing war to be inevitable, he returned and was immediately chosen a delegate to Congress. He was on the committee to draft the Declaration of Independence and was one of the signers.

During the Revolutionary War Franklin represented American interests in Europe and particularly in France to which he was appointed a commissioner in September, 1776. His scientific reputation, his dignity of character, and his charm of manner made him extremely popular in French literary, social, and political circles, and his wisdom and fertility of resource secured for the government aid and concessions which no

other man could possibly have obtained. He lent efficient aid to the operations of the American navy and especially of John Paul Jones. Against the vigorous opposition of Necker, his matchless diplomacy got for a country that was bankrupt and almost hopeless loans amounting to many millions of francs. After the defeat of Burgoyne Franklin was received officially, and on Feb. 6, 1778, he concluded a treaty of offensive and defensive alliance with France. On Nov. 30, 1782, he signed the preliminary articles of peace, and the next year (Sept. 3, 1783) he was one of the signers of the definitive Treaty of Paris.

In September, 1785, his request to be allowed to return home was granted by Congress, but he had scarcely reached Philadelphia before he was chosen a member of the Executive Council, and soon afterward (October, 1785–October, 1788) he held the position which now corresponds to the governorship. In May, 1787, he was a member of the convention to form a national constitution, and in spite of his advanced age was vigorously active in the proceedings. He was deeply interested in all schemes of usefulness and philanthropy, and one of his last public acts was to sign a memorial to Congress, Feb. 12, 1790, as president of the Pennsylvania Society for the Abolition of Slavery. The last two years of his life were spent in severe pain of body, but in activity of mind. He died April 17, 1790. His grave is in the churchyard at Fifth and Arch streets, Philadelphia. Upon his death Congress passed resolutions of mourning, and the National Assembly of France, on the motion of Mirabeau, put on mourning for three days.

Franklin's greatest service to America was undoubtedly due to his skill in diplomacy. His public spirit and devotion were reinforced by powers of mind and wisdom that made him practically unrivaled. To his common sense, sagacity, and industry he added great firmness of purpose, a matchless tact, and a broad tolerance. In science, his electrical discoveries, with the invention of the lightning rod, are very important, and, besides these, many other discoveries and inventions are to be credited to him. His literary reputation rests chiefly on his unfinished *Autobiography*, a book which is an epitome of his life and character, expressed in wonderfully clear and simple style. This famous book had a singular fortune. Franklin's grandson tried to edit it to suit his own taste, which was less frank than Benjamin's. He published what pretended to be a correct version in London, 1817, but a French version, from another manuscript, had appeared in 1791. In 1867 John Bigelow secured in France the original manuscript, which Temple Franklin had disposed of. The correct version of the *Autobiography* then appeared in 1868. Franklin's newspaper and his almanac were the organs through which he spread his practical morality and wisdom, and they and his letters reflect his distinctively American humor. He was never deliberately an author, all his writing was done with a practical aim and derives its value largely from the accuracy with which it reflects his character. He was remarkably deficient in poetic imagination and in ability to appreciate the spiritual side of man's nature. For a while during his youth he was a skeptic, and he was never an orthodox Christian, but his attitude when he died was such that to-day he would be classed with the "liberal Christians."

In person Franklin was about 5 feet, 9 or 10 inches in height and well built. His complexion was fair, his eyes gray, and his manners extremely affable and winning. None of his descendants bear his name, though there are many descendants of his daughter, Miss Bache.

FRANKLIN, EDWARD CURTIS (1862–). An American chemist, born at Geary City, Kans. In 1888 he graduated at the University of Kansas, where he served as an assistant in 1888–93, associate professor in 1893–99, and professor of physical chemistry from 1899 to 1903, and he also studied at the University of Berlin and at Johns Hopkins (Ph.D., 1894). At Leland Stanford Junior University he was associate professor in 1903–06 and professor of organic chemistry after 1906. In 1911–13 he was professor of chemistry and chief of the division of chemistry of the United States Public Health and Marine Hospital Service, he served on the United States Assay Commission in 1906, and published papers on liquid ammonia as an electrolytic solvent, on the ammonia system of acids, bases, and salts, and on nonaqueous solvents.

FRANKLIN, SIR JOHN (1786–1847). An Arctic explorer, born at Spilsby, Lincolnshire, England. His father had intended him for the church, but, giving way to the boy's strong desire to follow the sea, secured for him a midshipman's appointment in the navy in 1800. He was first attached to the *Polyphemus*, with which he served in the Baltic, and took part in the battle of Copenhagen, April 2, 1801. His next service was with the *Investigator*, which, under command of Capt. Matthew Flinders, was sent to survey the Australian coast. Returning to England, he was assigned as signal officer to the ship of the line *Bellerophon*, in which, in 1805, he participated in the battle of Trafalgar. In 1808 he became a lieutenant and in 1814 accompanied the British expedition against New Orleans, in the attack upon which he was wounded. Franklin's career as an Arctic explorer began in 1818, with his appointment to the command of the *Trent*, a brig that had been fitted out to accompany Captain Buchan in the *Dorothea* to sail to the north of Spitzbergen and cross the Polar Sea by that route. The at-

tempt proved a failure, but Franklin's scientific knowledge and enthusiastic interest in Polar explorations became known, and in the following year he was placed in command of an expedition which was destined to explore the northern coast of the continent eastward from the Coppermine River, acting in conjunction, if possible, with Lieutenant Parry, who was dispatched with two vessels to Lancaster Sound. Wintering at Fort Enterprise, Franklin in the summer of 1821, by a journey of 900 miles, traced the continental coast of North America from the mouth of the Coppermine eastward to Point Turnagain ($190^{\circ} 15' W$), from which place he turned westward the same day that Parry, unsuccessful, sailed from Repulse Bay for England. Franklin was forced to return across the Bad Lands under such adverse conditions as fully tested his masterful and resolute personality. Of his party of 20, 10 perished—two by violence and eight by cold, hunger, and exhaustion. On his return to England he was promoted to the rank of captain and was elected a fellow of the Royal Society. In 1825 Franklin led an expedition which attempted, via the Mackenzie River, to reach the northwest extremity of the continent, and by surveying the coast between the Mackenzie and Coppermine fell in the unknown parts of the continental coast. Wintering at Fort Franklin, the party reached the Mackenzie delta July 3, 1826. Dr. Richardson successfully surveyed the coasts to the east, discovering Wollaston Land. Franklin went to the west to connect his survey with Beechey in Bering Strait, but bad ice made success impossible. Franklin turned back, August 16, from Return Reef ($148^{\circ} 52' W$), 160 miles east of Point Barrow. The magnitude and extent of the discoveries of Franklin's two expeditions are shown by the statement that of the 72° of longitude of the unknown coast he had explored more than 40° . He returned to England in September, 1827. In 1829 he was knighted, and in recognition of his services to geographical science received the honorary degree of DCL from Oxford and the gold medal of the Geographical Society of Paris. From 1830 to 1833 Franklin commanded the *Rainbow* frigate on the Mediterranean station and won the appreciation of the Greeks and a decoration from King Otho for services rendered them during their war of liberation. From 1836 to 1843 Sir John was Lieutenant Governor of Van Diemen's Land, now Tasmania, and the period of his administration was one of the greatest progress the colony had ever known. On his return to England he found that an expedition was being planned by the Admiralty to make another attempt to discover the Northwest passage. While Sir John would not solicit the command, he promptly accepted it when offered. It consisted of the *Erebus* and *Terror*, with 129 officers and men, and left England on May 18, 1845, with the intention of sailing direct to Cape Walker and thence southward and westward in the direction of Bering Strait, as far as the ice and land would permit. The ships were last seen on July 26, 1845, by a Scottish whaler in Baffin Bay. The winter of 1847-48 passed without news from the expedition, and in the spring of 1848 began a remarkable series of relief and search expeditions from both England and the United States, numbering 39 all told up to 1857 and involving an expenditure of over a million pounds sterling. On Aug. 27, 1851, Captain Penny found on Beechey Island

the graves of three of Franklin's sailors who had died in 1846, this was the first definite information of the expedition. In April, 1854, while exploring Melville Peninsula for the Hudson's Bay Company, Dr. John Rae learned from the Eskimos of Boothia Land that Franklin's ships had been abandoned in 1850, the report being confirmed by numerous relics (Franklin's silver) obtained from the natives. It was not until 1859 that the expedition sent out in 1857 by Lady Jane Franklin (1792-1875), under Captain McClintock, in the *Fox*, decided the fate of Sir John and his comrades and at the same time established the fact that he had actually achieved what he had set out for, the discovery of the long-sought Northwest passage. From the brief record found by Hobson of McClintock's party it was learned that, after ascending Wellington Channel, which separates North Devon and Cornwallis Island to lat $77^{\circ} N$, and returning by the west side of Cornwallis Island, the ships had wintered, in 1845-46, at Beechey Island, on the southwest coast of North Devon (in lat $74^{\circ} 43' 28'' N$), that in the fall of 1846 an attempt had been made to reach the North American coast by sailing through the channel which separates Prince of Wales and North Somerset Islands, but that progress had been arrested by heavy ice when within 12 miles of the north end of King William's Land, where the party remained all winter, and where on June 11, 1847, Sir John Franklin had died, and that the ships were abandoned there by Captain Crozier and the 105 survivors of the party, who on April 26, 1848, started southward over the ice for the Great Fish River, on the continent. There are grounds for the belief that 79 perished on the journey, and that the remaining 29 died of starvation near Montreal Island. Franklin was promoted to be rear admiral in 1852, five years after his death. Sir John Franklin published the results of his first two Polar expeditions under the titles *Narrative of a Journey to the Shores of the Polar Sea in the Years 1819-22* (1823) and *Narrative of a Second Expedition to the Shores of the Polar Sea in 1825-27* (with Dr. Richardson) (1828). (Consult also McClintock, *Narrative of the Fate of Sir John Franklin* (Boston, 1860), Osborn, *The Career, Last Voyage and Fate of Sir John Franklin* (London, 1860), Beesly, *Sir John Franklin* (ib, 1881), Markham, *The Life of Sir John Franklin, and the Northwest Passage* (ib, 1891), Traill, *Life of Sir John Franklin* (ib, 1896).)

FRANKLIN, SAMUEL RHODES (1825-1909)

An American naval officer, brother of Gen. W. B. Franklin. He was born in York, Pa., entered the United States navy as an acting midshipman in 1841, participated in the capture of Monterey, Cal., during the Mexican War, was assistant professor of ethics and English at the United States Naval Academy in 1854, and in September, 1855, became a lieutenant. He became lieutenant commander in July, 1862, served in the Western Gulf Blockading squadron in 1863, and as assistant to Commodore Palmer at New Orleans in 1863-64, and in the spring of 1865 was on the staff of Acting Rear Admiral Thatcher in Mobile Bay. In 1873 he was promoted to be captain. He was chief of staff to Admirals Case and Worden; served for a time in the European squadron, was president of the board of examiners for the promotion of officers in 1877, was hydrographer to the Bureau of

Navigation from 1877 to 1880; became a commodore in May, 1881, was superintendent of the Naval Observatory in 1884-85, was promoted to be rear admiral in January, 1885, and commanded the European station from 1885 to 1887, when he retired. In 1889 he was president of the International Marine Conference. He published *Memories of a Rear-Admiral* (New York, 1898).

FRANKLIN, STATE OF See TENNESSEE, NORTH CAROLINA

FRANKLIN, WILLIAM (1729-1813) A Colonial governor of New Jersey. He was born in Philadelphia and was a natural son (probably by Barbara, a domestic) of Benjamin Franklin, who acknowledged him and brought him up in his household. During King George's War William served in the Pennsylvania line on the Canadian frontier and became a captain before he was of age. In 1754-56 he was comptroller of the general post office and for a time was clerk of the provincial assembly. Going with his father to England, he was there admitted to the bar (1758) and in 1762 was appointed Governor of New Jersey, where his time-serving character and his shift from the Whig to the Tory party disgusted the colonists. During the Revolutionary War he remained loyal to England and was kept under surveillance by the patriots. He gave his word that he would not leave the province, but in consequence of summoning a meeting of the old Colonial assembly, he was arrested and sent to Connecticut and kept a prisoner for two years. In November, 1778, he was exchanged and took refuge in New York. In 1782 he went to England, where he died. His political course caused an estrangement between him and his father, though they were partially reconciled in 1784. All his lands in Nova Scotia Dr. Franklin left to William. It was for William that his father began in 1771 his *Autobiography*. His son lost the manuscript during the war, and it was found by a friend, who urged the father to continue it. William's son, William Temple Franklin, edited Benjamin Franklin's works. Consult F. B. Lee, *New Jersey as a Colony and as a State* (4 vols., New York, 1902), E. J. Fisher, *New Jersey as a Royal Province, 1738-76* (ib., 1911), *Letters from William Franklin to William Strahan*, ed. by Hart (Philadelphia, 1912).

FRANKLIN, WILLIAM BUEL (1823-1903). An American soldier. He was born at York, Pa., graduated at West Point in 1843 (first in the class in which Grant's rank was twenty-first), and for three years was engaged in topographical work. In the Mexican War he accompanied General Wood on his march through Coahuila. He was assistant professor of natural and experimental philosophy at West Point from 1848 to 1852, and thereafter was on various engineering works, becoming chief of the Construction Bureau of the Treasury Department in March, 1861. On May 17, 1861, he was promoted brigadier general of volunteers, in which capacity he served in the first battle of Bull Run and commanded successively a division and the Sixth Army Corps of the Army of the Potomac in the Peninsular campaign under General McClellan. On June 30, 1862, he was brevetted brigadier general in the regular service and on July 4 was promoted major general of volunteers. He commanded the Sixth Corps of the Army of the Potomac in the Maryland campaign, being in command in the battle

of Crampton's Gap, and participating in the battle of Antietam, and commanded the left grand division of the Army of the Potomac in the Rappahannock campaign, participating as such in the battle of Fredericksburg, where an accusation (apparently ill founded) of disobeying Buinside's orders caused his temporary relief from active service. In 1864 he served in the Department of the Gulf, where for some months he commanded the Nineteenth Army Corps and the troops in western Louisiana, and on April 8 was wounded at Sabine Cross Roads. In 1863 Governor Curtin of Pennsylvania, in an effort to escape a renomination, attempted unsuccessfully to secure General Franklin's nomination for that office. From December, 1864, to November, 1865, he was president of the board for retiring disabled officers, at Wilmington, Del. On March 13, 1865, he was brevetted major general in the regular army. He resigned from the volunteer service on Nov. 10, 1865, and from the regular army on March 15, 1866. He became vice president of the Colt's Firearms Manufacturing Company at Hartford, Conn., in November, 1865, was president of the board of managers of the National Home for Disabled Volunteer Soldiers from 1880 to 1890, and in 1889 was commissioner general of the United States to the Paris Exposition. Consult Greene, *Franklin and the Left Wing at Fredericksburg* (Hartford, 1900).

FRANKLIN, WILLIAM SUDDARDS (1863-) An American physicist and electrical engineer, born at Geary City, Kans. He graduated at the University of Kansas in 1887. After further studies in Germany and at Harvard University he was appointed assistant professor of physics at the University of Kansas (1887). From 1892 to 1897 he was professor of physics and electrical engineering at Iowa State College, and in 1897 he was appointed to the corresponding chair at Lehigh University. In 1903 he became professor of physics. He is joint author of *The Elements of Alternating Currents* (1899, 2d ed., 1901), *Elements of Electrical Engineering* (2 vols., 1906), *Dynamo Laboratory Manual* (1906), *The Elements of Mechanics* (1907), *Dynamos and Motors* (1909), and is sole author of *Electric Lighting and Miscellaneous Applications of Electricity* (1912), and a volume of essays, *Bull's School and Mine* (1913).

FRANKLIN AND MARSHALL COLLEGE An educational institution under the care of the Reformed church, established by the union of Franklin College and Marshall College. Franklin College was organized at Lancaster, Pa., in 1787, and named in honor of Benjamin Franklin, one of its benefactors. Marshall College, named after John Marshall, was established by the Reformed church at Mercersburg, Pa., in 1836, in connection with its theological seminary. In 1852 the two institutions were consolidated at Lancaster under a new charter. A preparatory academy is affiliated with the college. The value of the college buildings and grounds is estimated at \$476,375, the endowment is \$428,604, and the annual income \$40,000. Degrees are conferred in the arts. In 1914 the students numbered 568, of whom 250 were in the preparatory department. Consult Dubbs, *History of Franklin and Marshall College* (Lancaster, Pa., 1903). The president in 1914 was H. H. Apple, D.D., LL.D.

FRANKLIN COLLEGE. An educational institution founded by the Baptists at Franklin,

Ind., in 1834 The college offers courses in letters, science, and the humanities, leading to appropriate degrees A preparatory school formerly a part of the institution was discontinued in 1907 The student enrollment in 1914 was 207, and the faculty numbered 16 The total value of the college property was in 1914 over \$500,000, of which considerably more than one-half represents productive funds The institution is on the Carnegie Foundation The library contains about 20,000 volumes The president in 1914 was Elijah D Hanley, D D

FRANKLIN INSTITUTE, THE, OF THE STATE OF PENNSYLVANIA FOR THE PROMOTION OF THE MECHANIC ARTS A learned institution at Philadelphia, Pa., established in 1824 for the purpose of disseminating knowledge of the arts and sciences, and combining in one organization features of the mechanics' institutes and of the exclusive scientific societies The objects of the institute are attained by means of lectures, reports, a journal, libraries, exhibitions, and school instruction The lectures, originally giving systematic courses of instruction, now have the object of presenting the latest advances in art and sciences, in the form of popular lectures and of strictly technical discussions before the sections into which the institute is divided In 1834 a volunteer committee was formed to examine and report on new machines, inventions, and discoveries, the committee consists of 60 members, whose labors have given a notable reputation to the institute The publication of a journal was begun in 1826 and has continued uninterruptedly it is issued monthly and contains the record of the institute's work and contributions relating to the growth of science and American industries The library, devoted exclusively to science and the useful arts, contains (1914) about 64,169 volumes, 48,000 pamphlets, besides maps, charts, and photographs, and has important collections of American, British, French, German, Swiss, Russian, and Austrian patent records, also complete series of reports on public works In 1824 the institute held the first exhibition of American manufactures and has since held 29 exhibitions, the last in 1899 It grants medals, premiums, and certificates for notable inventions A school of mechanical and architectural drawing was established in 1824 and is still maintained, there are also night schools of machine design and naval architecture A school for instruction in English and ancient and modern languages was established in 1826 and became the model on which the Central High School of the City of Philadelphia was founded It was abandoned when the public high schools were established Membership in the institute is open to all persons of legal age on payment of yearly dues Its building is situated at 15 South Seventh Street Consult W. H. Wahl, *Franklin Institute A Sketch of its Organization and History* (Philadelphia, 1895)

FRANK'LINITE. An iron-black, slightly magnetic mineral with a metallic lustre, consisting of ferric and manganic oxides in combination with ferrous, manganeous, and zinc oxides, of rather complex composition and varying relative quantities. It crystallizes in the isometric system, occurring chiefly in octahedral crystals as well as in rounded grains and in compact masses In Germany it is also found in the form of cubic crystals Its principal occurrence in the United States is in Sussex Co., N. J., at

Franklin Furnace, Mine Hill, and at Sterling Hill, being found in veins of limestone in zinc mines Owing to the manganese that it contains, it is used as an ore for making Bessemer steel

FRANKLIN'S TALE, THE One of Chaucer's *Canterbury Tales* It narrates the adventures of the faithful Doogen, as they are recounted in Boccaccio's *Decameron*, in the fifth story of the tenth day, although the franklin claims his story is taken from a Breton lay The narrator himself is a jolly open-handed escheur and knight of the shire

FRANK'MARRIAGE (*liberum maritagium*) A species of estate tail existing by the common law of England It arose where a man, on the marriage of his daughter or other female relative, gave lands to the bridegroom, with a provision limiting the inheritance to the issue of the marriage It was, therefore, a form of fee tail special This tenure was called *liberum maritagium*, to distinguish it from other species of estate tail Four things were necessary to a gift in frankmarriage (1) that it be in consideration of a marriage, (2) that the woman with whom it is given be of the blood of the donor, (3) that the donees should hold of the donor (hence a gift in frankmarriage by a subject became impossible after the Statute *quia emptores*), (4) that the donees should hold for four generations Therefore a reservation of a remainder to a stranger to take effect within four generations was a void limitation upon a gift in frankmarriage The estate has long been obsolete

FRANK'PLEDGE. An ancient principle of English law, prevailing before the Norman Conquest, whereby the members of every tithing or community of freemen were responsible for the good conduct of each other This responsibility consisted in every 10 men in a village being answerable each for the others, so that, if one committed an offense, the other nine were liable for his appearance to make reparation Should the offender abscond, the tithing, if unable to clear themselves from participation in the crime, were compelled to make good the penalty This law has been ascribed to Alfred the Great, but it would appear to have been in existence at a much earlier period Mr Hallam observes "The peculiar system of frankpledges seems to have passed through the following very gradual stages At first an accused person was bound to find bail for standing his trial At a subsequent period his relations were called upon to become securities for payment of the compensation and other fines to which he was liable, they were even subject to be imprisoned until payment was made, and this imprisonment was commutable for a certain sum in money The next usage was to make people already convicted, or of suspicious repute, give securities for their good behavior It is not till the reign of Edgar that we find the first general law, which places every man in the condition of the guilty or suspected, and compels him to find a surety who shall be responsible for his appearance when judicially summoned. This is perpetually repeated and enforced in later statutes during his reign and that of Ethelred Finally, the laws of Canute declare the necessity of belonging to some hundred and tithing, as well as of providing sureties" (*Middle Ages*, ii, 80.)

The court of frankpledge, or court leet, was a court of record held once in the year, within a particular hundred, lordship, or manor, before

the steward of the leet. The business of this court was to present by jury all crimes committed within their jurisdiction and to punish all trivial misdemeanors. This court has practically fallen into desuetude, and the business is discharged by the justices of the peace at general and petty sessions. Originally the business of the court of frankpledge was confined to taking securities or free pledges for every person within the jurisdiction, but this practice having fallen into disuse, the court gradually acquired a criminal jurisdiction concurrent with that of the sheriff's tourn. See COURT BARON, COURT LEET, MANOR.

FRANKS, THE The name borne by a confederation of Germanic tribes which appeared on the lower and middle Rhine in the third century after Christ and subsequently overthrew the Roman power in Gaul. The name is first encountered about the year 240. Many attempts have been made to identify them with earlier tribes, but there is no foundation for the surmises which have been accepted as facts. As early as the beginning of the fourth century they had established themselves in what is now Brabant. Quite early they became separated into two distinct groups—the Salian Franks, who dwelt on the lower stretches of the Rhine and its affluents, and whose name was formerly supposed to have been derived from the river Yssel or Saal, but is now connected by some with their home on the seashore, and the Riparian Franks or Riparii, whose territories lay on both banks of the Rhine along its middle course. The Salian Franks were defeated by Julian in 358 and became allies of the Romans, who intrusted to them the defense of the border. During the first decade of the fifth century the Salian Franks, carried away by the onrush of the other Germanic nations into Gaul, turned upon the Roman provinces, captured Treves, and soon became the masters of a large extent of territory on the Meuse and the Scheldt, acknowledging, however, the suzerainty of the Romans. They fought under Aetius against Attila on the Catalaunian Fields, in 451, and remained on friendly terms with the Romans till after the fall of the Western Empire.

The real greatness of the Franks dates from the Salian Clovis or Chlodwig (481–511), a descendant of the fabled Meroveus, who in 486 overthrew the Roman patrician Syagrius at Nogent, near Soissons, and 10 years later vanquished the powerful confederacy of the Alemanni. The Burgundians, the Visigoths of Aquitaine, and the Riparian Franks were likewise subjugated, and the limits of the Frankish kingdom were extended from the Pyrenees to Friesland and from the Atlantic to the Main. Under the influence of his wife, Clotilda, Clovis had accepted Athanasian Christianity in 496, and in his campaigns against the Arian Goths and Burgundians he acted in part as the champion of orthodoxy, thus marking the beginning of the close connection between the Frankish monarchy and the Roman Catholic church. After the death of Clovis the kingdom was divided among his four sons. Theodoric ruled at Metz, Chlodomer at Orléans, Childebert at Paris, and Clotair at Soissons. Thuringia, Burgundy, and Provence were acquired before 558, in which year Clotair became sole ruler of all the Frankish lands. After Clotair's death, in 561, the kingdom was again divided among his four sons. Austrasia, with a population

predominantly Germanic, fell to Sigebert, who made his capital at Metz, Neustria, comprising part of the Gallo-Roman provinces, was assigned to Chilperic, with his capital at Soissons, Aquitaine fell to Charibert, Burgundy, with its capital at Orléans, was ruled by Guntram. In 567 Charibert died, and his dominions were divided among his brothers. The period that follows is one of internecine strife among the descendants of Meroveus, marked by the foulest crimes and excesses and resulting in the decay of the Merovingian power. In the prevailing anarchy the great nobles who had been intrusted with the government of the provinces seized the opportunity to make themselves virtually independent and their offices hereditary. (See BRUNHILDA, FREDEGUNDA, MEROVINGIANS.) Clotair II in 613 once more reunited the lands of the Frankish crown, but the kings from this time ceased to exercise any influence, and the real power passed into the hands of the great officers of state—the chamberlain, the keeper of the seal, and chief of all the mayor of the palace (*mayor domus*). This office existed in all three of the Frankish kingdoms, but it was in Austrasia that a powerful family arose which held exclusive possession of the mayoralty for more than 100 years, ruling as monarchs in fact, if not in appearance. This was the race of the Carolingians (qv). Pepin of Landen was *mayor domus* of Austrasia under Dagobert I (628–638) and was succeeded by his son Grimoald, who died in 656. Thirty years of confusion followed, during which the Frankish lands were repeatedly portioned out and reunited, until, in 687, Pepin, frequently called Pepin of Herstal, the Austrasian mayor of the palace, overthrew the forces of Neustria and Burgundy in the battle of Testry, and thenceforth ruled as the *mayor domus* of a united Frankish kingdom. His son, Charles Martel (714–741), extended the frontiers of the kingdom in the east and in 732 repelled the tide of Saracen invasion in the battle of Tours or Poitiers. Charles's son, Pepin the Short, ruled in conjunction with his brother Karlmann till 747, and after that, alone. In 751 Childeric III, the last of the Merovingians, was deposed, and Pepin ascended the throne with the consent of the Pope. Under Charles the Great (qv), the son of Pepin, the Frankish power attained its greatest development. Germans and Latins were united under Charles's sway, which extended from the Ebro to the Eider and from the North Sea to Croatia and Slavonia. The most powerful monarch in Europe, he became also the secular head of the church, continuing in this manner the tradition of the old Roman Empire. His coronation as Roman Emperor took place in 800. Charles's successor, Louis the Pious, showed himself unequal to the task of holding together the huge empire which his father had created. Civil strife disturbed the last years of his reign. In 841, the year after his death, his sons, Lothair, Louis the German, and Charles the Bald, fought the decisive battle of Fontenay, and two years later, at Verdun, the Frankish Empire was partitioned among them. (See VERDUN, TREATY OF.) This marks the virtual dissolution of the Frankish monarchy, though Charles the Fat succeeded for a moment (894–887) in reestablishing the Empire. Its place is henceforth taken by the nations of France, Germany, and Italy.

The rôle played by the Franks in the history of Europe was one of capital importance. Of

all the barbarian peoples they showed themselves the most capable of assimilating the Roman culture of the countries which they conquered. Civilized, they became in turn the civilizers of the German stocks which had remained in their homes beyond the Rhine. Charles's campaigns against the Saxons carried Christianity into northern Germany. The elaborate machinery of government which he set up within the Empire established order and respect for the law in Europe, after such a manner as had not been known since the best days of the Roman Empire. Unlike the absolutism of Rome, however, the Frankish monarchy knew how to reconcile Imperial power with the rights of the subjects, as was shown in the retention of the national and local assemblages of freemen or representatives of freemen. Frankish law influenced profoundly the legal systems of all the nations of western and central Europe. (See *SALIC LAW*.) Most important of all, however, was the close connection between the Frankish monarchy and the Catholic church. The donations of Pepin and Charlemagne and the establishment of a new Roman empire may be said to have determined the general features of the political history of Europe during the Middle Ages. Consult Emerton, *Introduction to the Study of the Middle Ages* (Boston, 1895), Thierry, *Récits des temps mérovingiens* (Paris, 1882), Favre, *L'Empire des Francs* (ib., 1888), Fustel de Coulanges, *Histoire des institutions politiques de l'ancienne France—l'invasion germanique* (ib., 1891), Arnold, *Frankische Zeit* (Gotha, 1883), Waitz, *Deutsche Verfassungsgeschichte* (Kiel, 1882), Sergeant, *The Franks* (New York, 1898), Mullenhof, *Deutsche Altertumskunde* (5 vols., Berlin, 1891–1906), Lamprecht, *Frankische Wanderungen und Ansiedelungen* (Aix-la-Chapelle, 1882), Wietersheim, *Geschichte der Völkerwanderung* (2d ed., 2 vols., Leipzig, 1880–81), Hodgkin, *Italy and her Invaders*, vols. vii, viii (Oxford, 1899), Schultze, *Deutsche Geschichte von der Urzeit bis zu den Karolingern*, vol. ii (Stuttgart, 1896), *The Cambridge Medieval History*, vols. i, ii (New York, 1911–13).

FRANKS, SIR AUGUSTUS WOLLASTON (1826–97). An English archaeologist. He was born in Geneva, Switzerland, and was educated at Eton and at Trinity College, Cambridge. He was long associated with the British Museum as custodian of the department of British and mediæval antiquities and ethnography. During the last five years of his life he was president of the Society of Antiquaries, with which he had been closely identified for many years. His knowledge of Oriental and mediæval ceramics, jewelry, and objects of art was most extensive, and valuable collections which he made in all these branches came into the possession of the British Museum. In the department of Renaissance art he was also an acknowledged authority. His publications include *Book of Ornamental Glazing Quarries* (1849), *Examples of Ornamental Art in Glass and Enamel* (1858), *Hymyaritic Inscriptions from Southern Arabia* (1863), *Catalogue of Oriental Porcelain and Pottery* (1876–78), *Japanese Pottery* (1880), *Catalogue of a Collection of Continental Porcelain* (1896).

FRANQUEVILLE, PIERRE. See *FRANCHEVILLE*.

FRANCINI, fran-shé'né, STEFANO (1796–1857). A Swiss political economist and statis-

tician, born at Bodio in the Canton of Ticino. In 1829 he worked for constitutional reform in Ticino. In 1830 he was elected chancellor of the canton, and he was reelected in 1844. In 1848 he was elected member of the Federal Council. He did much for Swiss education, notably in the Zurich Polytechnic. In his *Statistica della Svizzera* (1827), *Statistica della Svizzera italiana* (1837–39), and *Uebersichten der Bevölkerung der Schweiz* (1851), he may be said to have laid the foundation of statistical science in Switzerland. He also wrote *Der Kanton Tessin* (1835). Consult the sketch by Gfeller (Bern, 1898).

FRANSECKY, frans'ki, EDUARD FRIEDRICH VON (1807–90). A German general, born at Geddern, Hesse. He entered the Prussian army in 1825 and in 1843 was called to the general staff. He fought with distinction in the Danish War of 1848 and in the Austro-Prussian War of 1866, where by his obstinate resistance against powerful odds he helped to decide the engagement at Munchengrätz, and also took a prominent part in the battle of Sadowa. As commander of the Second Army Corps during the War of 1870–71, he succeeded, after a forced march, in reaching the battlefield of Gravelotte in time to attack the heights of Point-du-Jour with the First Army. On December 1 he received command of the German forces between the Seine and Marne rivers and on the following day repelled General Ducrot's attempt to break through the lines at Champigny and Brie. He was the chief adviser of Manteuffel in his operations against the Army of the East under Bourbaki and compelled the French to retreat into Switzerland. In recognition of his services he received 450,000 marks from the government, the order of the Black Eagle, etc., and was appointed Governor of Berlin in 1879. He resigned in 1882. His memoirs were edited by Von Bremen (Bielefeld, 1901).

FRANTZ, frants, KONSTANTIN (1817–91). A German publicist. He was born near Halberstadt, was educated at Halle and Berlin, for a time studied and wrote on mathematics and philosophy, and after acting as private secretary in the Berlin Foreign Office was attached to the consular service in Spain for three years (1853–56). The central idea expressed in his works is the ultimate and inevitable confederation of central Europe against the United States and Russia, with the Teutonic peoples as a nucleus. His principal works are *Der Federalismus als das leitende Princip für die soziale, staatliche und internationale Organisation* (1879), *Die Weltpolitik* (1882–83), and a part of Schuchardt's *Die deutsche Politik der Zukunft* (1899). Consult Schuchardt, *Frantz, Deutschlands wahrer Realpolitiker* (Melsungen, 1896).

FRANTZIUS, fran'tsi-us, ALEXANDER VON (1821–77). A German explorer, born at Danzig. He was educated at Heidelberg and Berlin and became established as a physician at Alajuela and in 1853 at San José, Costa Rica, where he made extensive explorations, the results of which he published upon his return to Germany. His works include *Beiträge zur Kenntnis der Vulkane Costa-Ricas* (1861), *Das rechte Ufer des San Juanflusses* (1862), *Der südöstliche Teil von Costa-Rica* (1869), *San Salvador und Honduras im Jahre 1876* (1873). Several of his works have been translated into Spanish by Cortés, Carazo, and Twilight. He translated into German (1853) Aristotle's *Parts of Animals*.

FRANZ, frants, JULIUS (1824–87). A Ger-

man sculptor. He was born in Berlin and was taught by Wichmann and Fischer at the Academy of Art in that city. After gaining valuable experience in the studios of Wiedow and Rauch, he produced his first important work, "Shepherd and his Dog in Conflict with a Tiger" (1851, in the Sans-souci Garden near Potsdam). Many works are decorative rather than artistic in character and are distributed about the royal castles at Potsdam. Among the colossal groups executed by him in sandstone may be mentioned "America and England" (Berlin Borse), "Prussia and Hanover," after a design by F. A. Fischer (Belle-Allianceplatz, Berlin). He received a gold medal at the Berlin Exposition of 1858.

FRANZ, ROBERT (1815-92). A celebrated German composer, born at Halle. The family name was originally Knauth, but in 1847 it was officially changed. In spite of the opposition of his parents, Robert early began to study music, and when 20 years of age went to Dessau, where he was for two years a pupil of Friedrich Schneider. Upon his return to Halle he devoted himself to the study of the great masters of music, especially Bach, Handel, and Schubert, but it was not until 1843 that his first collection of songs was published. Schumann, Liszt, and Mendelssohn praised them highly, and this success gained for him a position as organist at the Ulrichskirche. He later became conductor of the Singakademie and director of music at the university. In 1868 Franz was compelled to resign his positions on account of deafness and ill health, and he was only kept from poverty by a series of benefits given by his friends in Germany and America. His arrangements of some of Handel's and Bach's works are standard, but it is as a song composer that his fame is assured. His 257 songs, which are written for solo voice and piano accompaniment, are similar in style to those of Schumann and of Schubert, and are scarcely excelled by theirs. In addition to his songs he composed a number of sacred works, the best of which are his six chorals. He died in Halle. His collected writings on the interpretation of works of Bach and Handel were published by R. Bethge (Leipzig, 1910). There are a number of biographical sketches of Franz by Ambros, Saran, Schaffer, Schuster, etc., of special note being that by R. v. Prochaska, *Robert Franz* (Leipzig, 1894).

FRANZ, SHEPHERD IVORY (1874-). An American psychologist. He was born in Jersey City, N. J., graduated in 1894 from Columbia University (where he was an assistant in psychology in 1897-99), and also studied at the University of Leipzig. He taught physiology at Harvard (1899-1901) and at the Dartmouth Medical School (1901-04), and was pathological psychologist at the McLean Hospital, Waverley, Mass. (1904-06), and after 1906 professor of physiology and experimental psychology at George Washington University. In 1907 he became psychologist and in 1910 scientific director of the Government Hospital for Insane at Washington, D. C. In 1911 he was president of the Southern Society of Philosophy and Psychology. He contributed largely to scientific journals and published a *Handbook of Mental Examination Methods* (1912).

FRANZ-DREBER, frants' drä'bër. See DREBER, HEINRICH FRANZ.

FRANZEN, AUGUST (1863-). An American portrait and genre painter. He was

born at Norrköping, Sweden, and came to the United States in early youth. He studied in Paris under Dagnan-Bouveret, and there laid the foundation for the conscientious work as a portraitist which mainly occupied his professional career. He established himself in New York, becoming a member of the Society of American Artists in 1894 and associate of the National Academy in 1906. Many distinguished men sat to him and his exhibitions were largely attended. A careful regard for the likeness and personality of each sitter characterizes his portraits, which are generally gray in tone and inclining towards the impressionistic treatment. He is represented in the Brooklyn Institute Museum by "Yellow Jessamine."

FRANZÉN, fran-tsän', FRANS MICHAEL (1772-1847). A Swedish author and poet, born at Uleåborg (Finland). While professor at the University of Åbo, he published his first volume of poems (1794). After the annexation of Finland to Russia (1809), he lived in Sweden and became successively pastor at Oiebio and Bishop of Hernösand (1831). He excelled in lyric poetry, particularly religious songs, some of which are accounted among the best in the Swedish language. His works include *Skaldestycken* (5 vols., 1824-36), *Samlade Dikter* (1867-69), and *Valda Dikter* (1871), lyric poems, *Gustav Adolf i Tydskland* (1817-18), an incomplete national epic, *Christopher Columbus* (1831), *Emil eller en afton i Lappland*, *Stante Sture*, and *Lappflickan i Kungsträdgården*. His *Minnesteckningar* (1848-60), a collection of biographies of prominent Swedes, are models of their kind.

FRANZENSBAD, frants'ens-bat. A fashionable watering place in Bohemia, Austria, situated about 1450 feet above sea level, in a somewhat barren, rolling country, 4 miles northwest of Eger (Map Austria-Hungary, C1). The town is pleasantly laid out with shady streets and charming parks, and is fully equipped as a health resort. It is chiefly famous for its chalybeate and saline springs, impregnated with carbonic-acid gas. They are 12 in number, and are considered especially efficacious for anemia and diseases of women. The mud baths (*Moorbader*), formed by mixing warm mineral water with pulverized mineral earth, are employed in cases of rheumatism and skin diseases. Pop., 1900, 2330. The chief industries are bottling water and extracting salts from the water. The waters of Franzensbad were mentioned as early as the sixteenth century, and the town was founded by Francis I in 1793.

FRANZENSKANAL, frants'ens-ka-nal, or BÄCKER CANAL. A canal of Hungary, since 1801 connecting the Danube and the Theiss. It is 67 miles long, 65 feet wide, and 6½ feet deep.

FRANZ JOSEF LAND, frants' yō-zéf. An Arctic archipelago, north of Nova Zembla and east of Spitzbergen, lying north of Asia, mainly between lat 80° and 82° N and long 42° and 65° E (Map Arctic Regions, J 3). It was discovered in 1873 by the Austro-Hungarian expedition under Weyprecht and Payer, and named in honor of their emperor. It is a group of about 100 small islands separated by fiords, channels, and sounds. The principal islands are Alexander, the most westerly point in long 42° 30' E, Graham Bell, the most easterly point in 64° 40' E, Wilczek; Prince George, Prince Rudolph, the most northerly point, Cape Fligely, in 81° 51' N, and Northbrook, the most

southerly point in 79° 50' N. In general the land is low, though Wullerstoff peak reaches a height of 2408 feet. The archipelago is still in the Glacial period, less than one-tenth of the land being ice-free. Spitzbergen and the Franz Josef archipelagoes, about 170 miles apart, are doubtless connected by a chain of islands along the eightieth parallel, as Victoria Island is only 50 miles west of Alexander Land and Gills Land 30 miles east of North East Land, thus leaving an unknown interval of less than 100 miles. The islands are volcanic and the geological formation is largely of Jurassic or Tertiary basalt, and in the lower strata fossils of plants and animals have been found. As the winter sun is absent more than four months, the climate is distinctly polar. The average temperature in the coldest month is about -19° F., and of the warmest month 35° F. The cloudiness varies from about 50 per cent in winter to 85 per cent in summer. Dense fogs often prevail. Violent gales continue for days at a time. There are magnificent auroral displays. The chief plants of Franz Josef Land are lichens, mosses, and grass. The willows, heaths, and sedges usually found at even this high altitude in other countries are here lacking. Of flowering plants, the chief are the yellow and white poppy, cresses, *Draba alpina*, scurvy grass, *Cerastium alpinum*, *Saxifraga*, alpine foxtail grass, and *Poa cenesia*. The vascular cryptogams are lacking. Few species of hepaticæ are present, *Marchantia polymorpha* (the common liverwort of Europe and America) being the most prominent. The mosses in numerous places form thick carpets, with a brilliant coloring of green and yellow and bright crimson. Sea algae are rare, but fresh-water algae are numerous. The lichens grow in profusion up to 600 feet above the sea. The variety of mammalian fauna is very limited. Polar bears are relatively plentiful, a few blue foxes are to be seen. Walruses are fairly abundant. The saddleback and ground seals are scarce, but the ringed seals, or "floe rats," are quite common. The avian fauna includes the snow bunting, eider duck, purple sandpiper, various gulls (the glaucous, kittiwake, and ivory), Richardson's skua, Brunnich's and black guillemots, and the little auk, brant goose, snowy owl, and Arctic tern. Only half a dozen species of insects have been found.

The exploration of the Franz Josef archipelago has been accomplished by the following expeditions: Leigh Smith, 1881-82; Jackson-Harmsworth, 1894-97; Nansen in his retreat, 1896; Wellman, 1898 and 1900; the Duke of the Abruzzi, 1899-1900, in which Cagni made the world's record of 86° 33'; Baldwin-Ziegler, 1901-02; and Fiala-Ziegler, 1903-05.

Consult Weyprecht, *Sulla spedizione polare austro-ungarica* (Triest, 1875); Payer, *New Lands Within the Arctic Circle* (Eng. trans., London, 1876); Greely, *Handbook of Polar Discoveries* (Boston, 1911); Jackson, *A Thousand Days in the Arctic* (New York, 1899); Duke of the Abruzzi, *On the Polar Star in the Arctic Sea* (2 vols., ib., 1903); Peters, *Ziegler Polar Expedition, Scientific Results* (Washington, 1907). See ARCTIC REGION, POLAR RESEARCH.

FRANZOS, frân-tsô's, KARL EMIL (1848-1904). A German journalist and novelist of Jewish descent, noted for his pen pictures of Eastern European life. He was born in Podolia, Oct. 25, 1848. His first volume, *Aus Halb-Asien*

(1876), won European success for its brilliant descriptions of life in Galicia, Rumania, and southern Russia. It was translated into several languages. This was followed by *Vom Don zur Donau* (1878) and many novels, usually of the same scenes that maintained his reputation. Of these the more noteworthy are *Die Juden von Barnow* (1879), *Ein Kampf ums Recht* (1882), the *Michael Kohlhaas* of Galicia, *Tragische Novellen* (1886), *Judith Trachtenberg* (1890), *Der Wahrheitsucher* (1894), *Mann und Weib* (1897).

FRAPAN, fra'pân', ILSE. The pseudonym of the German novelist and poet Ilse Leven (qv).

FRAPOLLI, fra-pôl'lê, LODOVICO (1815-78). An Italian patriot and diplomat, born at Milan. He was forced to enter the Austrian army in 1831, but left it as soon as he came of age. In 1840 he went to France and studied at the School of Mines. He wrote on the origin and formation of the earth, and on the geology of Finisterre and of the Scandinavian countries and Germany (where he traveled in 1843-47), and was made secretary of the French Geological Society. He took part in the fighting at Paris in February, 1848, and later in the year went to Milan, and held office in the War Ministry of the Provisional Government in Lombardy. Then he was Ambassador in Paris of Lombardy, Tuscany, and the Roman Republic in quick succession, but left the French capital after the capture of Rome, and lived in Switzerland and then in Sardinia, and again in France. He was Minister of War under Farini in Modena, but retired, and in 1860 joined Garibaldi's expedition to Sicily and entered Naples with him. He was an Italian deputy from 1860 to 1874, an extreme member of the Republican party. He was a leader of the Italian Freemasons and became Grand Master in 1869. In 1870 he again fought under Garibaldi in France. He died, after a long illness, in a sanitarium.

FRAS, or **FRAZ**, JACOB. See **VRAZ**, STANKO.

FRASCATI, fras-ka'tê. A beautiful summer resort in the Province of Rome, central Italy, on the north slope of the Alban Mountains (qv), 15 miles southeast of Rome (Map Italy, D 4). It is the residence of a cardinal bishop, and has two churches that were mentioned in monastic records as early as the ninth century. In the cathedral of San Pietro, dating from 1700, is a memorial tablet to Charles Edward Stuart, the Young Pretender of England, whose body, buried here in 1788, now lies in St. Peter's. Famous estates at Frascati are the Villa Torlonia (formerly Villa Conti), the Villa Lancelotti (formerly Villa Piccolomini), where in the sixteenth century Cardinal Baronius wrote his *Annales*, or Church history, the Villa Aldobrandini, built by Giacomo della Porta for Cardinal Pietro Aldobrandini, Clement VIII's nephew, which contains paintings by the Cavaliere d'Arpino, and the sixteenth-century Villa Tusculana or Ruffinella, the property once of Lucien Bonaparte and afterward of Victor Emmanuel II. This villa was the scene of the robbery of Lucien Bonaparte, which Washington Irving describes in his "Adventure of an Artist." Near by are the ruins of an amphitheatre, the so-called Villa of Cicero, a Roman theatre and reservoir, belonging to the ancient town of Tusculum (qv). Frascati first became important after the destruction of Tusculum in 1191. The city is noted for its wine. Pop. (commune), 1901, 9915, 1911, 10,577. Consult T. Ashby,

Papers of the British School at Rome, vol 1v (London, 1907)

FRASCH, HERMAN (1852-1914) An American chemist and inventor, born in Gaildorf, Wurtemberg, Germany. He took up the practice of pharmacy in 1868 and, coming to America, entered the laboratory of Professor Maasch at the Philadelphia College of Pharmacy, where he became so interested in industrial chemistry that in 1874 he established a laboratory of his own. His earlier inventions facilitated the production of wax, oil, white lead, and salt. In 1885, when he went into the petroleum business for himself in London, Ontario, he devoted himself so successfully to the refining and purification of Canadian oils that his product, the highest grade of pure oil, was able to compete with the Pennsylvania oil. The patents so successfully developed, as well as the works themselves, were purchased by the Standard Oil Company in 1888 and the processes were put into practice immediately at their various plants in the United States. From this time on a further series of patents for the treatment of petroleum and petroleum products were issued to Mr. Frasch, but it was in 1890 that he received the patent for what must be considered an epoch-making improvement in the sulphur industry. Erecting a plant at the deposits of native sulphur in Louisiana, by the use of superheated water sent down through a boring (at a depth of 1000 feet), he melted the sulphur, which was forced to the surface through an inner tube. The melted sulphur, pumped into bins about 50 feet high, would congeal, and the huge blocks later would be broken up by blasting and loaded directly into cars by a derrick of two tons' capacity. From these cars the sulphur would be loaded immediately into vessels for shipment to various coast and foreign ports. The result of this invention was that from 1903 the imports of sulphur into the United States diminished from 181,130 tons, valued at \$3,549,370, to 19,389 tons in 1914, in which year also there were exported 110,022 tons, valued at \$2,018,724. For the economic effect of this invention in the United States and Europe, see SULPHUR. In 1912 Frasch was awarded the Perkin medal.

FRA'SER, ALEXANDER (1860-) A Canadian author and Gaelic scholar. He was born in Inverness-shire, Scotland, and was educated at a classical academy, Perth, and at Glasgow University. Coming to Canada in 1886, he engaged in journalism, becoming city editor of the *Toronto Mail* and later of the *Toronto Mail and Empire*. He also edited successively the *Scottish-Canadian*, the *Presbyterian Review*, and *Fraser's Scottish Annual*. He took a prominent part in founding the regiment of the Forty-eighth Highlanders, Toronto. For some years he was lecturer in Gaelic at Knox College in that city, and in 1895 he delivered the annual Gaelic address before the Gaelic Society at Inverness, Scotland. He was elected president of the Gaelic Society of Canada and of the Canadian Folklore Society. In 1903 he was appointed archivist of Ontario. He published *Short Scottish-Canadian Biographies*, *Essays on Celtic Literature*, *Practical Lessons in Gaelic Grammar*; *The Mission of the Scot in Canada*, *The Last Laird of MacNab* (1899), *The 48th Highlanders of Toronto* (1900), *The History of Ontario* (1907), *The Brock Centenary, 1812-1912* (1913).

FRA'SER, ALEXANDER CAMPBELL (1819-1914) A Scottish philosopher. He was born in Argyllshire, was educated in Edinburgh University, and from 1846 to 1856 was professor of logic in New College, Edinburgh. After contributing extensively to the *North British Review*, he became editor in 1850 and held this position until 1857. In 1856 he succeeded Sir William Hamilton as professor of logic and metaphysics in the University of Edinburgh, retiring in 1891. His work treats the three great problems—the material world, man, and God—in their mutual relations. The first is discussed in his *Collected Edition of the Works of Bishop Berkeley, with Annotations and Dissertations* (4 vols, 1871, enlarged ed, 1901) and in a *Biography of Berkeley* (1881), the second in his *Annotated Edition of Locke's Essay on the Human Understanding, with Prolegomena Critical and Historical* (1894), and the three in his collected lectures on the *Philosophy of Theism* (2 vols, 1896, 2d ed, 1899) and his *Biography of Thomas Reid* (1898). He advocates a practical faith in the divine order of a universe incompletely interpretable. He also published *Biographica Philosophica: A personal Retrospect* (1904), *Our Final Venture* (1907), *Berkeley and Spiritual Realism* (1908).

FRASER, ALEXANDER MACKENZIE (1756-1809) A British general. He was educated at Aberdeen and after a few years in the banking house of Forbes and Company, in Edinburgh, accepted (1778) a commission in the Seventy-third Highlanders. He served in the defense of Gibraltar and as recruiting officer and retired from the army in 1784, when he married Helen Mackenzie. In 1793 he was commissioned major in the Seventy-eighth Highlanders. He was sent to Guernsey and in the following year to Flanders, covered Abercrombie's retreat before Pichegru and distinguished himself in the sortie from Nimeguen and at Geldermalsen (1795). In 1796 he served at the Cape of Good Hope and a year later went to India, where he campaigned against the Mahrattas. When he returned to England, he was elected to Parliament and received the grade of major general (1802). In the next year he inherited property from his aunt and mother and took their family name (Fraser) in addition to Mackenzie. After service in England, Hanover, and with Henry Edward Fox (q.v.) in Sicily, he was chosen by Fox to command an expedition to get control of Egypt, but fared very badly at Rosetta, after capturing Alexandria, and had to return to Sicily. Sent to Portugal (1808), he advanced with Moore into Spain, showed great military ability in the retreat through Galicia and at Corunna, and was made lieutenant general. In the following year he sickened while on the Walcheren expedition and died soon after his return to England.

FRASER, CHARLES (1782-1860) An American miniature and landscape painter. He was born in Charleston, S. C., practiced law for 10 years to acquire the means of continuing his art, and eventually was very successful as a miniature painter. He painted Lafayette's portrait in 1825 and the miniatures of many prominent citizens of the South and also produced many landscape and genre pictures. In 1857 he exhibited in Charleston 313 miniatures and 139 oil paintings. He wrote *Reminiscences of Charleston* (1854) and contributed to various periodicals.

FRASER, CHRISTOPHER FINLAY (1839-91) A Canadian statesman. He was born in Brockville, Ontario, and was largely self-educated. After being employed as a printer in the office of the *Brockville Recorder*, he studied law and was called to the bar of Upper Canada in 1865. He successfully practiced in Brockville, but soon began to take an active interest in politics and after confederation in 1867 was an unsuccessful Liberal candidate for the House of Commons. In 1872 he was elected to the Ontario Legislature and, although unseated on petition, was re-elected in the same year and remained a member of that body until the close of his public life. In 1873-74 he was Provincial Secretary and Registrar in the cabinet of Sir Oliver Mowat (qv) and in 1874 became Commissioner of Public Works, an office which he retained during the rest of his parliamentary career. Fraser was a man of sympathetic and attractive personality and an eloquent speaker and strong debater. His chief claim to political recognition was his successful leadership of the United Roman Catholic League, an association formed to give the Catholics of the province more efficiency in asserting their rights and in molding legislation.

FRASER, DONALD (1826-92). A Scottish Presbyterian minister, born at Inverness. He graduated at the University of Edinburgh in 1842 and, after studying theology at Knox College, Toronto, and at New College, Edinburgh, held pastorates in Montreal, Inverness, and at the Maylebone Presbyterian Church, London (1870-92). His works include *Synoptical Lectures on the Books of the Holy Scriptures* (3 vols., 1871-76), *The Church of God and the Apostasy* (1881), *Thomas Chalmers* (1881), *The Speeches of the Holy Apostles* (1882), *Metaphors in the Gospels* (1885), *Seven Promises Expounded* (1885), *Sound Doctrine* (1892). Consult his *Autobiography* (London, 1892), edited with select sermons by Dykes.

FRASER, JAMES (1818-85). An English prelate, born at Prestbury, Gloucestershire. He was educated at Lincoln College, Oxford, from 1840 to 1860 was fellow of Oriel, where he was tutor in 1842-47 and subdean and librarian in 1844-47, and from 1847 to 1860 was rector of Cholderton, Wiltshire, and in 1860-70 of Upton Nervet, Berkshire. In 1858 he received the appointment of assistant commissioner to the Royal Commission on Education and made in 1859 a valuable report on the district assigned to him. In 1865 he visited the United States and Canada as a commissioner on education and in 1866 rendered a second noteworthy report (*Report on the Common School Systems of the United States and of the Provinces of Upper and Lower Canada*). In 1870, having refused the bishopric of Calcutta, he was consecrated Bishop of Manchester. His administration of this diocese, undertaken amid very grave difficulties and carried on with remarkable activity, resulted in the establishment of 109 new district parishes, the consecration of 99 new churches, and the introduction of an admirable system of machinery for diocesan work. He won the esteem of all Non-conformists, including the Greek and Jewish congregations at Manchester, and was called "bishop of all denominations." Theologically he was of the old High Church school and opposed to the Tractarian movement. In his charities he was liberal. He published nothing beyond his reports as parliamentary commissioner and a

few addresses and sermons. Two volumes of his sermons, edited by J. W. Diggle, appeared in 1887-88. Consult Hughes, *The Second Bishop of Manchester* (London, 1887), Diggle, *The Lancashire Life of Bishop Fraser* (3d ed., 1b., 1889), Bryce, *Studies in Contemporary Biography* (New York, 1903).

FRASER, JAMES BAILLIE (1783-1856). A British traveler and author, born at Reelick, Inverness, Scotland. He went to the West Indies early in life and later to India, where in 1815 he explored the Himalayas with his brother William. In 1821-22 he traveled in Persia, whither he returned in 1834-35 on a diplomatic mission, and in 1835 he entertained on behalf of the British government the two exiled Persian princes. His travels and adventures furnished material for romances. He wrote *Journal of a Tour through Part of the Himālā Mountains and to the Sources of the Jumna and the Ganges* (1820), *The Kuzzulbash, a Tale of Khorasan* (1828), *The Persian Adventurer* (1830), *An Historical and Descriptive Account of Persia* (1834), *The Dark Falcon* (1844), *Military Memoirs of Col James Skinner* (1851).

FRASER, MARY CRAWFORD (MRS HUGH). An English author, the daughter of Thomas Crawford the sculptor, and sister of Marion Crawford the novelist. She was born in Rome, was educated in England and in Rome, married Hugh Fraser, afterward Minister to Japan, traveled with her husband in the two Americas and in the East, and was received into the Roman Catholic church in 1884. Mrs Fraser's finest literary work is found in her interpretations of the new Japan, the land and its people. In 1899 she published *A Diplomat's Wife in Japan* (new ed., 1911) and five stories, called *The Customs of the Country, or Tales of New Japan*. She has depicted Devonshire life in *A Chapter of Accidents* (1897) and modern Roman society in *The Splendid Porsenna* (1899). Her work also includes *Letters from Japan* (1904); *A Diplomat's Wife in Many Lands* (1910), *Further Reminiscences of a Diplomat's Wife* (1912); *The Honor of the House*, with J. I. Stahlman (1913), *Italian Yesterdays* (1913); *The Bale Fire*, with her husband (1914).

FRASER, SIMON. See LOVAT, twelfth Lord. **FRASER, SIMON** (c 1729-77). A British soldier, born in Balnain, Inverness-shire. He was a subaltern in a battalion of the Earl of Drumlanrig's regiment in the Dutch service, was wounded at Bergen-op-Zoom in 1748, and in 1749 was pensioned upon the reduction of the two battalions to one. In 1757 he was appointed a captain lieutenant in the Second Highland Battalion (later the Seventy-eighth Highlanders) and was promoted to the rank of captain in 1759. He was at the siege of Louisburg and in the action at Quebec. He afterward served in Germany, at Gibraltar, and in Ireland, and in 1768 became lieutenant colonel of the Twenty-fourth Foot. With the rank of brigadier for America, he accompanied Burgoyne in the pursuit of the American forces retreating from Fort Ticonderoga under the command of St. Clair, and at Hubbardton (July 7, 1777) he won a complete victory over them. He fought in the first battle of Saratoga (September 19), and was mortally wounded in the second (October 7).

FRASER, SIR THOMAS RICHARD (1841-1920). An English physician, born at Calcutta

and educated at the University of Edinburgh, where he graduated in medicine in 1862. He was assistant physician in the Royal Infirmary, Edinburgh (1869-74), a member of the Admiralty committee on Sir George Nares's Arctic expedition in 1876-77, and in 1877 became professor of *materia medica* at Edinburgh and of clinical medicine in the year following. He was dean of the faculty of medicine from 1880 to 1900, president of the Indian Plague Commission (1898-1901), president of the Royal College of Physicians of Edinburgh (1900-02), of the Medicochirurgical Society (1901-03), and of the Association of Physicians of Great Britain and Ireland (1908-09). In 1902 he was knighted. Known as an authority on poisons, he published *An Investigation into Some Previously Undescribed Tetanic Symptoms Produced in Cold-blooded Animals* (1867-68), *An Experimental Research on the Antagonism between the Action of Physostigma and Atropia* (1870), *The Character, Action, and Therapeutic Uses of Physostigma* (1883), which won the Barbier prize from the Academy of Sciences, Paris, and the *Dyspnoea of Bronchitis and Asthma* (1887).

FRASER, SIR WILLIAM (1816-98). A Scottish genealogist, born in Kincardineshire. He became deputy keeper of the records at Edinburgh in 1850. The valuable material there enabled him to prepare his numerous genealogical works, which though dry in style are of great importance to the student of Scottish history. From 1869 to 1898 he drew up reports on Scottish historical manuscripts for the Royal Commission on Historical Manuscripts. He gave £25,000 to found a professorship of paleography and ancient history at Edinburgh and an equal sum for homes for the poor of the city. Among his works are *History of the Carnegies, Earls of Southesk* (2 vols, 1867), *The Chiefs of Colquhoun and their Country* (2 vols, 1869), *The Lennox* (2 vols, 1874), *The Douglass Book* (4 vols, 1885), *The Elphinstone Family Book* (2 vols, 1897).

FRASER, WILLIAM ALEXANDER (1859-). A Canadian poet and novelist. Born and educated in Pictou Co., Nova Scotia, he early went to New York, then to Boston, and afterward to India (where he lived seven years at one time and a year and a half at another). Five years he spent in the Canadian Northwest. The life of these regions is vividly described in his writings, which include, besides a large number of short stories which appeared in the best American and British periodicals *The Eye of a God, and Other Tales of East and West* (1899); *Mooswa and Others of the Boundaries* (1900); *The Outcasts* (1901), *Sorrow and Old Friends* (1901), *Thoroughbreds* (1902), *The Blood Lines* (1903), *Brave Hearts* (1904), *The Sa'-zada Tales* (1905), *Thirteen Men* (1906), *The Lone Furrow* (1907). Among his poems are the words of a national song entitled "Canada, God, and our Land."

FRASER, SIR WILLIAM AUGUSTUS (1826-98). An English politician and author, educated at Eton and at Christ Church, Oxford. Entering the army, he rose to a captaincy in 1852, but resigned his commission and entered Parliament in the Conservative interest. He represented Barnstable (1852 and 1857), Ludlow (1863), and Kidderminster (1874-80). Fraser became famous in London society for his stories and anecdotes concerning Wellington

and Disraeli. He published *Words on Wellington* (1889), *The Waterloo Ball* (1897), *Disraeli and his Day* (1891), *Hic et Ubique* (1893), *Napoleon III* (1896). His library was sold at auction for over £20,000.

FRA'SERA. A genus of North American plants of the family Gentianaceae, comprising about 10 species, and named after John Fraser, an English botanist. The species are strong-growing, single-stemmed, usually biennial herbs with thick bitter roots, opposite or whorled leaves, and bluish, white, or yellowish, generally spotted flowers in cymose clusters. They are rarely seen in cultivation.

FRA'SERBURGH. A seaport in Aberdeenshire, Scotland, 42 miles north of Aberdeen (Map Scotland, G 2). It is the chief seat of the Scottish herring fishery and, besides cured herrings and cod, exports oats, barley, meal, and potatoes. It has three tidal harbors, and its shipping includes 14 sailing vessels, 8 steam vessels, and a fleet of 700 fishing boats. The herring trade is valued at \$1,000,000 yearly. The town possesses a handsome cross, town hall, and spacious customhouse, the streets are wide and clean, with substantial dwellings. Its site is immediately south of Ptolemy's Promontorium Tœxalium, now Kinnaird Head, on which stands Fraser's ancient castle, utilized as a lighthouse, with its mysterious wine tower and a cave beneath. Pop., 1901, 9000, 1911, 11,151, with a large increase during the fishing season in July and August.

FRASER RIVER. The principal stream of British Columbia, comprising in its basin of 138,000 square miles the greater part of the province (Map British Columbia, D 3, 4). The Fraser River proper has its origin in the union of two branches, the more important of which receives its waters from a series of lakes that lie in lat 54° to 55° N, long about 124° 50' W, and flows in a general southeast direction for 160 miles, where it unites with the other branch, 200 miles long, which has its source near Mount Brown in the Rocky Mountains. The point of confluence is near Fort George, and thence the Fraser River flows in a generally southerly direction through nearly the whole length of the province and, after a total course of about 750 miles, empties into the Gulf of Georgia between Vancouver Island and the mainland, just north of the international boundary of 49° N. latitude. Its chief affluents are the Stuart, the Blackwater, the Nechaco, the Bridge, and the Chilcotin on the right, and the Thompson and Quesnel on the left. Between the Stuart and the Chilcotin, and on the same side, the Fraser River is joined by a small affluent of historical interest—the West Road River—which took its name from its having been ascended by Sir Alexander Mackenzie on his adventurous journey of 1793 from the Hudson Bay territories to the Pacific Ocean. The Fraser River is navigable for small and powerful steamboats as far as Fort Hope, and at high water to Yale, about 100 miles from its mouth, while as far as New Westminster, about 15 miles from its mouth, it is navigable for ships drawing 20 feet of water. Another stretch of 100 miles in the interior is also navigable for small craft, from Soda Creek to Fort George Cañon. Above Fort Hope the river sweeps through Big Cañon, which is traversed from Lytton downward by the Canadian Pacific Railway. From April to August the river is sub-

ject to floods, caused by the melting snow on the mountain ranges. In the narrow mountain valleys the river rises as much as 60 feet above its normal height and in the lower valleys covers 150,000 to 200,000 acres of rich land.

In 1857 the Fraser River, in its auriferous diggings and washings, began to stand forth as the rival of California and Australia. The discoveries, originally confined to the lower basins, have become more extensive and more productive, and eastward on the Thompson and northward among the upper waters of the great artery of the country, especially in the Cariboo district south of Fort George, the precious deposit has sometimes given almost fabulous returns. After 1862 washings and surface diggings were succeeded by systematic mining and steady labor. The river, its tributaries, and the numerous lakes communicating with them, furnish great facilities for the transport of timber. The lower Fraser country especially is densely wooded. The salmon of the river, of which there are five species, are justly famous, and the fishing and canning industries are of considerable importance. The river takes its name from Simon Fraser, who, in spite of the hostility of Indians and the natural difficulties to be overcome, explored it to its mouth in 1808.

FRASER RIVER SALMON. A species of salmon (*Oncorhynchus nerka*), called blueback, redfish, etc., which is the most common and valuable one in and near the Fraser River, British Columbia. See SALMON, REDFISH, Plate of SALMON.

FRA/SERVILLE, or RIVIÈRE DU LOUP, ré'vyâ' du lû (EN BAS). A town, summer resort, and important railway centre of Temiscouata Co., Quebec, Canada, picturesquely situated on elevated ground at the confluence of the Rivière du Loup with the St. Lawrence, 118 miles by rail northeast of Quebec (Map Quebec, J 3). It is on the Intercolonial Railway and is the terminus of the Temiscouata Railway. It has the Fraser Institute and other educational establishments and carries on a considerable general trade. The manufacturing industries include flour, shingle, and pulp mills, chair, sash and door, furniture, and butter factories, a foundry, machine shops, and a brick plant. The repair shops of the Temiscouata Railway and railway shops of the Intercolonial Railway are located here. The town owns its lighting, water-works, and sewerage plants. It is much frequented for its shooting, angling, boating, bathing, and its scenery. Pop., principally French-Canadian, 1901, 4569, 1911, 6774.

FRASIER, frâ'zhër (OF, Fr., strawberry plants, from *frase*, strawberry, from Lat *fragum*, strawberry plant). In heraldry, a strawberry flower appearing in the arms of the Scottish family of Fraser, called by English heralds a cinquefoil and known also as a primrose. See HERALDRY.

FRATERNAL INSURANCE. The characteristics which distinguish fraternal insurance from other forms are not to be sought in any peculiarity of the insurance itself, but rather in the nature of the body which grants it. There is no single feature of fraternal insurance which is not to be found in other systems of life insurance. Fraternal insurance is insurance granted by a "fraternal beneficiary" society or order to its members. The essentials of such a society, as laid down by the National Fraternal Congress, are, that it should be organized in a

system of lodges, that it should have a ritual and a representative form of government, that it should pay benefits, and should not conduct its business for profit. Such societies have almost invariably collected their premiums by means of assessments, but the assessment principle is not essential to their business, and on the other hand its use is by no means confined to such organizations. A great deal of undesired odium has attached to fraternal insurance societies owing to the failure to discriminate between them and commercial assessment companies. The history of the latter is for the most part a record of inefficiency or dishonesty on the part of the managers and credulity on the part of the members, ending in a large proportion of cases in financial disaster.

History. The early American fraternal societies were established somewhat on the lines of the English friendly societies, several of which founded branches in the United States during the first half of the nineteenth century. Both the English and the early American societies paid benefits of various kinds, often including funeral benefits and payments to the survivors of the deceased members, but none of them established a system of payments deserving the name of life insurance. The first person in the United States to recognize the possibilities of developing on a large scale cooperative relief in the form of death benefits or life insurance through a system of affiliated lodges was John Gordon Upchurch, who founded in 1868 the Ancient Order of United Workmen. Several other benefit societies, organized on the lodge system, were established during the next decade. Some of these introduced the insurance feature at once, led to it by the high rates charged by the old-line companies and the harsh provisions of their policies. A more powerful impetus towards the introduction of insurance into such societies came in the seventies, when more than 60 legal-reserve old-line companies failed, creating a feeling of distrust and hostility towards them. Under the influence of this feeling fraternal societies already established introduced the insurance feature, new societies providing for it were formed, and nonfraternal assessment insurance companies appeared in large numbers. In the decade 1881-90 many additional fraternal insurance companies were organized. The eleventh census reported that on Dec 31, 1889, there were in the United States 298 such orders, with 40,342 subordinate lodges. Owing to unsound financial method, many of these were short-lived, so that, in spite of the founding of many new orders, since 1890 there has probably been no increase.

It is impossible to compile a complete list of fraternal insurance societies, since in many States they are exempted from the duty of making reports to the Insurance Department. The reports for the year ending Dec 31, 1913, of 75 fraternal insurance societies doing business in the State of New York show a total of insurance certificates of 5,032,284, with protection in force at the end of the year aggregating \$6,163,020,552. Of the societies reporting, the one having the largest membership was the Modern Woodmen of America, which had 962,966 certificates, representing \$1,545,759,000 protection, in force. The aggregate sum paid by members was \$80,461,386, and the total disbursements for losses were \$64,091,344. The expenses were \$10,386,102. The 34 joint-stock and mutual life-

insurance companies in the State reported to the same department Dec 31, 1913, an aggregate of 7,001,913 policies, with \$13,527,321,222 protection in force. Losses and claims were \$246,459,831, while premium receipts aggregated \$597,202,210.

Organization and Activities The forms of organization of the fraternal orders are various. Their government is representative and is vested in a supreme body consisting of an executive head and certain official associates. In some orders State lines are observed and State officers exercise immediate jurisdiction in many matters over the local lodges in the State. While nominally subordinate to the general body, they are more or less masters of the order in their own territory. Some orders have no intermediate State organization, the local associations are directly affiliated with the supreme body. The Ancient Order of United Workmen may be cited as an illustration of the former class, the Independent Order Sons of Benjamin of the latter. The activities of the different orders are also very various. It is unnecessary to speak of the social features which constitute so important a part of their life. These are entirely under the control of the local bodies and manifest little approach to uniformity. In the matter of benefits also there is very great diversity. Some of the societies give only death benefits, others give benefits of many other kinds, such as disability, accident, sickness, burial, and monument benefits. These miscellaneous benefits are usually supported and managed by the local lodges. The death benefits, on the other hand, are usually under the control of the supreme national body, in a few orders they are maintained by the general State organization. Three federations of fraternal beneficiary associations have been formed—the National Fraternal Congress, the American Fraternal Congress, and the Associated Fraternities of America. The National Fraternal Congress was formed at a meeting held in Washington in 1886, at which delegates from 17 orders were present. In the constitution the objects of the congress are “declared to be the uniting permanently of all legitimate fraternal benefit societies for the purposes of mutual information, benefit, and protection.” In recent years it has devoted a large part of its time and energy to the attempt to accomplish two objects. The first is the voluntary increase of assessment rates by the affiliated orders for the purpose of accumulating reserves, or, as they prefer to call them, emergency funds, the second is the securing of uniform legislation by the various States on matters affecting fraternal insurance. Some of the specific measures advocated by them will be referred to later on.

The American Fraternal Congress was organized at Omaha, Neb., in 1898, by representatives of 18 fraternal orders. The purpose of this organization was to work for the establishment of reserve funds by the fraternal societies. No society without a reserve fund was eligible to membership. The National Fraternal Congress has done so much work along the same line that the more recent federation had little occasion to act and has not become very prominent. The Associated Fraternities of America was organized at Chicago in 1901 by representatives of the younger fraternal orders. Forty-two societies were represented at the meeting. The first annual meeting was held in July, 1901, 24

associations being represented. In its early years the Associated Fraternities of America was vigorously opposed to the policy of the National Fraternal Congress of seeking legislation fixing a minimum assessment rate. The two organizations soon sank their differences, however, and cooperated in many cases in legislative programmes. In 1913 they formed an amalgamation under the name of the National Fraternal Congress of America.

Technique Assessment insurance was organized largely in protest against the methods of the old-line life-insurance companies. It was generally believed that the cost of insurance in those companies was unnecessarily high. A reduction in cost was anticipated from two sources. In the first place it was proposed to reduce the expense of management to a minimum and in this way to cut down the “loading” which the old-line companies added to the natural premium. In the second place it was proposed to do away with the enormous surpluses which the old-line companies were popularly supposed to be continually accumulating and never paying out. “Pay your losses as they occur and keep your reserve in your own pockets,” was the maxim of the advocates of the assessment principle. No financial craze recorded in history has affected more people, or people with sounder judgment in ordinary business matters, than did the assessment craze. Its culmination was reached in the establishment of a large number of assessment endowment societies, which guaranteed to every member a certain stipulated sum at the end of a fixed period of time in return for a number of periodical payments to the company. The Iron Hall was the first and most notorious of these associations. This organization virtually promised its members that in consideration of the annual payment to the society for seven years of 18 assessments of \$2.50 each, making a total contribution of \$315, each member should receive from the society \$1000 at the end of the seven years. For a few years such payments were actually made, the endowments of the early members coming out of the contributions of the new members. Only by a steady increase of membership at a continually increasing geometrical ratio could such a system be maintained. The Iron Hall and all its imitators came to grief within a few years, bringing loss upon millions of people in the United States.

The assessment life-insurance companies were managed on no sounder principles than the assessment endowment societies. At the beginning all of them, whether fraternal or non-fraternal, raised their funds by assessments after the death for which indemnity was to be paid. In the early days of an assessment company, while the average age of the members was low and the benefit of medical selection was still felt, these assessments were very small. Knowledge of the scientific principles of life insurance was not to be found among the promoters of these companies. The need of mortality tables and the desirability of accumulating a surplus during the earlier years to prepare for increasing mortality were both denied. It was the general claim that the continual accession of new members would prevent any advance in the average age of the members or in the death rate. This might have been the case if a company had been started with a membership whose age distribution was properly related to a sound

mortality table. It could not possibly be the case in a company which started, as all these companies did start, with a great preponderance of young members. In such a company it is clear on a priori grounds that the average age of members must increase. Experience soon demonstrated the same fact. The average age of members and the death rate increased, and the inevitable increase in the rate of assessment kept new members out of the society, and, on the other hand, the lapse rate continually advanced, through the withdrawal of members who were unwilling to pay the increased assessments, or desired to join new societies in which the average age, death rate, and assessments were still low. The vast majority of nonfraternal assessment societies and a large number of fraternal associations were in this way forced out of business.

The greatest enemies of an old-established fraternal insurance society are unreasonable expectation created by unjustifiably low rates at the beginning, and new companies with low mortality and small assessments. Realizing this fact, the old societies adopted two lines of action to protect themselves. In the first place they undertook a campaign of education among their own members. Year after year they analyzed the returns of the constituent orders and pointed out the inevitable advance from year to year in average age, in death rate, and in cost of insurance, as well as the tendency of the members to desert the old companies and flock to the new. A comparison of the average annual death rate in different years for the entire congress has no significance, since old companies with a high death rate are continually passing away and new companies with low death rates coming in. At the meeting of the congress in 1899 the report of the committee on statistics pointed out that while the average death rate for the whole body was 8.65 per 1000 in 1898, as compared with 9.32 in 1897, if allowance was made for the influence of the new orders in lowering the rate (it was impossible to make allowance for the similar effect of the withdrawal of the older orders), the figures would be 8.87 in 1897 and 8.89 in 1898. The committee also compiled the death rates for 21 companies for each of 10 years. In 1888 the average had been 7.22, in 1893, 9.34, and in 1898, 10.84. As to the effect of these changes upon membership it was shown that of the 46 orders reporting that year 19 had a death rate above the average for the group, and 27 a rate below the average, that the 19, with a membership at the beginning of the year of 869,862, had made a net gain during the year of only 2415, and that the 27, with a membership at the beginning of the year of 1,192,811, showed a net gain of 217,282. The rate of gain in the former group was 0.28 per cent and in the latter 18.26 per cent.

In a similar way the committee demonstrated that average age and cost of insurance both increase as the society grows older. Thoroughly aroused by such revelations, the congress authorized the appointment of a committee to prepare tables of rates by applying to a proper extent the principles of a reserve or an emergency fund. This committee first prepared a new mortality table, after investigation which convinced it that the tables of mortality in use by the old-line companies were higher than experience justified. The divergence between the old tables

and the new ones is brought out by the following comparison of the death rate per 1000 living at different ages.

AGE	American experience table	Fraternal table	AGE	American experience table	Fraternal table
20	7.81	5.00	60	26.69	22.75
25	8.07	5.20	65	40.13	34.40
30	8.43	5.57	70	61.99	53.65
35	8.95	6.15	75	94.37	85.48
40	9.79	7.17	80	144.47	138.10
45	11.16	8.88	85	235.55	225.10
50	13.78	11.45	90	454.55	368.95
55	18.57	15.71	95	1000.00	606.78

While the mortality experience of every old-line life-insurance company which exercises due care in the selection of its risks shows a rate of loss below that indicated by the American experience table, the degree of difference between the two tables here outlined gives reason to think that the fraternal table is very close to the margin of safety. According to the report of the National Fraternal Congress for 1913, the number of deaths during the year was 96.27 per cent of the expected deaths. Dividing risks into two classes, those under 50 and those over, it appears that the ratio of actual deaths expected was 83.35 per cent for the former and 112.74 for the latter. These figures are substantially repeated year after year.

On the basis of the new mortality table, and on the assumption that the reserve will earn 4 per cent interest, the committee prepared several tables of minimum rates. Besides the level annual rate, such as is commonly used by old-line companies for whole-life policies, the committee prepared a table of rates peculiar to the fraternal and assessment societies, the so-called step rate. The step rate advances with advancing age, but not from year to year as the natural premium rate does, but at stated intervals, usually every five years. By a modification of the step-rate plan a slight addition is made to the premium rate during the earlier years, in order to make possible a reduction of the rate in old age. All the rates prepared by the committee presupposed the abandonment of the system of assessing after the occurrence of the loss and the accumulation of a surplus at least for one year. The congress urged its members to adopt as minimum rates those prepared by the committee, with such loading for expenses as each association found necessary. Some organizations did this, but the extent to which changes were introduced was very unequal. The result was a high degree of diversity of rates. At the National Congress for 1899 there was exhibited a table of rates actually charged for the same kind of insurance at the same age in different fraternal societies. At age 50, e.g., no less than 41 rates for the same protection were in force in different companies, varying by moderate differences from a minimum of 65 cents to a maximum of \$3.80.

Despairing of its ability to secure the adoption of the new rates through the voluntary action of the orders, and dreading the effect of the competition of new orders with low rates, the congress undertook to secure the adoption of these rates through legislation. In the session held in 1901 the president reported that legislation requiring the establishment of these minimum rates as conditions of doing business in

the State had been secured in five States, viz., North Dakota, Tennessee, Washington, Vermont, and Indiana. At the Congress of Insurance Commissioners at Colorado Springs in 1909, at the instance of the president of the National Fraternal Congress, a bill was prepared the provisions of which were calculated to insure the solvency of the orders. This bill was indorsed, in modified form, at the Mobile Congress in 1910, and hence is known as the Mobile Bill. The bill requires the orders to make reports of condition, in which reports certificates shall be valued on the basis of the National Fraternal Congress table, as minimum, and returns from investments shall be calculated at not above 4 per cent. The Mobile Bill had been enacted in 1913 in 11 States and had been put into operation by insurance-department ruling in two States. An amended form of this bill, known as the New York Conference Bill, had been adopted in 14 States. Six other States have enacted laws having substantially similar provisions. In the 33 States covered by such laws no society can be organized except on the basis of fairly adequate rates.

Rates in the fraternal companies can be legitimately kept below rates in the regular companies in only two ways—either by making such a selection of lives that the rate of mortality is lower in the former than in the latter, or by keeping expenses of management below those of the old-line companies. To a greater or less extent both these aims are accomplished. There can be no doubt that the close personal scrutiny which every individual undergoes before being admitted to a lodge is a valuable supplement to the medical examination. If it is found that the mortality schedule adopted is sufficiently high, rates may legitimately be put below the old-line level. Moreover, the expense of management in the fraternal is reduced to a minimum. It is clear, therefore, that there are great opportunities for economy by the fraternal companies, and it may fairly be expected that those among them which take to heart the lessons of experience and put their business on a sound basis, so far as the matter of surplus is concerned, will continue their usefulness indefinitely, furnishing insurance in comparatively small amounts at low rates to those most in need of it and least able to pay for it at high rates. Consult F. H. Bacon, *Treatise on the Law of Benefit Societies and Life Insurance* (3d ed., 2 vols., St. Louis, 1904). See FRIENDLY SOCIETY.

FRATERNITIES (Lat. *fraternitas*, brotherhood, from *fraternus*, brotherly, from *frater*, brother, connected with Gk *φράτηρ*, *phratēr*, clansman, OChurch Slav *bratrŭ*, OPruss *bratis*, Lith. *brŭlis*, Ir. Gael *brathair*, Corn. *bradar*, Skt *bhātar*, Goth *brōþar*, OHG. *bruodar*, Ger *Bruder*, AS. *brōþor*, Eng *brother*), AMERICAN COLLEGE Societies of students found in nearly all the colleges and universities of the United States. In general they are secret in character, but this secrecy is largely nominal, consisting chiefly of extreme care in protecting their constitutions, mottoes, and grips from outside knowledge and in holding secret meetings. Aside from this they do not cultivate mystery in their methods of work. The fraternities are composed of branches called "chapters," situated in the various colleges. But no fraternity has more than one chapter in any one college. Usually the students of all collegiate depart-

ments are eligible to membership, though the academic department has uniformly furnished the largest part of fraternity membership. Fraternities are variously termed by outsiders "Greek-Letter Fraternities" and "College Secret Societies," but among themselves the term "Fraternities" is universally used.

Nomenclature The Greek alphabet is generally employed to name both the fraternity and the chapter. Usually a Greek letter is assigned to a chapter according to the order of its establishment, but in some fraternities the name of the State may be added, and less frequently the chapter takes its name from the college or town in which it is placed. In one professional fraternity the chapters are named after some prominent individual. When chapters have used all the letters of the alphabet, it is customary to start anew, and add the word "deuteron" to the letter, thus signifying second. The badges of the fraternities are of three types. One is a plate of gold, which displays the fraternity name and one or more symbols of special significance. A second form is a monogram of the letters of the fraternity, while the third is a symbol, as a key, a skull, or a scroll.

Origin, etc. The first Greek-letter society, Phi Beta Kappa, was organized at the College of William and Mary in 1776. "The promotion of literature and of friendly intercourse among scholars" was its given object. In December, 1779, branches were authorized at Yale and Harvard, and in 1780 the meetings of the parent chapter ended amid the vicissitudes of the Revolution. The Yale chapter was established in 1780 and that at Harvard in 1781. In 1787 these two chapters united to found a chapter at Dartmouth College. It continued as a secret fraternity until 1831, since when it has become an honorary organization, and membership is gained only by high scholarship and given only to honor men, usually of graduating classes. (See PHI BETA KAPPA.) Similar in character to the foregoing but selecting its members from among those who have achieved distinction in scientific studies is Sigma Xi, founded at Cornell in 1886 and Tau Beta Pi, organized in Lehigh in June, 1885, which exists in technical and scientific departments only and elects to membership students of high standing in applied science. There are many local honorary fraternities, such as Pi Beta Nu at Minnesota, Lambda Sigma Eta at Maine, and Alpha Theta Phi at North Carolina. In 1821 a literary society was founded in Yale, called Chi Delta Theta. Other literary societies were organized, in which might be mastered the art of debate, and in which oratory might be indulged in before an audience of college mates. These literary societies have served no mean part in college life, and they have had faculty approbation and encouragement, but their literary contests and election rivalries prevented any deep fraternal interest in them. The fraternity system, as it now exists, originated at Union in 1825, when Kappa Alpha, the first of men's general fraternities, was established. It imitated Phi Beta Kappa in its secrecy, in its Greek title, and in its limitation of membership to upper-class men. The start of the fraternity system was very simple. But its novelty was so marked that it at once aroused opposition on the part of the faculty. That attitude has now, however, almost entirely changed. In 1827 Sigma Phi and Delta Phi were established at Union. In

1831 Sigma Phi placed the first secret fraternity chapter at Hamilton College, and this move probably led to the foundation in 1832 of Alpha Delta Phi at Hamilton, which fraternity then founded its second chapter at Miami University in 1835. Meanwhile, in 1833, Psi Upsilon was established at Union and Delta Upsilon (originally nonsecret) at Williams in 1834. Prior to this expansion the fraternity system was confined to two States, New York and Massachusetts, and to the three colleges, Union, Hamilton, and Williams. At Miami in 1839 Beta Theta Pi, the first Western fraternity, was founded. Delta Kappa Epsilon was founded at Yale in 1844, Zeta Psi at New York University in 1846, and Delta Psi at Columbia and New York University a year later. In 1848 Phi Gamma Delta was founded at Washington and Jefferson, Phi Delta Theta at Miami, and Theta Delta Chi at Union. In 1852 Phi Kappa Psi, one of the larger fraternities, was founded at Washington and Jefferson, and in the West Sigma Chi came into existence at Miami in 1855. The oldest of the surviving southern fraternities is Sigma Alpha Epsilon, which was founded at the University of Alabama in 1856, and in 1859 Delta Tau Delta was organized at Bethany. During the Civil War there was diminished activity in college life, but with the close of hostilities came renewed interest, especially in the South, where in 1865 Alpha Tau Omega was founded at Virginia Military Institute, and Kappa Alpha (South) at Washington and Lee. In 1869 Kappa Sigma was organized at the University of Virginia and Sigma Nu at Virginia Military Institute. Among the smaller fraternities are the following: Chi Phi, originally organized at Princeton in 1824, Chi Psi, founded at Union in 1841, Phi Kappa Sigma, founded at the University of Pennsylvania in 1850, Theta Chi, organized at Norwich University in 1856, Theta Xi (scientific), founded at Rensselaer Polytechnic Institute in 1864, Pi Kappa Alpha, organized at the University of Virginia in 1868, Phi Sigma Kappa, organized at Massachusetts Agricultural College in 1873, Alpha Chi Rho, founded at Trinity in 1895, Delta Sigma Phi, founded at College of the City of New York, and Sigma Phi Epsilon, organized in Richmond College in 1901. Since that time the system has spread, both by the establishment of chapters in various colleges and by the organization of new fraternities, until in 1914 there were 38 leading fraternities, with a total membership of 2,656,817 distributed among 1228 active chapters, possessing 979 fraternity houses. The advent of the fraternity system hurt the prestige of the literary societies through competition for membership and in other ways, and on that account four literary societies met in convention in 1847 and formed the "Anti-Secret Confederation." In 1858 a fraternity was effected out of this confederation, changing its status and adopting the monogram badge of Delta Upsilon. In time Delta Upsilon became only nominally nonsecret and now ranks with other secret fraternities.

Women's Fraternities The women's fraternities followed naturally upon the opening of colleges to coeducation, and as young women came to participate more and more in college life, to live in dormitories, and take up college residence. The first of these sororities was the Kappa Alpha Theta, founded at De Pauw in 1870. The second, Kappa Kappa Gamma, was founded at Monmouth in the same year. The

Delta Gamma started at the University of Mississippi, and the Alpha Phi was also installed in 1872 at Syracuse. The Gamma Phi Beta was launched at Syracuse in 1874. The Delta Delta Delta was organized at Boston University in 1888, and the Pi Beta Phi (originally I C Sorosis) was founded at Monmouth in 1867. Besides the foregoing there are the smaller sororities of Sigma Kappa, founded at Colby in 1874, Alpha Chi Omega, founded at De Pauw in 1885, Beta Sigma Omicron, founded at Missouri State in 1888, Alpha Xi Delta, founded at Lombard in 1893, the Omega, founded at Arkansas in 1895, Alpha Omicron Pi, founded at Barnard, and Kappa Delta at Virginia Normal in 1897, Sigma Sigma Sigma and Zeta Tau Alpha at Virginia Normal in 1898, and Delta Sigma at Brown in 1901. These sororities have a total membership of 48,176 distributed among 395 chapters. They are practically identical in aims and purposes with the men's fraternities, and in colleges where houses are owned by sororities their general similarity as part of the college organization is marked.

Professional Fraternities There are now fraternities in which membership is restricted to those who are connected with some special profession. These include 16 medical fraternities, one of which is honorary, i.e., requires high scholarship for admission, 4 legal, also dental, engineering, and pharmaceutical fraternities. In all there are about 50 professional fraternities with a membership exceeding 40,000 persons. There are also certain undergraduate fraternities in which membership is extended only to those who are following some special subject, as, e.g., Phi Lambda Upsilon, which admits only students of chemistry. Members of professional fraternities may also belong to the general college fraternities.

Local Fraternities Local fraternities are many and important. They now number about 75, with a membership of about 10,000. Those at Yale University are the most widely known. They are senior societies and are three in number. Skull and Bones (1832), Scroll and Key (1841), Wolf's Head (1884). They always elect 15 men in each year, have no electioneering or pledging, but until recently offered their elections on the campus on a certain date of each year (called "tap day") in an impressive manner in the presence of the student body.

Organization, etc. Prior to 1861 the government of a fraternity was usually retained as a heritage by one chapter, but was modified at times by the several chapters assembled in convention. The year 1870 is generally accepted as the date of a solidified system. In general, the legislative power of fraternities has been vested in an annual convention of delegates, while the administration has been placed upon a few officers there elected.

Social life forms the basic *raison d'être* of all fraternities. They seek as members those who promise to contribute most to a fellowship where social equality, good scholarship, athletic abilities, and mutual helpfulness are assured.

Naturally the contest for members is intense. In general this campaign is the great student feature of the beginning of each college year. The chapter house is the most notable part of fraternity life. Statistics show that there were in 1883 but 33 houses owned and occupied by the general fraternities. In 1914, 1128 houses were owned or occupied by the national, local,

and women's fraternities of the United States. Of these 979 were owned by the men's fraternities, and 149 owned by the sororities. This great increase is instructive, illustrating the growth of fraternities in recent years.

Fraternity members are styled "active" when in actual college attendance, "alumni" afterward. Should they be elected while not undergraduates, they are termed honorary members. To bestow honorary membership is, however, at the present time generally discountenanced. Most fraternities publish catalogues, song books, and magazines. The catalogues generally contain addresses of members, the rolls of chapters, and tables of varied statistics, including a table showing the geographical distribution of chapters and members. Histories have been issued by some of the fraternities. The song books have special music in addition to usual college songs, with words written by members. The periodicals are an important factor in the fraternity life and are published by many of the fraternities, including sororities.

The legal status of fraternities has in several cases been in litigation. In one case, hinging upon the right of a college faculty to debar a student because of his fraternity membership, the Supreme Court of Indiana (1881) decided "There is no doubt whatever that if an applicant for admission into a public college is otherwise qualified, and there is room to receive him, he cannot be denied admission by reason of membership in a college fraternity." And the court held further that the requiring by the faculty of a written pledge from the student that he would not join a fraternity, as a condition precedent to his matriculation, implied discrimination against a class of inhabitants of the State. On the other hand, it appears to be established that a privately endowed and managed college may exact and enforce such a pledge. One of the most important cases that has been recently decided, at least from a theoretical point of view, and involving the internal organization and powers of a fraternity, was that of the Kappa Kappa Gamma Society *versus* certain members of its Grand Council. The Grand Council had endeavored to withdraw, without its consent, its Beta Beta chapter, and suits to restrain the Council, through the individual members thereof, were instituted in New York and Massachusetts. The Massachusetts court dismissed the suit on the ground that no property right was involved, but the New York courts held, on appeal, among other things, that the publication of *fraternity suits* by the Beta Beta chapter had been proper, inasmuch as the fraternity had virtually compelled it, that rights were affected for which a court of equity could give remedy, and that the fraternity should, on the facts presented, be restrained from withdrawing its chapter. Consult Baird, *American College Fraternities* (New York, 1912), Kellogg, *College Secret Societies* (Chicago, 1874), Aiken, *The Secret Society System* (New Haven, 1882), Heckethorn, *Secret Societies of all Ages and Countries* (new ed., London, 1897), Maxwell, *Greek Letter Men of New York* (New York, 1899), Stevens, *Cyclopædia of Fraternities* (2d ed., ib., 1907). For Plate of fraternity badge, see SOCIETIES, see also COLLEGES, AMERICAN.

FRATICELLIANS, frăt'i-sěl'i-anz or fra'tě-chěl'lē-anz, or **FRATICELLI**, -sěl'ī or -chěl'lē (It., ML *fraticelli*, little brethren, dim of Lat

frater, brother). A name applied to various more or less strictly defined heretical sects of the fourteenth and fifteenth centuries, mostly in Italy, not closely connected either by their beliefs and tendencies or by their time. Their general tendency was one of protest against the existing ecclesiastical and social order, and there is little to distinguish them, to the modern mind, from the Albigenses, Waldenses, Catharini, Beghards, and Brethren of the Free Spirit. The name is found as early as the beginning of the fourteenth century, e.g., in the chronicle of Giovanni Villani. The origin of the Fraticelli proper has often been connected with a particularly strict and rigorist party within the Franciscan Order. This theory is supported by the fact that this name was common in Italy to designate the Friars Minor, but it seems much more likely that, as the immense popularity of the Franciscan Order produced a multitude of unauthorized imitations of it, these innovations in doctrine found ready acceptance in such groups, unrestrained as they were by any close oversight of ecclesiastical authority. One group which bore this name may be traced to Gherardo Segarelli, a laboring man of Parma, and his disciple, Dolcino of Novara, who organized their followers as an "apostolic order," and made considerable noise in Upper Italy from 1260 to 1307. They declared poverty an absolutely essential condition of belonging to the true Church, and regarded the existing Church as in a state of apostasy. They had no fixed domiciles, but wandered from place to place. They were not bound by any definite rule, and were charged with "free-love" excesses. The adherents of Segarelli and Dolcino held that all authority was forfeited by sin and proceeded to fill all the offices which, on their hypothesis, were vacant, electing a certain Majoretta Emperor, a secular priest named Rinaldo Pope, and choosing archbishops of Florence and Venice and a general of the Franciscans who did not even belong to the order. They were gradually suppressed in the course of the first half of the fifteenth century. John Capistrano was commissioned as inquisitor general in their regard by Martin V, Eugenius IV, and Nicholas V, and succeeded in completing their eradication. Their last pseudo-pope was burned at Fabriano in 1449, and the sect disappears from history with him. For the sake of clearness, it would be well to restrict the name 'Fraticelli' to the sect above described, but it is sometimes given to the rigorist Franciscans, who tried to keep the order strictly to the original rule of poverty, and to the followers of Michael of Cesena, who taught that Christ and His disciples possessed no property. Consult Dollinger, *Beiträge zur Sektengeschichte des Mittelalters* (Munich, 1890), and Lea, *History of the Inquisition* (New York, 1907), and see FRANCISCANS.

FRATRES ARVALES. See ARVAL BROTHERS.

FRATRES CALENDARII. See CALAND **FRATTAMAGGIORE**, frat'ta-ma-jō'rā. A city in the Province of Naples, south Italy, 8 miles north of Naples, with a fine parish church, silk and rope factories, and numerous country houses of rich Neapolitans. Pop. (commune), 1901, 13,170, 1911, 13,720.

FRAUD. In its broadest sense, any variety of falsehood or artifice by which one deceives another to his legal injury. Courts have been

of the Canton of Thurgau, Switzerland, situated in a beautiful and fertile district on the Murg, 25 miles northeast of Zurich (Map Switzerland, C 1). It is regularly built and has among its buildings a Catholic church dating from 1286 and an old castle, the government building, containing the cantonal archives and library, the town hall, and the military barracks. There is a technical school with scientific and historical collections. The town manufactures gloves, cotton and iron goods, guns, machinery and leather, and is also a centre of trade for wine, fruit, and agricultural products. From 1712 to 1798 the town was the capital of the Swiss Confederation. Pop. (commune), 1900, 7861, 1910, 8105, mainly Protestants.

FRAUENLOB, frau'en-löp (Ger., ladies' praise) (c 1250-1318). The assumed name of Heinrich von Meissen, one of the German minnesingers (qv). After years of wandering as a minstrel, he is said to have established the first school of early mastersingers (see MEISTERSINGER) in Mainz. In token of appreciation for his chivalrous devotion to "ladyhood," ladies of Mainz are said to have borne his body to the grave in the cathedral. During the Werther period of German literature ladies restored his tombstone in 1783, and near it other ladies, in 1842, erected a beautiful monument. Frauenlob's bombastic and artificial poems, striving to appear erudite, have been edited by Ettmüller (1843), and his *Cantica Cantorum* has been translated into English.

FRAUENSTADT, frau'en-stët, CHRISTIAN MARTIN JULIUS (1813-79). A German philosopher, born at Bojanowo, Province of Posen, Prussia. He studied theology and philosophy at Berlin, and became one of the most ardent disciples of Arthur Schopenhauer. Many of his works reflect the influence of that thinker, whose ideas Frauenstadt extends, but frequently also modifies. Some of his more important works are *Die Naturwissenschaft in ihrem Einfluss auf Poesie, Religion, Moral und Philosophie* (1855), *Neue Briefe über die schopenhauersche Philosophie* (1876), *A Schopenhauer Lichtstrahlen aus seinen Werken* (7th ed., 1891). He also edited the first complete edition of Schopenhauer's collected works (1873-74).

FRAUNCES'S (fran'séz) **TAVERN**. One of the oldest buildings of New York City, at the southeast corner of Broad and Pearl streets, originally a mansion of the Delanceys and subsequently transformed into a tavern. Washington made it his headquarters after the British evacuation of New York and in it took farewell of his officers on Dec 4, 1783. The New York Chamber of Commerce was organized in it in 1768. In 1902 it was purchased and restored by the Sons of the Revolution.

FRAUNHOFER, frau'n'hö-fër, JOSEPH VON (1787-1826). A distinguished Bavarian optician and physicist, born at Straubing. In 1799 he was apprenticed to a glass cutter in Munich, and in 1806 was received, as a working optician, into the establishment of Reichenbach & Utzschneider at Benedictbeuern, of which he later became the head, and which afterward, in 1819, was removed to Munich. While there he acquired considerable wealth and reputation through his inventions, and soon afterward became proprietor of the establishment. He was especially successful in producing large pieces of optical glass free from imperfections, which could be used for prisms and lenses, and as he

combined the mechanical skill and technique of the optician with the theoretical knowledge and mathematical training of the physicist, his instruments were always in demand. He invented a machine for polishing parabolic surfaces, and was the first one who succeeded in polishing lenses and mirrors without altering their curvature. Prisms made under his direction were celebrated for being free from inequalities and striae. His inventions are numerous and include a heliometer, a micrometer, an achromatic microscope, besides the great refracting telescope at Dorpat. But that which has rendered Fraunhofer's name celebrated throughout the scientific world is his discovery of the dark lines in the spectrum, which are now known by his name (See SPECTROSCOPY). He was the first to obtain a spectrum from a grating (see DIFFRACTION AND DIFFRACTION GRATINGS), and with this apparatus was able to measure the wave length of sodium light. Fraunhofer was a diligent student and investigator as well as a successful instrument maker, and was elected a member of the Munich Academy of Sciences (1817), and five years later became conservator of its physical cabinet.

FRAUNHOFER LINES. See SPECTROSCOPY.

FRAUXINEL/LA. See DITTANY.

FRAUXINUS. See ASII.

FRAY BENTOS. See INDEPENDENCIA.

FRAY GERUNDIO, fra'è hà-ròon'dè-ò. See LAFUENTE, MODESTO.

FRAY GERUNDIO DE CAMPAZAS, dà kam-pa'thas. A romance by Isla (1758), satirizing the degraded type of pulpit oratory of the period in Spain.

FRAYSSINOU, frà'sè-nòos', DENIS ANTOINE LUC, COUNT DE (1765-1841). A French prelate, born at Curières, Aveyron. He became known at Paris for his conferences at the church of St Sulpice (in 1803-09, thereafter prohibited by Napoleon), and in 1816 he was appointed court preacher and first almoner to Louis XVIII. In 1824-28 he was Minister of Public Worship, and during these years the Jesuits were recalled and Frayssinou became a peer of France. He was elected to the Academy in 1822. He was compelled to leave France by the July revolution, and lived in Rome and then at Prague, where he was tutor to the Comte de Chambord. In his own day his *Défense du christianisme* (3 vols., 1825) attracted great attention, passing through many editions and versions. Consult the biography by Henrion (2 vols., Paris, 1844).

FRAZER, SIR JAMES GEORGE (1854-). A British anthropologist, born in Glasgow. He became a fellow of Trinity College, Cambridge, and in 1907 professor of social anthropology at the University of Liverpool. His published works are of the utmost importance for the study of anthropology and (particularly) of religion and myth, which he relates rather closely to magic. In his earlier works he followed Mannhardt in tracing to agricultural rites many religious practices and myths, and he held that many gods developed from spirits of vegetation. He was knighted in 1914. His books include *Totemism* (1887, supplemented by his article on the same subject in 9th ed of *Encyclopædia Britannica*), *The Golden Bough* (1890, 3d ed., 1913); *Pausanias's Description of Greece* (1898, 2d ed., 1913), *Pausanias and Other Greek Sketches* (1900); *Early History of the Kingship* (1905), *Adonis, Attis, Osiris*

(1906, 2d ed, 1907), *Psyche's Task* (1909, 2d ed, 1913), *Totemism and Exogamy* (1910), *The Magic Art and the Evolution of Kings* (1911), *Taboo and the Perils of the Soul* (1911), *The Dying God* (1911), *Spirits of the Corn and of the Wild* (1912), *The Scapegoat* (1913), *The Belief in Immortality* (vol 1, 1913), *Balder the Beautiful* (1913)

FRAZER, JOHN FRIES (1812-72) An American scientist, born in Philadelphia, Pa. He graduated in 1830 at the University of Pennsylvania, in 1836 was appointed first assistant geologist in the first geological survey of Pennsylvania, and from 1837 to 1844 was instructor in chemistry and natural philosophy at the Philadelphia high school. From 1844 until his death he was professor of natural history and philosophy in the University of Pennsylvania. He was also vice provost of the university in 1855-68. For some time he was connected with the Franklin Institute as a lecturer. He also edited the *Journal* of the Institute and to it contributed several papers, which constitute the most important part of his published writings. He was elected to the American Philosophical Society in 1842, and in 1863 became a charter member of the National Academy of Sciences.

FRAZER, PERSIFOR (1844-1909) An American geologist, born in Philadelphia, Pa. He graduated at the University of Pennsylvania in 1862, was an aid on the United States Coast Survey in 1862-63, served as acting ensign in the Mississippi squadron in 1863-65, and from 1866 to 1869 studied in the School of Mines at Freiberg, Saxony. In 1869-70 he was mineralogist and metallurgist on the United States Geological Survey, in 1870-74 was professor of chemistry in the University of Pennsylvania, and from 1874 to 1882 was assistant in connection with the second geological survey of Pennsylvania. He received the degree of *Docteur-ès-Sciences Naturelles* from the Université de France, being the first person, not a native of France, to whom this degree was ever awarded. Among his contributions to science may be cited his explanation of the cause of the white color of the moon as observed by day. He was elected to the American Philosophical Society in 1871. His publications include, in addition to four volumes of reports of the second geological survey of Pennsylvania, *Tables for the Determination of Minerals* (1874) and *Bibliotics, or the Study of Documents* (3 eds, 1894-1901). In 1905 he received from the city of Philadelphia the John Scott medal for contributions to the science of bibliotics.

FRAZIER'S or FRAYSER'S FARM, BATTLE OF, also called the **BATTLE OF GLENDALE**, the **BATTLE OF CHARLES CITY CROSS ROADS**, and the **BATTLE OF NELSON'S FARM**. A battle fought at Glendale, Va., about 12 miles southeast of Richmond, on June 30, 1862, during the Civil War, between a Federal force under General McClellan and a Confederate force under Generals Longstreet and Hill. The losses were about 1800 on the Federal and about 2000 on the Confederate side.

FREAR, WALTER FRANCIS (1863-). An American public official, born at Grass Valley, Cal. He graduated from Oahu College, Honolulu, Hawaiian Islands, in 1881, from Yale University in 1885, and from Yale Law School in 1890. In 1886-88 he taught Greek, mathematics, and economics at Oahu College. He was second judge of the first circuit under the

Kingdom of Hawaii in 1893, second associate justice of the Supreme Court under the Provisional Government of Hawaii in the same year, first associate justice of the Supreme Court of the Republic of Hawaii in 1896, and Chief Justice from 1900 to 1907, after annexation to the United States. He also served on the Hawaiian commission to recommend legislation regarding Hawaii to the United States Congress, and in 1903-05 was chairman of the Hawaiian Code Commission. From 1907 to 1913 he was Governor of Hawaiian Territory.

FREAR, WILLIAM (1860-1922) An American agricultural chemist. He was born at Reading, Pa., graduated in 1881 from the University of Lewisburg (now Bucknell University), where he was an assistant in sciences in 1881-83, and studied also at Illinois Wesleyan University (Ph.D., 1883). He was assistant chemist in 1883-85 and special agent after 1900 of the United States Department of Agriculture, professor of agricultural chemistry (1885-1907) and of experimental agricultural chemistry (after 1907) at Pennsylvania State College, and held various important positions in connection with State agricultural work. In 1892-94 he was editor and proprietor of *Agricultural Science*. He was elected to high office in several scientific and educational associations.

FRÉCHETTE, fra'shét', LOUIS HONORÉ (1839-1908) A French-Canadian poet. He was born at Point Lévi, Province of Quebec, and was educated at the Quebec Seminary and Laval University. He was called to the bar in 1864, but was in newspaper work in Chicago during 1866-71. In the latter year he returned to Canada, and in 1874 he represented his native county in the Dominion Parliament, and practiced his profession in Quebec until 1879, when he went again into journalism and successively edited three French papers, respectively in Quebec, Montreal, and Chicago. He is the representative poet of French Canada, and his productions brought him honor from many societies, including the French Academy and the Imperial Institute, London. He was also made Knight of the Legion of Honor and was elected president of the Royal Society of Canada. His poetry is chiefly lyrical and is often inspired by intense patriotic feeling. The beauties of nature and the bonds of the family and of friendship were with him far stronger poetic motives than the passion of love. He was the first to perfect the form of French-Canadian verse. His publications include a remarkable pathetic drama, *Veronica*, and other plays, one sketch in English called *Christmas in French Canada* (1899), a few prose essays in French (*Originaux et détraqués*, 1892, and *La Noël au Canada*, 1900), translations of Howell's *Chance Acquaintance*, and Cable's *Creole Days*, but he will be best remembered by his poems *Mes loisirs* (1863), *La voix d'un exilé* (1869), *Pêlé-Mêle* (1877), *Les fleurs boréales* (1879), *Les oiseaux de neige* (1879), *La légende d'un peuple* (1887), *Les feuilles volantes* (1891). Consult Roy, "French Canadian Literature," in *Canada and its Provinces*, vol. VI (Toronto, 1914). See CANADIAN LITERATURE.

FRECKLES, frék'k'lz (older form *frecken*, from Icel *freckur*, freckles, ultimately connected with Gk *περκνός*, *perknos*, spotted), sometimes called *lento* and *ephels*. Small yellowish or brownish-yellow irregularly rounded spots, from the size of a pin's head to that of a split pea,

frequently seen on the skin, especially of fair or reddish-haired persons, though they are seen even in mulattoes. They occur most commonly during adolescence and are not often met with under the age of six or eight. They are seen usually on the face, but often occur on the hands and sometimes elsewhere. They are always most distinct in summer, but though the influence of the sun's rays undoubtedly increases their distinctness, it is doubtful whether it can cause them. They are due to increased local deposit of pigment granules in the epidermis, persons subject to them do not bronze uniformly under the influence of exposure nearly so deeply as others. Many methods of treatment have been advocated for their removal, but in most cases they return upon exposure to the sun. Among the milder measures which sometimes succeed in improving the condition is a solution of hyposulphite of soda, 15 to 30 grains, or of chloride of ammonium, 15 grains to the ounce of water. A mixture of bichloride of mercury, dilute acetic acid, borax, and rose water is generally efficacious when applied as a wash night and morning.

FREDEGAR, or **FREDEGARIIUS SCHOLASTICUS**. A chronicler of the Franks, who lived in the seventh century. He was one of the three compilers of the *Historia Francorum*, a history of the Franks down to the year 642 A.D., written in corrupt Latin, but of great value as a source for the history of France during the first half of the seventh century. During the eighth century it was continued in the so-called *Gesta Francorum*. Fredegar traced the descent of the Franks from the Trojans. Consult Kirsch, *Fredegarum et Alorum Chronica* (Hanover, 1888).

FREDEGUNDA (c. 545-597). A Frankish queen. Originally a servant of Audover, wife of Chilperic of Neustria, she soon won the King's heart and got him to put his wife in a convent and to divorce her. But Chilperic married Galswintha and put away Fredegunda. Galswintha died in the same year (567), probably strangled by Fredegunda, who succeeded her as Queen. This brought on war between Chilperic and his brother Sigebert, King of Austrasia, and a bitter rivalry between Fredegunda and Brunhilda, sister of the murdered Queen and wife of Sigebert, who was soon assassinated by Fredegunda's agents at Vitry (575). Chilperic's sons by Audover also died suddenly, and in 584 Chilperic was murdered, and contemporary historians accuse the Queen of instigating all three murders. Unsuccessful in her efforts to kill Brunhilda and her son Childebert, she made war on Austrasia after Childebert's death (595), obtained possession of Paris and other cities in 596, but died in the following year. See **BRUNHILDA**.

FREDERIC, HAROLD (1856-98). An American novelist and journalist. He was born in Utica, N. Y., Aug. 19, 1856, and was London correspondent of the *New York Times* from 1884 till his premature death in Hornby, England, Oct. 19, 1898. He was educated in Utica, worked at journalism there, in Albany, and in New York, but won distinction for novels, chiefly of rural life in central New York, written after his going to England. His first important story, *Seth's Brother's Wife* (1887), was followed by *The Lawton Girl* (1890), *In the Valley* (1890), a story of 1777, *The Return of the O'Mahoney* (1892), *The Copperhead* (1894), a story of the

Civil War, and *Marsena* (1895), a collection of keenly humorous character stories. All these, however, were surpassed by *The Damnation of Theron Ware* (1896, 1912), a brilliant analysis of religious life in the American middle class, minutely realistic in detail, clever in conversation, and unfailing in insight, immediately recognized by the public as a human document. His last works, *March Hares* (1896), *Gloria Mundi* (1898), and *In the Marketplace* (1899), were less significant. *The New Exodus* (1892) was a study of anti-Semitism, the result of a visit to Russia, undertaken in 1891.

FREDERICH, frä'de-rik, BERTHA (pseudonym, GOLO RAIMUND) (1825-82). A German novelist, born at Hanover. She was the wife of Eduard Frederich, editor of the *Hannoverscher Courier*, in which paper her first efforts appeared. In order to conceal her identity more effectually, she not only chose the above pseudonym, but managed to have the true authorship of her novels ascribed to a fictitious personage, "Georg Dannenberg." She wrote, in all, about 22 novels, nearly all of which have been republished. Among them are *Bauernleben* (3d ed., 1888), *Zwei Braute* (4th ed., 1888), *Schloss Ellersath* (3d ed., 1885), *Von Hand zu Hand* (2d ed., 1885), *Mein ist die Rache* (3d ed., 1885), *Zwei Menschenalter* (3d ed., 1886), *Ein deutsches Weib* (5th ed., 1886).

FREDERICIA, fräd'ër-is'i-a, or **FRIEDERICIA**. A seaport of Denmark, situated on the east coast of Jutland, on a projecting tongue of land, at the northern entrance to the Little Belt (Map Denmark, C 3). The town is surrounded by fortifications, now falling into ruins, and has a famous bronze statue, "The Danish Soldier," by Bissen, erected in commemoration of the victory of the Danes over the Schleswig-Holstein forces in 1849. Fredericia is connected with Middelfort, a seaside resort on the island of Funen, by steamer, has manufactures of tobacco, salt, hats, cotton goods, and chicory, and carries on a considerable trade in exports of meat, fish, eggs, and imports of pottery, salt, and petroleum. Pop., 1901, 12,714, 1911, 14,228.

FREDERICK. A city and the county seat of Frederick Co., Md., 60 miles west-northwest of Baltimore, on the Baltimore and Ohio and the Pennsylvania railroads (Map Maryland, E 2). It is situated in a beautiful and fertile valley near the famous battlefields of Monocacy and South Mountain. It is the seat of a State institution for the deaf and dumb, and of the Women's College (Reformed church), organized in 1893, and has Frederick College and St. John's Literary Institute, and Frederick City and Emergency hospitals. There are large canning establishments, brickworks, planing mills, a foundry, knitting mills, and manufactures of flour, tobacco, fibre brushes, hosiery, leather, shutter fasteners, and coaches. The government is administered under a charter of 1898 by a mayor, elected every three years, who controls the appointments to all municipal offices except that of city register, and a council elected at large. The city owns and operates its electric-light plant. Pop., 1900, 9296, 1910, 10,411, 1914 (U. S. est.), 10,886, 1920, 11,066. Frederick has been made famous by Whittier as the scene of Barbara Frietchie's exploit. Francis Scott Key, the author of "The Star-Spangled Banner," is buried in Mount Olivet Cemetery, and a splendid monument to him marks its entrance, and the remains of Roger B. Taney (q.v.)

lie in the burial grounds of the Roman Catholic church. Frederick was first settled in 1745 and was incorporated in 1817. In 1755 Washington met Braddock here to prepare for the expedition against the French. Near by Robert Strawbridge, in 1764, organized a Methodist church, "the first in Maryland and America." Consult a sketch in Powell's *Historic Towns of the Southern States* (New York, 1900)

FREDERICK A city and the county seat of Tillman Co, Okla., 150 miles southeast of Oklahoma City, on the St. Louis and San Francisco and the Wichita Falls and Northwestern railroads (Map Oklahoma, C 4) It is in a productive agricultural region and has extensive interests in cotton, cottonseed oil and cake, alfalfa, wheat and poultry The water works are owned by the city Pop., 1900, 2036, 1910, 3027.

FREDERICK (FRIEDRICH MARIA ALBRECHT WILHELM KARL) (1856-) Archduke of Austria Born at Gross-Seelowitz, near Brunn, he was a great-grandson of the Emperor Leopold II, grandson of the Archduke Charles Louis John, the great Austrian general in the campaign of 1809 against Napoleon, and a son of the Archduke Charles Ferdinand (d 1874) His sister Maria Christina married Alfonso XII of Spain In 1878 Frederick married Isabelle, Princess of Croÿ-Dulmen, who bore him one son, Albert (b 1897), and six daughters, one of whom, Isabelle Marie (b 1888), married Prince George of Bavaria in 1912 and was separated from him in 1913 The archduke's training was almost entirely military, and he became general of infantry and army inspector (1905) and commander of the Landwehr (1907) This position made him the natural successor in military matters of Prince Francis Ferdinand (qv), upon whose death he became practically chief commander of the Austro-Hungarian forces For this command in the great War of 1914 he was especially fitted by his close intimacy with the German Kaiser (See WAR IN EUROPE) His Vienna palace contains the remarkable Albertina collection of engravings and drawings.

FREDERICK, CHRISTIAN AUGUST (1829-80), Duke of Schleswig-Holstein-Sonderburg-Augustenburg, and claimant to the duchies of Schleswig and Holstein He was born on the island of Alsen and was educated at Bonn After the unsuccessful revolt of Schleswig-Holstein against Danish rule the ducal family was banished Frederick was very popular, however, and when, after the War of 1864, the rule of Denmark in the duchies was terminated, he triumphantly entered Kiel But political complications prevented the formal reinstatement of the dynasty By the Treaty of Vienna (October, 1864), the duchies had been relinquished to Prussia and Austria, to be disposed of by them Prussia was not inclined to permit the creation of a new German state and imposed conditions upon Frederick which made it impossible for him to assume the government After the Peace of Prague, which terminated the Austro-Prussian War of 1866, the lands were finally absorbed into the Kingdom of Prussia Frederick served on the staff of the Crown Prince, Frederick William of Prussia, during the Franco-German War of 1870-71 His daughter, Augusta Victoria, became the wife of Emperor William II of Germany Consult Samwer, *Herzog Friedrich* (Wiesbaden, 1900)

FREDERICK I (c 1121-90) Holy Roman

Emperor from 1152 to 1190, surnamed Barbarossa or Redbeard He succeeded his father, Frederick, as Duke of Swabia, in 1147, and his uncle, Conrad III, as King of Germany, in 1152 On his father's side he belonged to the Hohenstaufen family, on his mother's side to the Guelphs In the early years of his reign Frederick reduced Germany to order and then proceeded to reestablish the Imperial authority in Italy The Lombard cities, with Milan at their head, flourishing and powerful, and strengthened by the papal power in their opposition to the Imperial pretensions, were prepared to resist Frederick's attempt to subjugate them After receiving the Lombard crown at Pavia, Frederick marched in 1155 to Rome, reinstated the authority of Pope Adrian IV, to whom he delivered up Arnold of Brescia, and was crowned Holy Roman Emperor In 1158 he besieged and took Milan In the same year, after a diet held at Roncaglia, Frederick attempted to establish his rule firmly over the Lombard cities Although the cities submitted for the moment, they soon rebelled In 1159 began the long contest between Frederick Barbarossa and Pope Alexander III, the successor to Adrian IV The Emperor created an antipope in the person of Victor IV, the first of several antipopes set up by him The city of Crema was reduced by Frederick after a long siege in 1160, and in 1161-62 he besieged and took Milan and razed it to the ground Frederick was triumphant everywhere, but in 1167 the Lombard cities formed a league against him and renewed the struggle Frederick was completely defeated at Legnano in 1176, and in 1183, in a peace concluded at Constance, he finally agreed to leave the Lombard cities the right to choose their own municipal rulers and to conclude treaties and leagues among themselves, although he retained his suzerainty over them, together with the power of imposing certain fixed taxes The difficulty of settling the Italian differences had been aggravated by the attitude of Pope Alexander III At last, in 1177, Frederick made his peace with the Pope and was enabled to turn his attention to Germany, where he had to contend with Henry the Lion (qv), Duke of Bavaria and Saxony, the powerful head of the house of Guelph By his energetic measures Frederick succeeded in thoroughly humbling his troublesome vassal and crushing the Guelph power in Germany In 1189, having settled the affairs of the Empire and proclaimed universal peace in his dominions, he resigned the government to his eldest son, Henry, and at the head of a large army set forth for the Holy Land After gaining two great victories over the Moslems at Philomelum and Iconium, he was drowned in the Calycadnus a small stream in Cilicia (1190) His remains were rescued by his son and buried at Tyre The death of Frederick, which led to the dispersion of the Crusaders before any material advantage had been obtained over the infidels, excited the deepest grief in Germany, where his memory has always been cherished as that of the best and greatest of his race Frederick made Poland tributary to the Empire, raised Bohemia to the rank of a kingdom, and erected the Margraviate of Austria into an independent hereditary duchy He was a patron of learning and enacted many admirable laws, some of which were based upon the Roman law Consult Prutz, *Kaiser Friedrich I* (3 vols, Danzig, 1871-74), Fischer, *Kreuzzug Friedrichs I* (Leipzig,

1870), Giesebrecht, *Geschichte der deutschen Kaiserzeit*, vols v-vi (ib, 1888-95), Jastrow and Winter, *Deutsche Geschichte im Zeitalter der Hohenstaufen* (2 vols, Stuttgart, 1897-1901), for a complete bibliography, see Dahlmann-Waitz, *Quellenkunde der deutschen Geschichte* Nos 5240-5323 (8th ed, Leipzig, 1912)

FREDERICK II (1194-1250) King of Sicily from 1198 and Holy Roman Emperor from 1215 to 1250. He was a grandson of Frederick I and the son of the Emperor Henry VI and of Constance, heiress of Sicily. He was born at Jesi, near Ancona, in Italy, Dec 26, 1194. His mother secured the favor of Pope Innocent III for her infant son by conceding many important privileges to the papal chair, and on the death of Constance, in 1198, the Pope became the guardian of the young Prince. As early as 1208 Frederick assumed the reins of government in his realm, which included south Italy in addition to Sicily. Supported by the Pope, Frederick, in 1212, engaged in a contest for the Imperial throne of Germany, with Otho IV, who had as yet not succeeded in securing himself in its possession after his long struggle with the rival claimant, Philip of Swabia, assassinated by Otho of Wittelsbach, in 1208. The blow dealt to Otho IV by Philip Augustus of France in 1214, in the battle of Bouvines, secured the triumph of Frederick, who was crowned at Aix-la-Chapelle in 1215. On his coronation Frederick took a vow to go on a crusade. Having secured the election of his son Henry as King of the Romans, and leaving Archbishop Engelbert of Cologne as his vicerent, he went to Italy and was crowned Emperor at Rome, by Pope Honorius, in 1220. Frederick now devoted himself to the task of organizing his Italian territories. He founded the University of Naples, gave encouragement to the medical school of Salerno, invited to his court men of learning, poets, and artists, and commissioned his chancellor, Petrus de Vineis, to draw up a code of laws. Frederick, however, was hampered in his projects by the refractory conduct of the Lombard cities, which in 1226 renewed the league formed against Frederick Barbarossa, and still more by the opposition of the popes. As he delayed going on a crusade, he was threatened with excommunication unless he fulfilled his pledge. Being compelled to depart on this expedition, he made the necessary preparations for its prosecution and actually started in 1227. He returned in three days, saying that he was ill, whereupon Gregory IX, the successor to Honorius III, excommunicated him. In 1228 Frederick again set out for the Holy Land. This second expedition proved successful, and in 1229 Frederick made a 10 years' truce with the Sultan of Egypt, who gave up Jerusalem and the territory around Jaffa and Nazareth, Frederick crowning himself King of Jerusalem. The rest of his life was spent in attempting to bring his rebellious Lombard subjects to subjection and in struggles with Popes Gregory IX and Innocent IV, who had both excommunicated him. He died suddenly in 1250. Frederick II was famed for his talents and for his varied learning, he gathered scholars and men of letters about him. Some excellent poetry, highly praised by Dante, was written at his court. He was tolerant in matters of religion and in his reforms showed himself far in advance of his time. His strong sympathies with his Italian motherland and his unremitting endeavors to establish a compact and all-supreme

empire in Italy were the causes, not only of his own misfortunes, but of the miseries which he brought upon Germany, for, by embroiling him in costly wars abroad, they led him to neglect the welfare of his German subjects. Consult Huillard-Bréholles, *Historia Diplomatica Frederici Secundi* (12 vols, Paris, 1852-61), Jastrow and Winter, *Deutsche Geschichte im Zeitalter der Hohenstaufen* (2 vols, Stuttgart, 1897-1901), Winkelmann, *Kaiser Friedrich II* (2 vols, Leipzig, 1889-97), Hampe, "Kaiser Friedrich II" in *Historische Zeitschrift*, vol lxxxiii (Munich, 1900), Allshorn, *Stupor Mundi The Life and Times of Frederick II* (London, 1912). For a fuller bibliography, see Dahlmann-Waitz, *Quellenkunde der deutschen Geschichte* (8th ed, Leipzig, 1912), Blondel, *Etude sur la politique de l'empereur Frédéric II en Allemagne* (Paris, 1892), Folz, *Kaiser Friedrich II und Papst Innocenz IV* (Strassburg, 1905). See HOHENSTAUFEN.

FREDERICK III (1415-93) Holy Roman Emperor from 1440 to 1493, as German King, Frederick IV. He was the son of Ernest, Duke of Austria, and was born Sept 21, 1415. After the death of the Emperor Albert II, in 1439, he was elected his successor in 1440, and two years afterward he was solemnly crowned at Aix-la-Chapelle. Ten years later he received the Imperial crown at the hands of the Pope. In the Concordat of Vienna with the papacy, concluded in 1448, in the bringing about of which the Emperor's adviser, Aeneas Sylvius (the future Pius II), had an important share, the church in Germany sacrificed the advantages obtained by the restrictions imposed upon papal authority at the Council of Basel. Frederick's only desire was to increase the hereditary possessions of his house. He failed to get the crown of Hungary, to which he laid claim, and even lost possession of Austria for a time, Vienna itself falling into the hands of the Hungarian King, Matthias Corvinus. He did nothing to check the progress of the Turks. He died in 1493, after an inglorious reign of 53 years. In 1477 he married his son and successor Maximilian to Mary, the heiress of Charles the Bold of Burgundy. In 1486 Maximilian was elected King of the Romans, and Frederick had to resign the government to him. From his time the Imperial dignity continued permanently in the house of Austria. Consult Aeneas Sylvius, *Historia Rerum Frederici III* (Strassburg, 1685), Coxe, *House of Austria*, vol 1 (4th ed, London, 1864), Bachmann, *Deutsche Reichsgeschichte im Zeitalter Friedrichs III und Maximilian I* (2 vols, Leipzig, 1884-94).

FREDERICK I (1371-1440) First Elector of Brandenburg, of the house of Hohenzollern, successor (1398) of his father, Frederick V, Burgrave of Nuremberg. He served in the Hungarian army and rescued King Sigismund at the battle of Nicopolis (1396). In 1401 he married Elizabeth of Bavaria. For the support which he gave to Sigismund as candidate for the Imperial crown, he was invested in 1417 with the electoral dignity in Brandenburg (of which he had been administrator for seven years), thus becoming the founder of the royal Prussian dynasty. Frederick quarreled with Sigismund in 1423. He sold his rights as Burgrave of Nuremberg to the city in 1427. In 1438 he was a candidate for the throne of Germany. Consult Brandenburg, *König Sigismund und Kurfürst Friedrich I* (Berlin, 1891).

FREDERICK III, ELECTOR OF BRANDENBURG See **FREDERICK I**, King of Prussia

FREDERICK I (c 1471-1533) King of Denmark and Norway from 1523 to 1533 With his elder brother John he was joint ruler of the duchies of Schleswig and Holstein at the time his nephew Christian II was dethroned (1523) Frederick was elected to succeed him A long war, waged for the possession of Norway, ended in his favor (1524) He showed great cruelty to his unfortunate relative, whom he detained in close captivity, but he was an able ruler He embraced the Lutheran faith, which spread in his dominions He granted the nobility many privileges at the cost of the power of the throne He also lost much of his control over cities, especially the seaport towns

FREDERICK II (1534-88). King of Denmark and Norway, son of Christian III He was born at Hadersleben and succeeded to the throne when only two years old Under his reign the independent Ditmarsh Republic in West Holstein was conquered in 1559, from 1563 to 1570 he was at war with Sweden During the period of peace that closed his reign he suppressed piracy on the North and Baltic seas, erected the fortress of Kronborg, and by his ability and upright life greatly endeared himself to his subjects Consult *Danmarks Riges Historie* (3 vols., Copenhagen, 1897-1905)

FREDERICK III (1609-70) King of Denmark from 1648 to 1670 He was the son of King Christian IV and was born in Hadersleben He was made Archbishop of Bremen in 1634 and Bishop of Verden in 1635 On the death of his father, in 1648, he became King of Denmark and Norway The country had been reduced by war to a state of great misery, but Frederick nevertheless plunged into a struggle with Sweden (1657) in the hope of regaining the provinces which had been lost by the Treaty of Bromsebro in 1645 Poland, Brandenburg, and Holland were his allies Charles X of Sweden invaded Jutland, overran Funen and Zealand, and forced Frederick to sign the Treaty of Roeskilde, Feb. 28, 1658, by which a number of the Danish islands and a portion of Norway were ceded to Sweden Hostilities were resumed by the Swedes in the same year, but Frederick, with the aid of Brandenburg, succeeded in expelling the Swedes from Jutland, and Charles X was compelled to raise the siege of Copenhagen in 1659 Abandoned, however, by his allies, Frederick was forced to conclude peace in 1660 on the most unfavorable terms, being obliged to relinquish all claims to the territories which Denmark had possessed in the Swedish part of the Scandinavian peninsula In the latter part of his reign the nature of the government was changed to an hereditary and absolute monarchy by the voluntary act of the commons and clergy. In 1666-67 he fought a war, of minor importance only, with England In 1667 he added Oldenburg and Delmenhorst to his realm Consult *Land, Kong Frederik III's Somagt* (Odense, 1896)

FREDERICK V (1723-66). King of Denmark from 1746 to 1766 He was the son and successor of Christian VI and one of the best and wisest of the absolute monarchs of his time With the exception of a threatened attack by Peter III of Russia, nothing disturbed the peace of his reign, owing to the skill of his Minister, Bernstorff Denmark owed to him the increase of her national wealth and the encouragement of various branches of commerce

and manufacture Frederick established the Asiatic Company, opened the American colonial trade to all his subjects, founded the military academy of Sorø in Denmark, and caused schools to be opened at Bergen and Trondhjem in Norway for the instruction of the Laplanders He established academies of painting and sculpture at Copenhagen and introduced the culture which was prevalent in Europe at this time into his own court

FREDERICK VI (1768-1839) King of Denmark from 1808 to 1839 and of Norway from 1808 to 1814 He was the son of Christian VII and Caroline Matilda of England, and assumed the regency in 1784, on account of the insanity of his father, on whose death, in 1808, he ascended the throne He himself was a semi idiot, but nevertheless his reign is one of the most eventful in Danish history During his reign serfdom was abolished in Denmark and Schleswig-Holstein, monopolies were abrogated, the criminal code was amended and the slave trade prohibited, the Jews received civil rights, and freedom of the press was granted All this was largely the work of Frederick's great Minister, Bernstorff (qv) In 1800 Denmark joined the armed neutrality of the North, formed against England by Russia, Sweden, and Prussia This led to the seizure by England of all Danish vessels in British ports, and to the dispatch of a powerful fleet, under Sir Hyde Parker and Nelson, to force the Regent to withdraw from the convention His refusal was followed by a fierce naval engagement at Copenhagen (April 2, 1801), in which the Danish fleet was almost wholly destroyed without even a declaration of war A peace was concluded on the Regent's withdrawal from the confederation, but in consequence of his persistence in maintaining an attitude of neutrality, instead of combining with Great Britain against Napoleon, the war was renewed in 1807 by the appearance before Copenhagen of a British fleet Copenhagen was bombarded for three days (September 2-5), the arsenals and docks destroyed, and all the shipping disabled, sunk, or carried to England This blow paralyzed the national resources and brought ruin on the country In retaliation Frederick became the ally of Napoleon and suffered in consequence In 1814 Norway was taken by the allies from Denmark and given to Sweden The state became bankrupt, and many years passed before order could be restored to the finances Notwithstanding his autocratic tendencies, Frederick so far yielded to the movements of the times as to establish representative provincial councils in 1831-34 In the last two years of his reign the demand for a constitutional government took root and rapidly extended over the whole country Consult Giesing, *Zur Regierungsgeschichte Friedrichs VI* (Kiel, 1851-52), and Thorsoe, *Fra Frederik VI's Hofkredse* (Copenhagen, 1898)

FREDERICK VII (1808-63) King of Denmark from 1848 to 1863 He succeeded his father, Christian VIII, who died Jan. 20, 1848. Frederick promulgated the Unionist constitution devised by his father The principal events of his reign were the wars and diplomatic negotiations arising out of the revolt of the duchies of Schleswig and Holstein, and the dispute over the succession to Denmark proper and the duchies, on the death of the King and of his uncle, the heir presumptive, both of whom were childless. See SCHLESWIG-HOLSTEIN.

FREDERICK VIII (1843-1912) King of Denmark. He was the eldest son of Christian IX and of Louise of Hesse-Cassel. He was educated in a grammar school and fought in the War of 1864. After studying for some time at Oxford and traveling abroad, he married, in 1869, Princess Luise of Sweden, a niece of Oscar II. He succeeded to the throne on the death of his father, Jan 29, 1906. King Frederick died suddenly in Hamburg (May 14, 1912), and for several hours his body was not identified. He was succeeded by his eldest son, Prince Christian (See CHRISTIAN X). The King's second son, Charles, became, in 1905, King of Norway under the title Haakon VII (qv). Frederick was a brother of Queen Alexandra of England and of King George I of Greece.

FREDERICK III, called THE FAIR (c 1286-1330). German King and Duke of Austria. He failed to gain the throne after the death of his father, Albert I, and he quarreled with his cousin Louis IV, Duke of Upper Bavaria, who defeated him at the battle of Gammelsdorf in 1313. After the death of Henry VII, who had succeeded Albert I, a minority of the electors chose Frederick as German King (1314), and he was crowned by the Archbishop of Cologne, his cousin Louis was the choice of the majority of the electors. War was continued between the two rivals until Frederick was defeated and captured at Muhlendorf in 1322. He was released from captivity in 1325, but shortly afterward returned to the custody of Louis according to a previous agreement between the two. His return to captivity is referred to by Schiller in the poem *Deutsche Treue*.

FREDERICK II (1720-85). Landgrave of Hesse-Cassel. He was educated at Geneva, fought in the War of the Austrian Succession and (in 1745) against the Stuart pretender in Scotland, and succeeded his father, William VIII, in 1760. He contributed greatly to the improvement of Cassel, particularly its Museum, its Academy of Fine Arts, and a number of the fine buildings. To provide for his lavish expenditures, he sold a corps of 12,000 soldiers to England during the war of that country with the American Colonies.

FREDERICK II, called PRINCE OF HOMBURG (1633-1708). A German general, Landgrave of Hesse-Homburg. He entered the Swedish service in 1654, and at the siege of Copenhagen in 1659 lost his left leg. The artificial leg with silver trimmings which he wore gave him the nickname "mit dem silbernen Beine". He was made general of cavalry by the Great Elector of Brandenburg, Frederick William, and had a great share in the victory over the Swedes at Fehrbellin in 1675. In 1681 he succeeded his brother, George Christian, in Hesse-Homburg. He restored and improved Homburg, now one of the most beautiful spas of Germany. He married three times the widow of Oxenstierna (1661), Louise of Courland (1670), and Sophie Sibylle von Lemning (1691). Seven of his 15 children survived him. Von Kleist's play *Prinz Friedrich von Homburg* gives an entirely incorrect idea of his character. Consult the biographies by Hamel (Berlin, 1861) and Jungfer (ib, 1890).

FREDERICK I (1425-76). Elector Palatine, called the Victorious. At the death of his father, in 1439, a portion of the Palatinate devolved upon him, which he later ceded to his brother, Louis IV. In 1449, upon the death of Louis, he assumed the guardianship of his infant

nephew Philip and administered the government. In 1451, the country being troubled by warlike neighbors, Frederick persuaded the estates to invest him with the dignity of Elector for life, with the understanding that his children should not rank as princes, and that the succession should devolve upon his nephew. He was one of the opponents of the Emperor Frederick III and tried to dethrone him. His allies turned against him, but he defended himself ably and in 1462 won a great victory over his enemies at Seckenheim. His success secured him undisturbed possession of his principality until his death. The territory of the Palatinate was greatly increased during his reign. Consult Menzel, *Kurfurst Friedrich der Siegreiche von der Pfalz* (Munich, 1861), and Feeser, *Friedrich der Siegreiche* (Neuburg, 1880).

FREDERICK II (1482-1556). Elector Palatine, surnamed the Wise. He was the fourth son of Philip the Magnanimous and assumed the electoral crown in 1544, succeeding his brother Louis. When, in 1529, the Sultan Solymán besieged Vienna, Frederick assumed command of the Imperial army. In 1535 he married Dorothea, daughter of Christian II, ex-King of Denmark. Through the teaching of Melancthon he became familiar with the principles of the Reformation and joined the Schmalkald League. In later life he signed the Augsburg Interim. Consult Rott, *Friedrich II von der Pfalz und die Reformation* (Heidelberg, 1904).

FREDERICK III (1515-76). Elector Palatine, surnamed the Pious. He succeeded his father, John II, in the ducal possessions of the Simmern Palatinate in 1557 and upon the extinction of the elder Palatine line became Elector Palatine in 1559. From Lutheranism, which he embraced in 1546, he passed over in 1561 to Calvinism and aroused the hatred of the Lutheran princes. He lent aid to the adherents of the reformed religion in France and in the Netherlands. He laid the foundation of systematic Calvinism by causing the Heidelberg Catechism to be drawn up in 1563, devoting his personal attention to the work. Consult A. Kluckhohn, *Friedrich der Fromme* (Nordlingen, 1877-79) and *Briefe Friedrichs des Frommen*, ed by Kluckhohn (Brunswick, 1868-72).

FREDERICK IV (1574-1610). Elector Palatine, surnamed the Upright. He was the son of the Elector Louis VI and Elizabeth of Hesse. His father died during his infancy, and Frederick succeeded to the throne in 1583, under the guardianship of his uncle, John Casimir, assuming the reins of government in 1592, upon his uncle's death. Through his influence the Protestant Union was formed in 1608. He raised Mannheim, where many Protestants had taken refuge, to the dignity of a town, and his reign is characterized by firm devotion to the Protestant cause. Consult L. Hausser, *Geschichte der rheinischen Pfalz* (Heidelberg, 1856), and M. Ritter, *Geschichte der deutschen Union* (Schaffhausen, 1867-73).

FREDERICK V (1596-1632). Elector Palatine and King of Bohemia. He was the third son of the Elector Frederick IV, whom he succeeded in the Palatinate in 1610. He married, in 1613, Elizabeth, the daughter of James I of England, through whose ambitious counsels he was induced to take a prominent part in the proceedings of the union of the Protestant princes of Germany, and finally, although against his own inclinations, to accept the dignity of

King of Bohemia in 1619 His complete defeat at the battle of the White Hill, November, 1620 (see THIRTY YEARS' WAR), terminated his short-lived enjoyment of the regal crown, of which he retained no other memorial than the mocking title of "the Winter King" The rest of his life was spent in exile, under the ban of the Empire, and with resources obtained from the generosity of his friends In 1623 he was declared to have forfeited his electoral title and his dominions in the Palatinate The electoral dignity and the Upper Palatinate were conferred upon his cousin, Maximilian of Bavaria, the head of the Catholic League Frederick's daughter Sophia became the wife of the first Elector of Hanover and the mother of George I of England Her daughter married Frederick I of Prussia and was the grandmother of Frederick the Great He died at Mainz, Nov 20, 1632 Consult Gindely, *Geschichte des dreissigjährigen Krieges* (Prague, 1869-80), M Ritter, "Friedrich V," in the *Allgemeine deutsche Biographie*, vol vii (Leipzig, 1878), J. Krebs, *Die Politik des evangelischen Union in Jahre 1618* (Breslau, 1890-1901), *Deutsche Lieder auf den Winterkönig*, ed by R. Wolkan (Prague, 1899).

FREDERICK I (1657-1713). The first King of Prussia, from 1701 to 1713, previous to his assumption of the royal title, Elector of Brandenburg (1688-1701), as Frederick III He succeeded his father, Frederick William, the Great Elector of Brandenburg, in 1688 His name is a synonym for vanity and extravagance, but his subjects, nevertheless, loved him He modeled his life and his court after Louis XIV of France. In the first half of his reign his main concern was the acquisition of the royal title, in which endeavor he was assisted by the difficult position of the Emperor Leopold I, who pledged his consent, after a year of negotiation, on the eve of the outbreak of the War of the Spanish Succession In return for the Imperial permission Frederick was to furnish a considerable body of troops His troops helped to win the day for the allies on more than one occasion, yet at the Peace of Utrecht his only reward was a small district in Gelderland In this treaty Prussia was, however, recognized in the possession of Neuchâtel, which had fallen to her by inheritance Frederick I is remembered to-day as the patron of learned and liberal-minded men—of Spener, Francke, and Thomasius, and, above all, of Leibnitz He is also known as the founder of the Order of the Black Eagle, which is still considered the greatest mark of distinction that a king of Prussia can bestow He also founded the University of Halle Frederick died Feb 25, 1713, after having drained Prussia of all her financial resources Consult Henderson, *Short History of Germany* (New York, 1902), Pierson, *Preussische Geschichte* (Berlin, 1898), Friedensburg, *Historische Zeitschrift*, vol li, pp 407-432 (Munich, 1901)

FREDERICK II (1712-86). King of Prussia from 1740 to 1786, known as THE GREAT He was born Jan 24, 1712, and was the son of Frederick William I (qv) of Prussia and of Sophia Dorothea, daughter of George I of England The plan of education pursued by his father soon tended to render their relations unbearable Frederick William insisted on instilling into his son his own practical instincts and stifled the literary and artistic impulses which Frederick manifested at an early age At last Frederick determined to escape the pa-

rental tyranny by flight to England The plan was discovered, and the most severe punishment followed Frederick's aide and abettor, Lieutenant Katte, was beheaded before his eyes, and the Prince himself was led to expect a similar fate The father, however, relented, and Frederick was placed, instead, in the War and Domain Bureau at Custrin and made to work as an assistant clerk Here he learned most valuable lessons with regard to the task of administering a great kingdom A reconciliation finally took place between father and son The only act which Frederick never forgave his father was his forced marriage, for reasons of state policy, with Elizabeth of Brunswick-Bevern, whom he respected but never loved

Frederick's great wars fall in the first half of his reign Almost immediately after his accession, on the news of the death of the Emperor Charles VI and the accession of his daughter, Maria Theresa, in the Hapsburg dominions, he invaded Silesia, basing his claim to a large part of the country on an old transaction in which Austria had played a grasping and dishonest part (See SUCCESSION WARS) In the first battle of the Silesian campaign—that of Mollwitz, April, 1741—Frederick's general (Schwerin) found the situation so critical that he urged the King to fly for his life, and Frederick did not know until the next day that he had won the victory Mollwitz gained for Frederick the French alliance which practically decided the campaign After the victory of Frederick at Chotusitz, Maria Theresa agreed to the Peace of Breslau (1742), in which France, however, was not included In this treaty Austria ceded most of Silesia to Prussia Two years later Frederick reentered the struggle, ostensibly as the champion of the Emperor, the Bavarian Charles VII France was still his ally, while Maria Theresa could count on England, Saxony, and Holland Frederick took Prague, but was forced to abandon the city and make a disastrous retreat He soon retrieved his fortunes, however, at Hohenfriedberg (June, 1745), and his victory over the Saxons at Kesseldorf (December, 1745) was followed by the Treaty of Dresden, which was a repetition of the Peace of Breslau In 1756 Maria Theresa, inconsolable for the loss of Silesia, formed an alliance against Prussia with France (the old enemy of the Hapsburgs), Russia, Saxony, and Sweden England, as the enemy of France, now sided with Frederick The King of Prussia at once descended upon Saxony, thus opening the great struggle which involved all the European powers and their colonies (See SEVEN YEARS' WAR) The outcome of this gigantic conflict, which was the culmination of Frederick's military career, but which taxed the resources of his little kingdom to their utmost, left Prussia in 1763 territorially unchanged and in the enjoyment of great military prestige

Frederick had come through the war without incurring a national debt or increasing the direct taxes, on the other hand, he had inflated the currency, but by wise measures he soon put the finances of Prussia on a sound basis He practiced the most rigid economy in the royal household and was enabled to spend large sums in agricultural and industrial improvements He reclaimed thousands of acres of waste land by a system of canals and drainage, peopled them with colonists, and set on foot a large

FREDERICK THE GREAT
FROM A PAINTING BY GEORGE MEYN

number of industries, visiting at intervals every part of his dominions. He began a codification of the law, abolished serfdom within the royal domains, insisted on the impartial administration of justice, granted freedom of speech, and, at least in literary and scientific matters, liberty of the press. Tolerant towards every form of religious belief, he was one of the most intolerant of autocrats towards his ministers. To his enlightened despotism were due the regulation of customs and the equalization of taxation. He grimly put a tax on the hired Hessians that passed through his dominions, as "on cattle bought and sold." Frederick took a great interest in the American Revolution and admired and appreciated the greatness of Washington, and was one of the first sovereigns to conclude a commercial treaty with the United States. The desertion of Prussia by England at the critical period in the Seven Years' War had inspired in Frederick a bitterness towards the latter country which permanently influenced his foreign policy. On the other hand, he had drawn closer to Russia after the death of his uncompromising enemy, the Empress Elizabeth, and he and Catharine II were able to see their value as allies to each other, hence the partition of Poland.

Frederick's relation to the intellectual development of Germany was peculiar. Although Prussia had become through him one of the great continental powers, he had no sympathy whatever with German national aspirations. While he foresaw the future literary greatness of Germany, he ignored the eminent writers who were appearing upon the scene and despised the German language, which he never wrote with ease. French he spoke and wrote fluently, though he did not spell it correctly. He cultivated the society of French writers and scholars, among them Voltaire and Maupertuis, whom he invited to Sans-souci. He was consistent in his admiration of Voltaire, though not blind to his personal weaknesses. Conversation with his literary friends, and playing on the flute, on which he was a really skillful performer, were Frederick's only relaxation from incessant work. He was a voluminous writer. Of his numerous works, the most important are *Mémoires pour servir à l'histoire de Brandebourg*, *Histoire de la guerre de Sept Ans*, and the *Anti-Machiavel*, written before he became King, in which he laid down his views on government. The Berlin Academy published an edition of his collected works (30 vols., ed by Preuss, 1846-57).

Throughout his reign Frederick took the greatest interest in the improvement of the Prussian army. He wrote for the guidance of his generals a number of works covering the whole science of war. The army, which numbered 80,000 men when he ascended the throne, was increased to nearly 200,000 in his lifetime. Frederick died, Aug 17, 1786, at Sans-souci.

Consult Tuttle, *History of Prussia under Frederick the Great* (3 vols., Boston, 1888), the best work in English, unfortunately cut short at 1757 by the death of the scholarly author; Longman, *Frederick the Great and the Seven Years' War* (New York, 1881), a useful little compendium; Carlyle, *History of Frederick II* (London, 1888), is, on the whole, inadequate as history. These are the principal useful works in English. The greatest living authority is Koser, whose *Friedrich der Grosse als Kron-*

prinz (Stuttgart, 1903) is a small classic. He has also written a larger history, *Geschichte Friedrichs des Grossen* (4 vols., 1b, 1912-14). Consult also Lavissee, *La jeunesse du grand Frédéric* (Paris, 1891; 3d ed, 1899) and *Le grand Frédéric avant l'avènement* (1b, 1893), Preuss, *Friedrichs des Grossen Lebensgeschichte* (Berlin, 1832-34), Kugler, *Geschichte Friedrichs des Grossen* (12th ed, Leipzig, 1887), and numerous other general and special studies, a bibliography of which may be found in Lavissee and Rambaud, *Histoire générale*, vol vii (Paris 1893-1900), Bordeaux, *Le grand Frédéric* (2 vols., 1b, 1900-02), J. W. Whittall, *Frederick the Great on Kingscraft* (New York and London, 1901), L. Paul-Dubois, *Frédéric le grand, d'après sa correspondance politique* (Paris, 1903), F. T. Kugler, *Life of Frederick the Great* (London, 1903), W. F. Reddanay, *Frederick the Great and the Rise of Prussia* (1b, 1904), G. Winter, *Friedrich der Grosse* (Berlin, 1907), G. L. Mamlock, *Friedrichs des Grossen Korrespondenz mit Aertzen* (Stuttgart, 1907), G. B. Volz, *Aus der Zeit Friedrich der Grosse* (Gotha, 1908), A. Kohut, *Friedrich der Grosse als Humorist* (Leipzig, 1908), E. Daniels, *Frederick the Great and his Successor*, in "Cambridge Modern History" (London, 1909).

FREDERICK III (1831-88). German Emperor and King of Prussia from March 9 to June 15, 1888. Before his accession to the throne he was known as Frederick William. He was the only son of William I, King of Prussia and first Emperor of united Germany, and was born Oct 18, 1831. His earnest character and decided talents were developed under the care of excellent masters, among others Ernst Curtius (qv), who accompanied him to the University of Bonn, where the Prince was matriculated in the law faculty. After the completion of his education the Prince visited several foreign countries. In England he became attached to the Princess Royal, Victoria, to whom he was married, Jan 25, 1858. The marriage was highly approved by both nations, and the life of the royal couple was an exceedingly happy one. After his father's accession to the throne the Crown Prince took part in the more important affairs of the state. During the war with Denmark in 1864 he was sent to the scene of operations in order to exert his personal influence towards removing the friction among those in charge of affairs. In the war with Austria in 1866 he commanded the Second Prussian Army, and by a forced march arrived on the scene of the battle of Sadowa in time to decide the issue. In the Franco-German War he commanded the Third Army, consisting of the South German forces. He won the first victory of the war, that of Weissenburg (August 4), and inflicted a decisive defeat on the army of MacMahon at Worth (August 6). Seconded by the Crown Prince of Saxony, he vanquished MacMahon at Sedan and compelled him to surrender with his whole army (September 2). Two weeks later he began the investment of Paris and had the principal share in its reduction. He played a considerable part in the founding of the new German Empire, although his plans differed in some essential respects from those advocated by Bismarck. During the Emperor's illness in 1878, his public functions were discharged by the Crown Prince, who showed great ability in the performance of his duties. In January, 1887, he was attacked by a

cancerous throat trouble, necessitating several surgical operations, which were heroically borne. On the death of his father, March 9, 1888, he ascended the throne as Frederick III. He died June 15 of the same year. Liberal, cultivated, and a friend of parliamentary government, he was greatly beloved by all, especially by the army, and bore the popular appellation of "Unser Fritz." He wrote diaries of his travels in the East and of his part in the wars of 1866 and 1870-71. He had eight children, the eldest of whom is the reigning Emperor, William II (qv). Consult Gustav Freytag, *Der Kronprinz und die deutsche Kaiserkrone* (Leipzig, 1889); M. von Poschinger, *Kaiser Friedrich* (3 vols, Berlin, 1898-1900), adapted into English by Sidney Whitman, *Life of Emperor Frederick* (New York, 1901), Schuster, *Briefe des Kaisers und Königs Friedrich III* (Berlin, 1907).

FREDERICK I (1369-1428) Elector and Duke of Saxony, called the Warlike. He was the son of Frederick the Stern, of Meissen. With his two brothers he succeeded, on the death of the father, in 1381, to the inheritance, but they were compelled to divide with their two uncles. Frederick distinguished himself as a soldier, and in 1423, in recognition of his successes against the Hussites, Emperor Sigismund made him Elector and Duke of Saxe-Wittenberg. He was defeated by the Hussites at Aussig in 1426. He and his brother founded the University of Leipzig in 1409. Among his direct descendants is the Guelph dynasty of England. Consult Bottiger and Flatte, *Geschichte des Kurstaates und Königreichs Sachsen* (3 vols, Hamburg, 1830-73).

FREDERICK II, called the Mild (1411-64) Elector and Duke of Saxony, son of Elector Frederick I. He was joint heir of the family lands with his three brothers, defended Saxony against the Hussites, increased his possessions by obtaining a part of Lower Lusatia and the Burgraviate of Meissen, and succeeded in establishing his right to the Electorate of Saxony over Bernard IV, Duke of Saxe-Lauenburg. From 1446 to 1451 he was engaged in a fierce struggle with his brother William over the partition of the lands of their deceased cousin, Frederick the Peaceful. In 1455 an attempt was made to abduct Frederick's two sons, an event referred to in German history as the "Prinzenraub."

FREDERICK III (1463-1525) Elector and Duke of Saxony, called the Wise. He was a grandson of Frederick II and succeeded his father, Duke Ernest, in the government. He founded the University of Wittenberg in 1502 and called Luther and Melancthon to chairs in the faculty. He never adopted the creed of the Reformers, but he accorded them toleration, protected Luther at the Diet of Worms and sheltered him in the castle of Wartburg. In 1493 he visited the Holy Land and in Jerusalem was made a Knight of the Sepulchre. He brought about many reforms in the constitution of the Empire, and on the death of Maximilian I, in 1519, he was offered the Imperial throne, but declined it, and recommended Charles I of Spain, who became Emperor as Charles V. Consult Kolde, *Friedrich der Weise und die Anfänge der Reformation* (Erlangen, 1881).

FREDERICK III (1272-1337) King of Sicily, son of King Peter of Sicily and Aragon. Upon the accession of his elder brother James to the throne of Aragon, Frederick was made

Regent of Sicily, but when James surrendered the island to be held by the Church for Charles II of Anjou the Sicilians revolted and chose Frederick as their King, at Palermo, in 1296. In the war that followed Frederick met with varying success until 1302, when he concluded a favorable treaty with Charles II. In 1313 he entered into an alliance with Emperor Henry VII and again made war on the Angevins, with whom he fought intermittently until the end of his reign. From 1321 to 1335 he was excommunicated by the Pope. Frederick's rule served to weld the Sicilians into a united nation.

FREDERICK I, WILLIAM CHARLES (1754-1816) Duke, and subsequently first King, of Württemberg. He was born at Treptow, Pomerania, and was a son of Duke Frederick Eugene and Sophia Dorothea, niece of Frederick the Great. After serving in the Prussian and Russian armies, in 1797 he succeeded his father as Duke and in 1803 was invested with the electoral dignity. At the close of 1805 Napoleon, in reward for his aid against Austria, erected his state into a kingdom, and on Jan. 1, 1806, Frederick assumed the royal title. He soon afterward joined the Confederation of the Rhine. The territory over which he ruled was greatly enlarged during his reign. In 1802, when he ceded territory on the left bank of the Rhine to France, he received nine Imperial towns in return, in 1805 he got some Austrian territory, and in 1809 his kingdom was further enlarged. Especially after 1801, his autocratic government and subserviency to Napoleon I and the oppressive conditions of enforced conscription and excessive taxation made him an unpopular ruler. Frederick joined the league against France after the battle of Leipzig and thus preserved the kingdom he had gained through aiding Napoleon. Consult Pfister, *König Friedrich von Württemberg und seine Zeit* (Stuttgart, 1888), and Schlossberger's edition (ib. 1886-89) of the King's correspondence with Napoleon and with his daughter, who married Jerome of Westphalia.

FREDERICK I, WILLIAM LOUIS (1826-1907) Grand Duke of Baden. He was born at Karlsruhe, son of the Grand Duke Leopold and of Princess Sophia of Sweden. He was educated at Heidelberg and Bonn and, after acting as Prince Regent for four years, succeeded to the government in 1856. Immediately upon his accession to the throne he restored the constitution of the grand duchy and during a rule lasting more than 50 years he zealously promoted economic and educational progress. He sided with Austria in the War of 1866, but afterwards entered into close relations with Prussia and the North German Confederation. In 1856 he married Louise, daughter of William of Prussia (afterward German Emperor). Consult the sketches by Dove (Heidelberg, 1902) and Lorenz (Berlin, 1902).

FREDERICK AUGUSTUS I (1750-1827) Elector (as such Frederick Augustus III) and from 1806 first King of Saxony. He was the son of the Elector Frederick Christian and succeeded his father under the guardianship of his uncle, Prince Xavier, in 1763. In 1768 he was declared of age. In 1769 he married Princess Maria Amelia of Zweibrücken. He sided with Frederick the Great against Austria in the War of the Bavarian Succession (1778-79) and afterward joined the League of German Princes. In 1791 he was offered the crown of Poland, but

declined it. In 1792 he reluctantly took up arms against France. During the war between France and Austria, in 1805, he maintained a strict neutrality, but in the following year he joined Prussia against France. The disastrous battle of Jena forced him to conclude a treaty of alliance with Napoleon, December, 1806. He was allowed to assume the royal title and joined the Rhenish Confederation. In 1807 he was invested with the newly created Duchy of Warsaw, but was ruler of it only in name, the control being exercised by Napoleon himself. During the subsequent wars of Napoleon he was a faithful ally of the Emperor. He was taken prisoner by the allies after the entry into Leipzig, Oct. 19, 1813, and by the decrees of the Congress of Vienna he was compelled to cede more than half of his kingdom to Prussia. He devoted the remainder of his life to the development of the agricultural and commercial resources of his kingdom, and directed his attention especially to the administration of justice. Consult A. Bonnetons, *Un Alhé de Napoléon, Frédéric Auguste premier roi de Saxe* (Paris, 1902).

FREDERICK AUGUSTUS II (1797-1854). King of Saxony from 1836 to 1854. He was the eldest son of Prince Maximilian of Saxony and brother of Frederick Augustus I. In 1830, on the outbreak of political disturbances in Dresden, he was named joint Regent of the kingdom with King Anthony. In 1836 he succeeded Anthony on the throne. An insurrection in Dresden in May, 1849, obliged him to avail himself of the help of Prussian troops. But, the rising once quelled, his reign continued tranquil and prosperous. He died as the result of a fall from his carriage while traveling in Tirol, Aug. 9, 1854. Consult F. F. von Beust, *Aus drei-viertel Jahrhunderten* (2 vols. Stuttgart, 1887), and F. Foerster, *Friedrich August II "der Starke," Kurfürst von Sachsen* (Leipzig, 1910).

FREDERICK AUGUSTUS III (1865-) King of Saxony. He studied at Strassburg and Leipzig, entered the army in 1883, and in 1902 attained the rank of general of infantry in the Prussian service. He succeeded his father George on the throne Oct. 15, 1904. In 1891 he married Princess Louise of Tuscany, by whom he had five children. In 1902 she eloped with André Giron, a tutor in the Prince's household, and in 1903 was divorced by her husband. She received the title of Countess of Montignoso. Consult the sketch by Von Metzsch (Berlin, 1906).

FREDERICK CHARLES (1828-85). Prince of Prussia. He was the only son of Prince Charles, brother of Emperor William I, and was educated at Bonn. His early military training he got from the great Von Roon. He served with distinction in the early stage of the first Schleswig-Holstein War in 1848 and was wounded at Weisenthal in Baden (1849). He devoted himself assiduously to the study of military science and in 1858 traveled in France and studied the French army. In 1860 he became commander of the Third Army Corps. During the Danish War of 1864 he stormed the fortifications at Düppel (April 18, 1864) and in the following month was intrusted with the chief command of the allied forces. He was commander of the First Division of the army during the conflict with Austria (1866) and, after winning the skirmishes of Podol, Munchengratz, and Gitschin in rapid succession, obstinately de-

fended the Prussian centre at the battle of Sadowa until the arrival of the army of the Crown Prince. Still more conspicuous was his leadership during the Franco-German War of 1870-71, when he commanded the Second Army, consisting of six army corps, 500 guns, and 260,000 men. He defeated Bazaine at Vionville (Mars-la-Tour) on Aug. 16, 1870, and two days later, seconded by General Steinmetz, at Gravelotte, ultimately compelling Bazaine to capitulate with his army of about 180,000 men and to surrender the fortress of Metz. He subsequently defeated the Army of the Loire, under General Aurelle de Paladines, after a campaign of six weeks. After the war he became inspector of Prussian cavalry. In 1837 he married Maria Anna of Anhalt. His son Frederick Leopold (1863-) married a younger sister of the German Empress, and one of his daughters, Louisa Margaret (1860-), married Arthur, Duke of Connaught. Consult the biographies by Homig (Berlin, 1885) and Müller-Bohn (Potsdam, 1902).

FREDERICK FRANCIS II (1823-83). Grand Duke of Mecklenburg-Schwerin. He was a son of Grand Duke Paul Frederick and of the Princess Alexandrine of Prussia and was educated at Bonn. In 1842 he succeeded his father and was appointed general in the Prussian army, in which capacity he fought with distinction in the War of 1866. In the war with France, as commander of the Thirteenth Army Corps, he invested the fortress of Toul, which surrendered on Sept. 23, 1870, and in December distinguished himself in the operations on the Loire. During the siege of Paris he commanded the divisions guarding the approaches to the besieging army. A magnificent monument was erected to his memory at Schwerin in 1893. Consult the biography by Von Hirschfeld (Leipzig, 1891).

FREDERICK HENRY (1584-1647). Prince of Orange, son of William the Silent, born at Delft. He was trained to arms by his elder brother, Maurice of Nassau, whom he succeeded to the paternal honors and estates in 1625. He demonstrated his generalship by capturing Hertogenbosch (1629), Maastricht (1632), Breda (1637), Sas van Ghent (1644), and Hulst (1645), and his statesmanship by concluding a treaty with Spain in which the Dutch gained every point for which they had fought so long. Under his stadtholderate the Dutch Republic is considered to have reached its greatest power and influence. Consult *Mémoires de Frédéric Henri* (Amsterdam, 1743).

FREDÉRIC-LEMAÎTRE, ANTOINE LOUIS PROSPER. See LEMAÎTRE.

FREDERICK LOUIS (1707-51). Prince of Wales. He was born at Hanover, Germany, the eldest son of George II and Queen Caroline. He came to England at the age of 17, was made Prince of Wales in 1729, and married the Princess Augusta of Saxe-Gotha in 1736. The bitterness between him and his father and mother went to great lengths. It was due in the first place to the veto on his marriage to Wilhelmina of Prussia and was aggravated by his father's stinginess towards him. An attempted reconciliation in 1742 was unsuccessful. The Prince was a gambler and a loose liver. His son afterward came to the throne as George III and his youngest daughter married Christian VII of Denmark.

FREDERICKSBURG. A town and the

county seat of Gillespie Co, Tex, 80 miles west of Austin and 25 miles north of Comfort, the shipping point on the San Antonio and Aransas Pass Railroad (Map Texas, C 4) Stock raising and farming are the leading industries, and there are roller mills and a tombstone factory A German colony founded Fredericksburg in 1846 The town owns its electric-light plant Pop, 1914 (local est), 3000.

FREDERICKSBURG An independent city of Virginia, 60 miles by rail north of Richmond, on the Rappahannock River at the head of tidewater, on the Potomac, Fredericksburg, and Piedmont, and the Richmond, Fredericksburg, and Potomac railroads, and on the Maryland, Delaware, and Virginia boat line (Map Virginia, G 3) The city lies in a valley inclosed by high hills and has two public libraries, several bridges across the river, a beautiful park, and the famous Stonewall (Confederate) and National cemeteries, the latter having 15,300 graves It is the seat of Fredericksburg College (Presbyterian), opened in 1893, and of a State normal school It contains also the Washington and Paul Jones homes A dam above the city, 900 feet long and 18 feet high, affords valuable water power, and there are manufactures of flour, silk, and woolen goods, iron, shoes, shirts, pickles, cigars, sumac, carriages, wheels, hubs, spokes, tanned leather, and excelsior Fredericksburg has adopted the commission form of government The city owns and operates its water works and gas and electric-light plants Pop, 1900, 5068, 1910, 5874 On the site of Fredericksburg, Capt. John Smith fought a skirmish with the Rappahannock Indians in 1608 The town was named in 1727 in honor of the Prince of Wales and incorporated in 1782 It was the home of Gen. Hugh Mercer, killed in the battle of Princeton, and of the Revolutionary officers George Weedon, William Woodford, Thomas Posey, and Gustavus B Wallace A monument has been erected in honor of Washington's mother, who died here in 1789, and a statue to General Mercer During the Civil War, Fredericksburg changed hands several times and was the scene of several battles See **FREDERICKSBURG, BATTLE OF**, **CHANCELLORSVILLE, BATTLE OF**

FREDERICKSBURG, BATTLE OF. An important battle of the Civil War in America, fought on Dec 13, 1862, at Fredericksburg, Va, between the Federal Army of the Potomac, numbering about 116,000, under General Burnside, and the Confederate Army of Northern Virginia, numbering about 78,000, under General Lee On November 15 Burnside, who on November 7, seven weeks after the battle of Antietam, had superseded McClellan as commander of the Army of the Potomac, then stationed near Warrenton, Va, started down the left bank of the Rappahannock with the intention of crossing at Fredericksburg, where he expected General Halleck to have pontoon bridges in readiness, and of marching thence on Richmond The Right Grand Division under Sumner arrived at Falmouth, near Fredericksburg, on the 17th, but could not effect a crossing, owing to the absence of bridges, and was accordingly stationed on Stafford Heights, opposite Fredericksburg Hooker and Franklin, commanding the Centre and Left Grand Division, arrived soon afterward Meanwhile Longstreet, acting under orders from Lee, hastened to Fredericksburg by forced marches, reached there on the 21st, and

immediately took up a position on the hills back of the town, which he proceeded with great energy to fortify Jackson's corps arrived from the Shenandoah valley about November 30, and Jackson assumed command of the right of the Confederate army, the whole Confederate line ultimately extending for more than six miles, though it was broken in several places by streams and ravines Burnside was not ready to cross the Rappahannock until December 11, and on that day and on the 12th the Right and Left Grand Divisions succeeded in passing to the other side, though the former, which crossed directly in front of Fredericksburg, met with considerable opposition from Confederate sharpshooters concealed in a cluster of brick and stone houses on the opposite bank Hooker's Centre Grand Division crossed on the morning of the 13th and was broken up to assist the Right and Left After much hesitation and vacillation Burnside, bewildered and confused by a task far transcending his ability, finally decided upon a plan of battle, in accordance with which, about noon on the 13th, Franklin, facing Jackson at the weakest point of the Confederate line—their extreme right—ordered Meade forward, with a single division, supported by two other divisions under Gibbon and Doubleday, to seize one of the opposing heights Meade succeeded in penetrating the Confederate line, but along with Gibbon was soon forced back, so that this movement, which was the only one made by the Federal left, resulted in nothing but loss Meanwhile, on the Federal right, Sumner six times attacked the almost impregnable Confederate works on Marye's Hill, but was each time driven back with terrific loss, the Federal troops, however, displaying in each attack wonderful steadiness and gallantry The hill itself was heavily fortified At its base, and parallel to the line of battle, ran a sunken road protected by a stone wall, behind which a large force of Confederates was stationed, and the approach was such as to expose an attacking force to an irresistible rain of shot and shell At the end of the day's fighting the Federals had lost in killed, wounded, and missing 12,653, the Confederates, 5377 Burnside contemplated repeating his attack on the following day, but was dissuaded by his officers and withdrew unmolested to the left bank of the river on the night of the 15th Consult *Official Records*, vol xxi, Johnson and Buel, *The Battles and Leaders of the Civil War*, vol iii (New York, 1887), Ropes, *The Story of the Civil War*, vol ii (ib, 1898), Palfrey, *Antietam and Fredericksburg* (ib, 1882), Nicolay and Hay, *Abraham Lincoln A History*, vol vi (ib, 1890), Allan, *The Army of Northern Virginia in 1862* (Boston, 1892), Henderson, *Campaign of Fredericksburg, November-December, 1862* (London, 1886), Alexander, *Military Memoirs of a Confederate* (New York, 1907), Steele, *American Campaigns* (Washington, 1909)

FREDERICKTOWN. A city and the county seat of Madison Co, Mo, 104 miles by rail south of St Louis, on the St Louis, Iron Mountain, and Southern Railroad (Map Missouri, F 4) It is the seat of Marvin College (Methodist Episcopal, South) In the vicinity is La Motte, a lead mine in continuous operation for more than 200 years The chief industries of the city are the mining of cobalt, lead, nickel, and copper, and the manufacture of railroad ties An electric-light and power plant is owned

and operated by the municipality Pop, 1900, 1877, 1910, 2632

FREDERICK WILLIAM (1620-88). Elector of Brandenburg from 1640 to 1688, commonly called the Great Elector. He was the son of the Elector George William, and was born Feb 16, 1620. On his accession he found an empty exchequer, the towns and cities depopulated, and the whole electorate devastated by the ravages of the Swedish and Imperialist armies during the Thirty Years' War, which was not yet concluded. A portion of his inheritance had even been seized by the Swedes. His first acts were to regulate the finances and to conclude a treaty of neutrality with Sweden, which left him at leisure to devote himself to the organization of his army and the repopling of the deserted towns and villages by means of immigration. By the Treaty of Westphalia in 1648, he secured Further Pomerania (east of the Oder) and received the bishoprics of Halberstadt, Minden, and Kammin as lay principalities, together with the reversion of the see of Magdeburg. In the course of ten years he had, by the help of his generals, Derfflinger, Schomberg, and Kannenberg, created an army of 25,000 men, organized on the Swedish model. In 1656 he entered into an alliance with Charles X of Sweden against Poland and cooperated with him in the taking of Warsaw. In the following year he forsook the Swedish alliance and placed himself on the side of Poland, which, in the Treaty of Wehlau, renounced its suzerainty over the Duchy of Prussia. The aggressions of Louis XIV, who sought to extend the French dominions to the Rhine and made an onslaught upon Holland, alarmed the Elector, who induced the Emperor Leopold I, the King of Denmark, and the Elector of Hesse-Cassel to enter into a league against France (1672). The result was unfavorable, and Frederick William was obliged to content himself with making highly disadvantageous terms in the following year. The war was soon renewed, and Brandenburg was again laid open to the incursions of the Swedes, who, at the instigation of Louis XIV, advanced upon Berlin, laying waste everything on their march. The Elector, who had taken up his winter quarters in Franconia, hurried across the Elbe at the head of his cavalry and signally defeated the Swedes at Fehrbellin (June 18, 1675), driving them from his dominions. Deserted, however, by the other German princes, and his dominions overrun by the troops of Louis, he was obliged to agree to the Treaty of Saint-Germain, by which he restored all his conquests to the Swedes, in return for the withdrawal of the French army and an indemnity of 300,000 crowns. After this Frederick William devoted himself to the task of furthering the prosperity of his dominions. By his reception of 20,000 French Protestants, after the revocation of the Edict of Nantes (qv), and the encouragement which he afforded to the immigration of Hollanders and other foreigners, he augmented the population of his states and introduced numerous industries among his subjects. It is difficult to estimate his services for they were so great as to deserve the eulogy given by Frederick the Great, "*Messieurs, celui-ci a fait de grandes choses*". He founded the University of Duisburg and the Royal Library at Berlin and reorganized the universities of Frankfurt on the Oder and Königsberg. He opened canals, established a system of posts,

and greatly enlarged and beautified Berlin. He left a well-filled exchequer and a highly organized army. Consult Tuttle, *History of Prussia, 1134-1740* (Boston, 1884), Hiltl, *Der grosse Kurfürst und seine Zeit* (Bielefeld, 1893), H. Landwehr, *Die Kirchenpolitik des grossen Kurfürsten* (Berlin, 1894), E. Heyck, *Der grosse Kurfürst* (ib, 1897-1903), Philippson, *Der grosse Kurfürst* (ib, 1897-1902), Spahn, *Der grosse Kurfürst* (Mainz, 1902), A. Waddington, *Le Grand Electeur et Louis XIV* (Paris, 1905), A. W. Ward, *The Great Elector and the First Prussian King*, in "Cambridge Modern History" (London, 1908), F. Fehling, *Die europäische Politik des grossen Kurfürsten, 1607-1688* (Leipzig, 1910).

FREDERICK WILLIAM (1771-1815). Duke of Brunswick. He entered the Prussian service in 1788 and was actively engaged with the army during the war with France, which began in 1792, and after the battle of Auerstadt was taken prisoner at Lubeck (Nov 7, 1806). Frederick William joined Austria in the war against Napoleon in 1809. The defeat of the Austrians at Wagram left him isolated in central Germany, and he determined to make for the North Sea and England. With 1500 men he set out from Leipzig (July 20), passed through Brunswick, where he overthrew 4000 Westphalians under Reubel, crossed the Weser, reached Elsfleth, seized all the available shipping, and sailed for England (August 7). He entered the English service with his men and afterward took part in the War of the Peninsula, where he served with distinction till his return to his own dominions in 1813. His attempts to maintain an excessive army and to force reforms upon his people made him very unpopular. He joined the allied army with a force of 8000 men after the return of Napoleon from Elba, and fell while leading his men at Quatre-Bras, on June 16, 1815.

FREDERICK WILLIAM I (1802-75). Elector of Hesse. He was educated at Marburg and Leipzig and became Coregent in 1831 and Elector in 1847. He sided with Austria during the War of 1866, and his refusal to accede to the terms of Prussia led to the invasion of his territory. In consequence of his obstinate refusal to treat with the Prussian government he was arrested and conveyed to the fortress of Stettin, and his territories were annexed by Prussia. Hismorganatic wife, Gertrude Falkenstein (1806-82), whom he married in 1831, was the divorced wife of a Prussian lieutenant. Consult the biography by Grebe (Cassel, 1902).

FREDERICK WILLIAM I (1688-1740). King of Prussia from 1713 to 1740. He was the son of Frederick I and was born Aug 15, 1688. He was in almost every particular the opposite of his father—simple and almost penurious in his habits, attending to business, passionately fond of military exercises, averse to culture, fond of the low and illiterate, and carrying to the utmost his ideas of arbitrary power and the divine right of kings. From Charles XII of Sweden he wrested a great part of Hither Pomerania, including Stettin, playing a rôle which he himself confessed was not fit for an honest man. He died at Potsdam, May 31, 1740. As the founder of an administrative system, of which he himself worked out the minutest details, Frederick William stands prominent among the monarchs of his century. His

childish love for tall soldiers induced him to resort to the most flagrant outrages, both at home and abroad, for kidnaping tall men and forcing them into his service. The result of this system, which was greatly moderated towards the end of his reign, was that he left at his death a well-drilled army of 80,000 soldiers. What was of more consequence to his son and successor was that his exchequer contained 9,000,000 thalers, and that his kingdom had attained an area of more than 45,000 square miles and a population of upward of 2,200,000. Consult Tuttle, *History of Prussia, 1134-1740* (Boston, 1884), Forster, *Geschichte Friedrich Wilhelms I* (Potsdam, 1835), Carlyle, *History of Frederick II, called Frederick the Great* (London, 1858-65).

FREDERICK WILLIAM II (1744-97). King of Prussia from 1786 to 1797. He was the son of Prince Augustus William of Prussia, the brother of Frederick the Great, and was born Sept 25, 1744. During his reign Prussia declined, owing to his indolence and lack of political sagacity. He gave himself up to sensuality and to the mystic vagaries of the Rosicrucians. He contracted four marriages, besides making no secret of his relations with the Countess Lichtenau. His good nature led him to abrogate taxes which the country could hardly spare. A futile expedition into Holland, in support of the stadholders, cost him 6,000,000 thalers, and his efforts, in conjunction with Austria, to uphold royalty in France, resulted, after a war lasting from 1792 to 1795, in the cession to France, by the Treaty of Basel, of the Prussian territories west of the Rhine. Frederick William II shared in the second and third partitions of Poland (1793, 1795), by which Prussia received large accessions of territory. Consult Treitschke, *Deutsche Geschichte im XIXten Jahrhundert* (Leipzig, 1873-95), Paulig, *Friedrich Wilhelm II, sein Privatleben und seine Regierung* (Frankfort on the Oder, 1896), Stanhope, *A Mystic on the Prussian Throne* (London, 1912).

FREDERICK WILLIAM III (1770-1840). King of Prussia from 1797 to 1840. He was the son of Frederick William II and was born Aug 3, 1770, at Potsdam. On his accession in 1797 he dismissed the favorites of the preceding reign and entered upon a tour of inspection through the numerous provinces of his kingdom for the purpose of investigating their condition. But though Frederick William was well intentioned, he lacked the force of will to cope with the difficulties of his position. In the reconstitution of the German Empire after the Peace of Lunéville (1801), Prussia acquired the sees of Hildesheim, Paderborn, and Munster, as a compensation for her territories west of the Rhine wrested from her by France. The repeated and systematic insults of Napoleon, who despised Frederick William while he professed to treat him as a friend, roused the spirit of the nation, and the King saw himself obliged to agree to a convention with Russia, the real object of which was to drive Napoleon out of Germany. But when Napoleon marched against Austria in 1805, Frederick William remained inactive. After the battle of Austerlitz (December, 1805) he even entered into a convention with Napoleon, by which Prussia gave up Ansbach, Bayreuth, Cleves, and Neuchâtel, and received more than their equivalent in Hanover, wrested by Napoleon from the English dynasty

The affronts of Napoleon were redoubled after this fresh proof of Frederick William's indecision. The Prussian nation, headed by the Queen, the beautiful Louisa of Mecklenburg-Strelitz, now called loudly for war, and the King yielded. The Prussian army was annihilated in the battles of Jena and Auerstadt, fought on the same day (Oct 14, 1806), and the French overran the kingdom. The Russian armies advanced to the aid of Prussia. The indecisive battle between the allies and the French at Eylau (Feb 7, 8, 1807) was followed by the victory of Napoleon over the Russians at Friedland (June 14), which left Prussia at the mercy of the conqueror. In the Treaty of Tilsit, July 9, 1807, Prussia was almost dismembered, being forced to give up her possessions west of the Elbe and the Polish dominions acquired in 1793 and 1795. During the next few years Prussia remained almost effaced as a European power, and Napoleon seized every opportunity of humbling Frederick William. But during this period of humiliation the King and his people were quietly undertaking the task of regeneration. Frederick William's great Minister, Stein, emancipated the serfs and inaugurated local self-government in the towns. Scharnhorst and Gneisenau reorganized the army, training in secret three times as many men as were allowed by treaty with Napoleon. The disastrous termination of Napoleon's Russian campaign was the turning point in the fortunes of Prussia. At the beginning of 1813 the German people rose in arms against France, Frederick William entering into an alliance with Russia. Napoleon was victorious at Lutzen and Bautzen, May, 1813. Austria now took up arms against France, and the battle of Leipzig, October, 1813, achieved the liberation of Germany. Prussia joined in the invasion of France, and her armies entered Paris. The Congress of Vienna restored to Prussia a great part of her former possessions, and among her acquisitions were half of the Kingdom of Saxony and large territories in the Rhineland. The part played by Blücher at Waterloo determined Prussia's rank among the great military powers of Europe. The Prussian people, however, were doomed to disappointment in the erection of a new era of liberal government. In 1815 Frederick William joined Czar Alexander I and the Emperor Francis of Austria in the formation of the Holy Alliance, the chief object of which soon showed itself to be the maintenance of absolutism. The Prussian King played into the hands of Metternich, who directed the policy of the Holy Alliance. Frederick William III, however, did much for the material advancement of his realm. In his reign the Zollverein, or customs union, was established, which at the time of his death included the bulk of the German states, exclusive of Austria. He died June 7, 1840. Consult M W Duncker, *Aus der Zeit Friedrichs der Grossen und Friedrich Wilhelm III* (Leipzig, 1876), Treitschke, *Deutsche Geschichte im XIXten Jahrhundert* (ib, 1886-95), especially vol 1, Correspondence (*Briefwechsel*) of King Frederick William III and Queen Louise with Emperor Alexander I (ib, 1900), ed by P Baillen. See GERMANY; PRUSSIA, GNEISENAU, STEIN, SCHARNHORST.

FREDERICK WILLIAM IV (1795-1861). King of Prussia from 1840 to 1861. He was the son of Frederick William III and was born Oct 15, 1795. He received a careful education and was fond of the society of learned men,

such as Delbruck and Ancillon. He was a great lover of art and the study of antiquity. He ascended the throne June 7, 1840. He exhibited much of his father's vacillation and instability of purpose, and although he began his reign by granting minor reforms and promising radical changes of a liberal character, he always, on one plea or another, evaded the fulfillment of these pledges. He had high but vague ideas of "the Christian state" and showed through life a strong tendency to mystic pietism. He refused to allow a constitution to come between himself and God. Equally vague was his dream of a Germany united under a "college of kings" ruling by divine right. A step in the direction of popular government was taken in 1847 by the convocation of the so-called "United Diet," whose activity, however, was to be merely that of an advisory body. The February revolution in France in 1848 was followed by an outbreak in Prussia which shook the throne of the Hohenzollern to its foundations. On March 18 the people of Berlin rose in arms. To save his crown, the King yielded to the demand for constitutional reform, although the Prussian army remained true to him, he did not want to use it against "his Berliners." In May a national Constituent Assembly met, at the same time that the Frankfurt Parliament assembled to reorganize the political system of Germany. On Feb. 26, 1849, the new Prussian Chambers met, but the constitutional régime thus inaugurated was granted merely as the King's free gift, to be modified at his pleasure. On March 28, 1849, the Frankfurt Parliament offered the Imperial crown of Germany to Frederick William, but he declined it, as coming "from the gutter" (See GERMANY). In the meanwhile the King had been forced, in 1848, by the clamor of his subjects, to take up arms in support of the people of Schleswig-Holstein (qv) in their revolt against Denmark, but Prussia soon abandoned the cause of the duchies. After the complete cessation of the revolutionary movement in Germany the reactionary régime was in full sway. The "pietists" regained their former influence at court, and the freedom of the press and of religious and political opinion was strictly circumscribed. In 1857 Frederick William was seized with intermittent attacks of insanity, and in 1858 he resigned the management of public affairs to his brother and heir, Prince William, who acted as Regent of the kingdom till his accession, on the death of Frederick William, which occurred Jan. 2, 1861. Consult Biedermann, *Dreissig Jahre deutscher Geschichte* (Breslau, 1896), Meinecke, "Friedrich Wilhelm IV und Deutschland" (*Historische Zeitschrift*, vol. lxx, Munich, 1902), Ludwig, *Ueber Friedrich Wilhelm IV's Stellung zur preussischen Verfassungsfrage* (Breslau, 1907).

FREDERICQ, frâ'de-rék, PAUL (1850-). A Flemish historian, born at Ghent. He was educated at Liège and held successively the chairs of history at Arlon, Liège, and Ghent, where he became a prominent leader of the national movement for the extension of the Flemish language, customs, and laws. His numerous works, in Dutch, French, and Latin, distinguished by scholarly research and clearness of exposition, include *De Nederlanden onder Kenzer Karel V* (1885), *Geschiedenis der inquisitie in de Nederlanden* (1889-1902), *Onze historische volksliederen van voor de godsdienstige beroerten der 16e eeuw* (1894), *Corpus*

Documentorum Inquisitionis Hæreticæ Pravitatis Neerlandicæ (1889-1903).

FREDERICTON. A city and port of entry, the capital of York County and of New Brunswick, Canada, on the St. John River, 67 miles north-northwest of St. John, and on the Canadian Pacific and the Intercolonial railroads (Map New Brunswick, C 3). The river is navigable for large vessels to this point, 84 miles from its mouth in the Bay of Fundy, small steamers go 65 to 75 miles farther up. The city, built on a low point of land nearly surrounded by hills, is well laid out and has elegant public buildings, among which are the residence of the Lieutenant Governor, Parliament buildings, Government House, Legislative Library, exhibition building, Victoria Hospital, customhouse, the New Brunswick University, the provincial normal school, a collegiate and other schools. Fredericton is the seat of an Anglican bishopric, and the cathedral is a handsome edifice. The city is the centre of a lumbering district. The manufactured products include flour, canoes, motor boats, boots and shoes, shoe-packs and lariguns (tanned leather shoes and boots for lumbermen), foundry and machine-shop products, leather, lumber, and cotton. The United States has a consular agent here. Founded about 1740, the village was first called St. Anne. After New Brunswick became a British possession, Sir Guy Carleton, who in 1786 was appointed Governor-General of all the British North American provinces, in that year laid out the principal streets of St. Anne to run parallel with the river, changed the name to Fredericton, and two years later it became the capital of the province. It was incorporated in 1849. Pop., 1901, 7117, 1911 7208.

FREDERIKSBERG, frâ'dër-iks-bêrg. A western suburban municipality of Copenhagen, Denmark, with which it is connected by the wide Fiederiksberg Allee, lined with pleasure gardens (Map Denmark, F 3). It is a handsome residential place, with the beautiful park of Søndermarken, a zoological garden, the Ny-Carlsberg Glyptothek, an art museum, and the Frederiksberg Palace, constructed in Italian style, now used as a military college. The palace was built by Frederick IV in the first half of the eighteenth century, and stands in a prominent hill park commanding a fine and extensive view. Near by are the Royal Porcelain Works and also a faience factory, in another adjoining territory are two great breweries. Pop., 1901, 76,237, 1911, 97,237. It became a part of Greater Copenhagen during the first decade of the twentieth century.

FREDERIKSBORG, frâ'dër-iks-bôrg. A Danish castle, situated on three islands of a lake of the same name, on the island of Zealand, 22 miles north-northwest of Copenhagen. It was built in 1602-20 in Danish Renaissance style, by Christian IV of Denmark, on the site of an older building of Frederick II. Since a fire in 1859 it has been restored as a national historical museum, with handsome rooms, notably the knights' hall and the dining hall. Its church was formerly the coronation place and contains a king's oratory, with 23 Passion paintings by Bloch. Its gardens are laid out in French style. It has fine paintings and mural decorations by J. Ovens, and sculpture by De Vries and L. P. Sweis.

FREDERIKSHALD, frâ'dër-iks-hal'. A fortified seaport of Norway, beautifully situated on

the Idefjord, where the Tistedalselv falls into it, about 85 miles south-southeast of Christiania (Map Norway, D 7). It has a Latin school. It exports a considerable amount of wooden ware, and is one of the centres of the timber traffic for East Norway. The harbor is good and is guarded from an eminence by the fortress of Frederiksten and the smaller Glydenlove fort. A monument marks the place where Charles XII fell in an attempt to capture the town in 1718. The town withstood a two years' siege by the Swedes (1658-60). Pop, 1900, 11,936, 1910, 11,992.

FREDERIKSHAVN, frä'dër-iks-ha'v'n. A seaport town of Jutland, Denmark, situated on the Cattedagat, 52 miles northeast of Aalborg (Map Denmark, D 1). It has an excellent harbor, free from ice throughout the year, with accommodation for vessels of 20-foot draft. The chief imports are wood, grain, coal, iron, yarn, and cotton goods, while the exports consist of dairy products, beef, pork, fish, oysters, and eggs. Regular steamship lines run to the cities of Sweden, to England, and to Copenhagen. It is one of the youngest of Danish towns, having received municipal rights in 1818. Pop, 1901, 6478, 1911, 7916.

FREDERIKSTAD, frä'dër-ik-stad. A seaport of Norway, situated at the mouth of the Glommen, 58 miles southeast of Christiania (Map Norway, D 7). It is an important centre for the lumber trade with Germany, Holland, and France, the wood being rafted down the Glommen. It is a very busy industrial centre, manufacturing bricks, lumber, engines, and boilers, ships, cotton and woolen goods, and chemicals. It was founded in 1570 and was for a long time strongly fortified. Near it is Hanko, the most fashionable of Norwegian watering places. Pop, 1900, 14,635, 1910, 15,597.

FREDMAN, THE. A name sometimes used by the Swedish poet Karl Mikael Bellman (q v).

FREDONIA. A city and the county seat of Wilson Co., Kans., 91 miles east by south of Wichita, on the Frisco, the Atchison, Topeka, and Santa Fe, and the Missouri Pacific railroads, and on the Fall River (Map Kansas, G 8). It is the centre of an agricultural and stock-raising district and has a supply of natural gas and oil. Its industrial establishments include brick and cement works, a linseed-oil mill, window-glass and ice plants, and a foundry. The water works and sewage system are owned by the city. Fredonia has adopted the commission form of government. Pop, 1900, 1650, 1910, 3040.

FREDONIA. A village in Chautauqua Co., N. Y., 45 miles southwest of Buffalo, on the Dunkirk, Allegheny Valley, and Pittsburgh Railroad (Map New York, A 6). It is the seat of a State normal school and has the D. R. Barker Free Library. The village has extensive nurseries, wine cellars, seed companies, canning establishments, and grape-juice and patent-medicine factories. It is the centre and chief village of the famous grape belt of western New York. The water works and electric-light plant are owned and operated by the municipality. One of the oldest villages in western New York, Fredonia was settled in 1803 and incorporated in 1829. Natural gas was utilized for lighting the village as early as 1821. Pop, 1900, 4127, 1910, 5285.

FREDRO, frä'drô, ALEXANDER, COUNT (1793-

1876). A Polish playwright, born at Surochov, Galicia. For several years he served in the army, and at the end of that time (1814) he visited Paris and there studied the French theatre. Upon his return to Poland he produced 18 comedies, which were played with success. He is praised for his depiction of comic types and for the entirely national spirit of his work. His plays were collected and published in 1877 and again in 1880. Some of his plays have been translated into German.—His son JAN ALEXANDER (1829-91), born in Lemberg, was also a dramatic author. His comedies had some success, but he was far from equaling his father. His works were published in 1881.

FREE BENCH (*francus bancus*). An ancient form of dower existing by custom, and not by common law, in certain manors in England. The right of free bench was independent of endowment and was a purely customary provision for the wife, who became entitled to it at once upon her husband's death, without waiting, as is still the case with ordinary dower, for its assignment by the heir. Coke says "This right is called *francus bancus*, to distinguish it from other dowers, for that it cometh freely, without any act of the husband's or assignment of the heir" (Co Litt 94, b). The custom varied in different manors, the widow being entitled to the whole of her husband's lands in some, while in others she received one-half or one-third only. The right applied only to estates of inheritance held by the tenure of free and common socage and was usually, if not always, limited to the period of widowhood and the good behavior of the wife (*dum sola et casta viverit*). See DOWER.

FREE CHURCH OF ENGLAND. See REFORMED EPISCOPAL CHURCH.

FREE CHURCH OF SCOTLAND. See PRESBYTERIANISM.

FREE CITIES (Ger *Freistädte*). The name given to the three German cities of Hamburg, Bremen, and Lubeck, which are sovereign states and members of the German Empire. Since the middle of the fourteenth century the term "free cities" has been used for certain German towns, but not always with the same meaning. The designation was applied 1 To cities in the Rhine valley (Cologne, Mainz, Worms, Speier, Strassburg, Basel) and elsewhere which had been under the control of bishops, but had become almost independent in the course of the thirteenth and fourteenth centuries. They enjoyed even greater freedom than the so-called "Imperial" cities. All of these cities have become parts of the larger political divisions. 2 To the Hanse cities—Frankfurt on the Main, Hamburg, Bremen, and Lubeck. These cities were wealthy and became centres of active popular life and of free institutions in the thirteenth, fourteenth, and fifteenth centuries. They maintained their freedom until the time of the Napoleonic wars. By the Congress of Vienna, in 1815, they were restored to their former rights as free cities. Hamburg, Lubeck, and Bremen still retain their privileges under the reconstituted German Empire, but Frankfurt was annexed to Prussia in 1866. Consult Arnold, *Verfassungsgeschichte der deutschen Freistädte* (Gotha, 1854), and Hullmann, *Städtewesen des Mittelalters* (Bonn, 1826-29).

FREE CONGREGATIONS (Ger *freie Gemeinden*). An association of German rationalists. It originated in Saxony in 1841, where

the members were called "Protestant Friends" and "Friends of Light." The immediate occasion was an attempt to discipline a Magdeburg preacher who had expressed heretical views. Early leaders in the movement were Leberecht Uhlich (qv) and Gustav Adolf Wislicenus (qv), both of whom were forced out of the Evangelical church for expressing liberal views. In like manner independent congregations arose in a number of places, and in 1847 a union was effected between them on the basis of a simple profession of faith in God. By this time their gatherings, held symbolically in the open air, had come to number more than 2000, including delegates from England and America. In 1850 they were united with the German Catholics (qv), and in the same year and the years immediately following some 40 congregations were established in the United States, but had a short existence. After the revolutionary movements of the middle of the century several of the German governments undertook to suppress them, partly for political reasons. Many congregations were broken up. Those still in existence in 1859, about 50 in number, under Uhlich's leadership, formed a "Union of Free Congregations in Germany," upon a highly rationalistic basis. Inasmuch as the fullest individual liberty is allowed, the belief of members and congregations varies greatly. There has been a tendency towards radical free thought, and some even deny the existence of a personal deity. At present there are about 22,000 members in the entire association. Consult Kampe, *Geschichte der religiösen Bewegung der neuern Zeit* (Leipzig, 1852-60), and *Friedenker-Almanach* (Gotha, annually).

FREEDEN, frä'den, WILHELM IHNO ADOLF VON (1822-94). A German mathematician and expert on navigation, born at Norden, Hanover, and educated at Bonn and Göttingen. He was director of the school of navigation at Elsfleth, Oldenburg, and later became established at Hamburg, where, in 1867, he founded the German Naval Observatory, which he conducted until 1875. The purpose of this institution is to promote and facilitate maritime intercourse. It comprises the department of maritime meteorology, a bureau of nautical, meteorological, and magnetic instruments, the department of coast meteorology and signal service, and a bureau for testing chronometers. Freedén, who was a member of the Reichstag from 1871 to 1876, founded, with H. Tecklenborg-Bremen, the publication entitled *Ilansa, Zeitschrift für Seewesen*, which he edited until 1891.

FREEDMAN. See FREEMAN AND FREEDMAN.
FREEDMAN'S BUREAU. A "Bureau of Refugees, Freedmen, and Abandoned Lands," established in the War Department of the United States by the Statute of March 3, 1865. This act provided that the bureau was to be maintained through the war and for one year thereafter, and that it should have "the supervision and management of all abandoned lands, and the control of all subjects relating to refugees and freedmen," under "such rules and regulations as may be presented by the head of the bureau and approved by the President." Especially important was the provision authorizing the President to appropriate for the use of freedmen the confiscated and abandoned lands within the Southern States, not more than 40 acres for a period not longer than three years being assigned to each man thus aided. Pro-

visions, fuel, and clothing were, moreover, to be distributed free of charge by the bureau to destitute freedmen and loyal refugees. "The bureau assumed, in short, a general guardianship of the emancipated race, and, backed by the paramount military force of the United States, undertook to play a determining rôle in the process of reorganizing Southern society." The administration of the bureau was placed in the hands of a chief commissioner and his deputies, and in the actual application of the statute much was done with reference to labor, clothing, fuel, provisions, and schools for the beneficiaries of the plan. A second Freedmen's Bureau bill was passed by Congress, Feb. 6, 1866, but was vetoed by President Johnson and was not passed over his veto. Later, however, there was passed over the President's veto the Act of July 16, 1866, which extended for two years the term of the bureau's statutory life, increased its powers, authorized the sale for educational purposes of Confederate public property, and gave to the bureau military jurisdiction over infringements of civil rights secured by the act. In June, 1868, another bill was passed, extending the term of the bureau for one year in unreconstructed States. The bureau's chief work ended on Jan. 1, 1869, and its educational work was concluded a year and a half thereafter. More than \$15,000,000 was spent by the bureau, and, in addition to the general relief afforded, it aided appreciably in the movement for the higher education of the freedmen which resulted in the founding of such institutions as Atlanta University, Fisk University, and Howard University, the last being named after the chief figure in this work, the commissioner of the bureau, Gen. Oliver O. Howard (qv). Widely differing opinions have been, and are, held with regard to the methods used and the results attained by the bureau—some writers maintaining that its work was almost wholly beneficent, others that on the whole much more harm was done than good. However useful and beneficent an institution it may have been, it was cordially detested by the greater part of the white people of the South who saw in the bureau only a diabolical device for perpetuating the national government's control over the South and for the humiliation of the whites before their former slaves. The text of the first Freedmen's Bureau bill may be found in *13 Statutes at Large* (Thirty-eighth Congress), that of the second in *13 Statutes at Large* (Thirty-ninth Congress). For an account of the bureau's work, consult General Howard's report for 1869, published among the executive documents of the House of Representatives, Forty-first Congress, second session. Also consult "The Freedmen's Bureau," in *Atlantic Monthly*, vol. lxxvii (Boston, 1901), and Peirce, *The Freedmen's Bureau* (Iowa City, 1904).

FREEDOM. A borough in Beaver Co., Pa., 25 miles northwest of Pittsburgh, on the Pittsburgh, Fort Wayne, and Chicago Railroad, and on the Ohio River (Map Pennsylvania, A 6). The chief industries are the manufacture of oil, caskets, and monuments. Pop., 1900, 1783, 1910, 3060.

FREEDOM OF THE CITY. The custom, prevalent both in American and European cities, of conferring on a distinguished visitor the privileges connected with municipal citizenship. The names of such honorary citizens or burgesses are entered upon the register of municipi-

pal electors, but they are not entitled, when nonresidents, or not engaged in business in the particular city or town, to exercise the municipal franchise or to be admitted to membership in the governing bodies. The practice of conferring the freedom of the city, which at present amounts to little more than an expression of esteem on the part of the public magistrates, may be traced back to mediæval times, when the principle of freedom of domicile was by no means universally recognized, and cities partook almost entirely of the nature of private corporations, admission into which was hampered by many restrictions. The most usual way of obtaining the privileges of citizenship at that time was by a long term of apprenticeship (seven years as a rule) to one of the recognized guilds, followed by an examination in the principles of the craft, and, where the candidate was successful, enrollment in the ranks of master workmen. In view of so cumbrous a process the presentation of the freedom of the city by a special vote of the magistrates was, in fact, a substantial favor and was granted only in cases where great wealth or renowned citizenship made a man a desirable accession to the list of burghers. See **GUILDS**.

FREEDOM OF THE PRESS See **PRESS**, **FREEDOM OF THE**.

FREE FUGUE. See **FUGUE**.

FREE GIFT See **BENEVOLENCE**.

FREEHOLD A town and the county seat of Monmouth Co., N. J., 33 miles by rail east of Trenton, on the Pennsylvania and the Central of New Jersey railroads (Map New Jersey, D 3). It has a Carnegie library, two military schools, and a park in which is a fine granite monument, 100 feet high, commemorating the battle of Monmouth (q.v.). The town is commercially important as a distributing centre for a farming district and has a large canning factory and manufactories of carpets and rugs, foundry and machine-shop products, and rasps. Freehold was settled about 1735, when county courts first began to be held here, and for many years was known as Monmouth Court House. It was incorporated in 1869 and has adopted the commission form of government. The water works and sewage system are owned and operated by the town. Pop., 1900, 2934, 1910, 3233.

FREEHOLD (Lat. *liberum tenementum*, free holding or tenement). In the classification of estates in land, any estate of inheritance or for life, held by a free tenure. It is distinguished from the copyhold (q.v.) and from the leasehold (q.v.). As thus employed, it is a mere term of classification, but in its origin it was coextensive in meaning with the term "fee," as signifying lands held of some lord by feudal tenure. (See **FEE**, **TENURE**.) The original freehold or fee was the life estate, and the term "freehold" has always been employed by law writers from Littleton down in a special and technical sense, as signifying an estate for life. But its more common use, especially in American law, is as above indicated. Under the feudal system a free holding or freehold was such a tenement as a free vassal might properly hold. The tenure might be military or nonmilitary, and the estate might be corporeal or incorporeal, but the holding must be for life at least, and not for a definite term of years, nor, as in the case of copyhold, at the will of the lord of whom the land was held. For a description of the various

forms of freehold, see **FEE SIMPLE**, **FEE TAIL**, **LIFE ESTATE**. See also **ESTATE**, **FEUDALISM**.

FREEHOLD, CUSTOMARY. See **CUSTOMARY FREEHOLD**.

FREE LANCE (Ger. *freier Landsknecht*, free land trooper, in distinction from the Swiss mountaineers, but confused with *Landsknecht*, lance trooper). In the later Middle Ages and early modern times, one of the roving companies of knights and men at arms who wandered from state to state, selling their services to any lord who was willing to purchase their aid. They played their most prominent part in Italy, where they were known as *condottieri* (q.v.). See **BRABANCONS**.

FREE LAND A borough in Luzerne Co., Pa., 18 miles (direct) south of Wilkes-Barre on the Lehigh Valley Railroad (Map Pennsylvania, K 4). The borough contains the Mining and Mechanical Institute, Girls Industrial School, and the Hill Observatory. It is in a coal-mining and agricultural region and has a foundry and machine shops, a brewery, hames and overall factories, and a silk mill. Pop., 1900, 5254, 1910, 6197.

FREE LIBRARIES See **LIBRARIES**.

FREEMAN A town in Hutchinson Co., S. Dak., 45 miles southwest of Sioux Falls, on the Chicago, Milwaukee, and St. Paul Railroad (Map South Dakota, G 4). It is in a purely agricultural region and contains the South Dakota Mennonite College and a fine city hall. The water works are owned by the town. Pop., 1900, 525, 1910, 615.

FREEMAN, ALICE ELVIRA See **PALMER, ALICE (FREEMAN)**.

FREEMAN, EDWARD AUGUSTUS (1823-92). An English historian. He was born at Mitchley Abbey, Harborne, Staffordshire, Aug. 2, 1823, and at an early age was left an orphan. Under the care of his paternal grandmother he received education in various private schools and after a course of private tuition received a scholarship at Trinity College, Oxford, in 1841. In 1845 he graduated and the same year was elected fellow of his college. In 1847 he married Miss Eleanor Gutch, daughter of his former private tutor. The following year, with an accession to his private fortune, he retired to Dursley, Gloucestershire, and applied himself to a life of historical study and research. With a special predilection for ecclesiastical architecture, in 1849 he published *A History of Architecture*. He contributed articles and reviews to the *Guardian*, the *Saturday Review*, and other periodicals, and also published pamphlets, all noted for their scholarship, accuracy, and correction of popular errors, which kept his name prominently before the reading public. In 1857 and 1858 he was appointed examiner in the School of Law and Modern History at Oxford, a position he again held in 1863, 1864, and in 1873. In 1860 he had removed to Someleaze, near Wells, Somerset, where for some years he acted as county magistrate, and, with political aspirations as a Gladstonian Liberal, in 1868 unsuccessfully stood as member of Parliament for Mid-Somerset. In 1863 appeared the first volume of his *History of Federal Government from the Foundation of the Achaean League to the Disruption of the United States* (a work that he left unfinished), in 1867 was published the first volume of his *History of the Norman Conquest* (6 vols., 1867-79), which established his position among Eng-

lish historians. He was created D.C.L. of Oxford in 1870, in 1874 received the honorary degree of LL.D. from Cambridge, and in 1880 was elected honorary fellow of his college at Oxford. For the better elucidation of his subjects he traveled extensively, visiting the places connected with the histories he was writing. In the winter of 1881-82 he visited the United States on a lecturing tour, which resulted in the publication of *Introduction to American Institutional History* (1882), *Lectures to American Audiences* (1882), and *Some Impressions of the United States* (1883). He succeeded Bishop Stubbs of Chester as regius professor of modern history at Oxford in 1884, and the same year was created honorary LL.D. of Edinburgh University. From 1886 to 1890 failing health impelled him to spend the winters of each year in Sicily, where he wrote his *History of Sicily* (4 vols., 1891-94). While traveling in Spain he died of smallpox at Alicante, March 16, 1892. Freeman was the leader of the Teutonic school of English history and a voluminous writer. His principal work, *The History of the Norman Conquest*, in impartial, exhaustive treatment and unimpeachable accuracy, is one of the greatest monuments of historical research. It is as a political historian that he is best known. Among his writings not already mentioned are *History and Conquest of the Saracens* (1856), *Comparative Politics* (1873-96), *Growth of the English Constitution* (1876), *The Ottoman Power in Europe* (1877), *Historical Geography of Europe* (1881), *English Towns and Districts* (1883), *The Reign of William Rufus* (2 vols., 1882), *Western Europe in the Fifth Century*, *An Aftermath* (1904), *Western Europe in the Eighth Century* (1905). Consult Stephens, *Life and Letters of Edward Augustus Freeman* (2 vols., London, 1895), and Bryce, *Studies in Contemporary Biography* (New York, 1903).

FREEMAN, JAMES (1759-1835). An American Unitarian clergyman. He was born in Charlestown, Mass., graduated at Harvard in 1777, and in 1782 became a reader in King's Chapel, Boston. Soon he became a Unitarian, and in 1785 the people of his church altered their prayer-book in accordance with his views and became the first Unitarian church in the United States. He was ordained (1787) by his own congregation, since the Bishop refused to ordain him, and remained rector of King's Chapel for 39 years. In 1811 he received the degree of D.D. from the University of Cambridge. He was a scholarly and philanthropic man and was one of the founders of the Massachusetts Historical Society. Consult a sketch of him in that Society's *Collections*, 3d series, vol. v (Boston, 1836).

FREEMAN, JAMES MIDWINTER (1827-1900). An American clergyman and writer. He was born in New York City and was educated at Wesleyan University and at Mount Union College (Ohio). He entered the Methodist ministry and in 1872 became assistant editor of various Sunday-school and tract publications of the Methodist Episcopal church. Under the pseudonym of "Robin Ranger," Freeman wrote several books for children. His other works include *Use of Illustration in Sunday School Teaching* (1867); *Handbook of Bible Manners and Customs* (1874); *A Story History of the English Bible* (1879).

FREEMAN, JOHN RIPLEY (1855-). An American civil and mechanical engineer, born

at West Bridgton, Me. Graduating from Massachusetts Institute of Technology in 1876, he was an assistant engineer for 10 years, chief engineer of the Associated Factory Mutual Insurance Company in 1886-96, and after 1886 also consulting engineer on water supply and mill construction for various large corporations, and on water supply for numerous cities, among them New York, Boston, Los Angeles, Baltimore, and San Francisco. His advice was sought also in connection with the Panama Canal locks and dams, and by the Canadian government on waterpower conservation. In 1902-03 he was vice president of the American Society of Civil Engineers, whose medal he twice received for the best yearly contribution to its *Transactions*, and in 1904 he served as president of the American Society of Mechanical Engineers.

FREEMAN, MARY E WILKINS. See WILKINS.

FREEMAN, MRS. The name assumed in jest by Sarah Jennings, wife of John Churchill, Duke of Marlborough, during her friendship and correspondence with Queen Anne. The name was adopted shortly after the beginning of the acquaintance in 1683. Queen Anne adopted that of Miss Morley.

FREEMAN, NATHANIEL (1741-1827). An American physician and jurist, born at Dennis (Barnstable County), Mass. He settled at Sandwich (also in Barnstable County) in 1763. He studied both medicine and law, served in the American army during the Revolution, commanding a militia regiment in the Rhode Island expedition, and from 1781 to 1791 was brigadier general of militia. From 1795 to 1799 he was a member of Congress. He was also in the State Legislature of Massachusetts, and long a judge of probate and of the Court of Common Pleas.

FREEMAN, SUSANNA. See CENTLIVRE, SUSANNA.

FREEMAN AND FREEDMAN. In the most general acceptance of these terms, the first implies one who has inherited the full privileges and immunities of citizenship, the second, one who has been delivered from the restraints of bondage, but who, usually, is not placed in a position of full social or even political equality with him who was born free. With the Romans the equivalent for freeman (*liber homo*) comprehended all classes of those who were not slaves, but the distinction was preserved by the application of the term *ingenius* to him who was born free, and of *libertinus* to him who, being born in servitude, was emancipated. As the organization of Roman society survived the convulsions of the Middle Ages to a far greater extent in the towns than in the rural districts, where the institutions of feudality almost entirely superseded it, it is in the borough and other municipal corporations of continental Europe that *freemen* still were found comprising persons inheriting or acquiring by adoption, purchase, or apprenticeship the rights of citizenship. The idea of a freeman was by no means peculiar to the Roman or Romanized population of Europe, on the contrary, it belonged to the constitution of society in all the Indo-Germanic nations. Among those branches of them commonly known as Teutonic, it was generally based on the possession of some portion of the soil. Thus, in Anglo-Saxon England "the freeman was strictly the freeholder, and the exercise of his full rights as a free member of the community to which he belonged became

inseparable from the possession of his holding in it" Consult Green, *The Making of England* (London, 1882), and Crumley, *On the Social Standing of Freedmen as Indicated in the Latin Writers*, part 1 (Baltimore, 1906) See ANGLO-SAXONS, CITIZEN, SLAVERY

FREE/MA/SONRY. A modern name of popular usage designating the principles of the Order of Freemasons Formerly the word *Masonry* alone was employed and it is still used in the writings, history, and ritual of the craft The term "Freemasonry" seems to have risen from the fact that only *free* men were eligible to the order, and that they were required to be elected with practical unanimity The members then denoted themselves "Free and Accepted Masons", but the public curtailed this to Freemasons and the order to Freemasonry See MASON, FREE

FREE METHODISTS See METHODISM

FREE PORT (Ital *porto franco*) A harbor where the ships of all nations may enter on paying a moderate and uniform toll and load and unload Free ports form depots where goods are stored at first without paying duty, these goods may then be either reshipped for export on paying a mere transit duty, or they may pay the usual full customs of the country and be admitted for home consumption Free ports thus facilitate transit trade and form, as it were, a foreign district within a state See WAREHOUSING SYSTEM

FREEPORT A city and the county seat of Stephenson Co., Ill., 113 miles by rail west by north of Chicago, on the Pecatonica River, and on the Chicago and Northwestern, the Illinois Central, the Chicago Great Western, and the Chicago, Milwaukee, and St Paul railroads (Map Illinois, E 1) It contains the St Vincent's Orphanage and a public library There are railroad shops and manufactories of organs, wagons, buggies, bicycles, windmills, novelties, gasoline engines, and paints Freeport was settled in 1835 and chartered in 1885 The government is administered by a mayor and a unicameral council Pop., 1900, 13,258, 1910, 17,567, 1914 (U S est.), 19,018, 1920, 19,669 Here in 1858 occurred the debate between Lincoln and Douglas in which Douglas enunciated his famous "Freeport heresy" or "doctrine," which was to the effect that, in spite of the *Dred Scott* case (qv), any Territory might virtually exclude the slave system by passing "unfriendly" police laws incompatible with its existence This doctrine alienated many of Douglas's former supporters and greatly weakened him in the presidential campaign of 1860

FREEPORT A village on Long Island, in Nassau Co., N Y., 20 miles east of New York City, on the Long Island Railroad (Map New York, B 3) It is essentially a residential place and contains a high school and two large clubhouses Fishing is carried on to some extent The water works and electric-light plant are owned by the village Pop., 1900, 2612; 1910, 4836

FREER, CHARLES LANG (1856-1919) An American capitalist He was born at Kingston, N Y., and was educated in the public schools Until his retirement he was engaged in railroad and manufacturing enterprises at Detroit, Mich He made a large art collection, which he presented to the Smithsonian Institution at Washington, D C The University of Michigan conferred on him the honorary degree of A M

FREE SCHOOLS See COMMON SCHOOLS

FREE SHIP. See ARMED NEUTRALITY, THE, DECLARATION OF PARIS.

FREE/SIA A genus of bulbous plants of the family Iridaceae, comprising two species, natives of the Cape of Good Hope, which during the closing quarter of the nineteenth century became widely popular as greenhouse and window-garden plants for winter blooming The leaves are long and grasslike, the long scape, bent at an angle, bears at the top five or six pale-yellowish or white erect tubular flowers of exquisite fragrance Perhaps *Freesia* is the easiest and most satisfactory bulbous plant to grow, since it requires even less attention as to soil and watering than the hyacinth, and unless kept too dry, or watered too heavily, will produce flowers without forcing in from six to eight weeks The principal producing centres of freesias are the Channel Islands, California, and Bermuda, where the finest bulbs are said to grow For illustration, see Colored Plate of IRIS

FREE-SOIL PARTY, THE The name of a political party in the United States, which was formed in 1848 and became merged in the Republican party in 1856 The activity of the Abolitionists (qv) throughout the decade of the thirties, the energetic though indirect championing of the equal rights of all men by conservative leaders, such as John Quincy Adams, and the controversy over the extension of slavery in connection with the admission of Texas, brought the question of the further extension of the restriction of slavery once more into the foreground in 1844, although both of the existing parties, Democrats and Whigs, virtually refused to recognize the existence of any such question Within the Northern wing of each party there arose, therefore, groups of workers, such as that led by S P Chase in Ohio, who aimed to commit their party to the principle of opposition to the further extension of slavery in the national Territories The issue was forced by the introduction, in the House of Representatives, of the so-called "Wilmot Proviso" (qv) in 1846 by David Wilmot, a Democratic member from Pennsylvania, as an amendment to a bill in Congress making an appropriation to negotiate peace with Mexico The proviso passed the House, but failed in the Senate Particularly in Massachusetts was a vigorous effort made to make the Whig party a free-soil party, and the bitter contest between the "Conscience" Whigs and the "Cotton" Whigs enforced upon the former the fact that for them there was no place within their old party, and that, in order to establish their principle, they must found a party whose dominant purpose should be opposition to slavery extension The necessity for this was still further emphasized by the refusal of both national conventions of 1848 to indorse the principle of the Wilmot Proviso, and so in August of 1848 there met at Buffalo the first national convention which stood for this principle, and which comprised in its membership the "Barnburner" Democrats of New York, who had bolted their national convention, members of the former Liberty party (qv) under the leadership of Chase, and the "Conscience" Whigs of Massachusetts, led by Charles Francis Adams and Charles Sumner By this convention Van Buren and Adams were named as the national ticket, and resolutions were adopted which concluded "That we inscribe on our banner 'Free

Soil, Free Speech, Free Labor, and Free Men,' and under it will fight on and fight ever, until a triumphant victory shall reward our exertions." Although the ticket received no electoral vote, and only 291,263 popular votes (sufficient to turn the scale in favor of Zachary Taylor as against Lewis Cass), the party secured such local advantages that it was able to send Chase to the Senate in 1849 and Sumner in 1851. On the other hand, the alliance with the "Barn-burners" was temporary, and so hopeless was the outlook that Chase formally joined the Democrats in the State elections in Ohio in 1851. In 1852 the Free-Soil candidate, John P. Hale of New Hampshire, received only 156,149 votes. In that year many Northerners were reconciled to their original parties by the "finalty" planks and by the hope of thus preventing further discussion of slavery extension. When this hope proved ill founded, by the Kansas-Nebraska struggle, old party lines were broken, and the principles of the Free-Soil party were largely adopted by the new Republican party. Consult J. C. Smith, *Liberty and Free Soil Parties in the Northwest* (New York, 1897), Curtis, *The Republican Party*, vol. 1 (ib., 1904), T. H. McKee, *National Conventions and Platforms of All Political Parties, 1789-1905* (6th ed., Baltimore, 1906), and see LIBERTY PARTY, REPUBLICAN PARTY.

FREE SONS OF ISRAEL, INDEPENDENT ORDER OF. A Jewish fraternal and benevolent society, with headquarters in New York City, founded on Jan. 10, 1849. It has three grand lodges and 89 subordinate lodges, distributed throughout the United States. Up to 1914 it had paid to widows and other beneficiaries \$6,559,355, and at that date had 8745 members.

FREESTONE. A name given to those sandstones which have a homogeneous texture and can be cut readily in all directions so as to be easily reduced to any form required for architectural uses. It occurs in rather thick beds, without minor division planes or directions of cleavage. The name is sometimes applied also to limestones that have similar physical characters. See SANDSTONE, BUILDING STONE.

FREE THEATRE. See THÉÂTRE LIBRE.

FREE THINKER. One who rejects authority, particularly that of ecclesiastical tradition, in the formation of his religious opinions. The term came into common use early in the eighteenth century, after the publication of Anthony Collins's *Discourse of Freethinking*, occasioned by the *Rise and Growth of a Sect called Freethinkers* (London, 1713), and was applied particularly to the English Deists. (See DEISM.) It has been used to designate rationalists, infidels, or skeptics. Consult J. M. Robertson, *A Short History of Freethought, Ancient and Modern* (2d ed., 2 vols., London, 1906), and J. B. Bury, *A History of Freedom of Thought* (ib., 1913). See ESPRITS FORTS.

FREE TOWN. The capital of the British West African Colony of Sierra Leone, situated on the left bank of the Sierra Leone River, about 5 miles from the coast and 33 miles by rail from Songotown (Map. Africa, C 4). It lies on low ground and is separated from the interior by a mountain chain. It is the headquarters of the British forces in West Africa and a second-class imperial coaling station. It has a fine harbor protected by several batteries of heavy modern ordnance. There are a cathedral, a governor's palace, a Supreme Court, a tech-

nical school, and Fourah Bay College, an excellent institution affiliated with the University of Durham. Freetown is the greatest seaport in West Africa, and has a considerable export trade in India rubber, palm oil, gums, nuts, and ginger, gold and silver ornaments and filigree work are skillfully made by native experts. Freetown was formerly so unhealthy that it was called "the white man's grave," but since the neighboring marshes have been drained or filled in the health of the town has notably improved. Pop., 1901, 34,463, 1911, 34,090, including only about 500 Europeans.

FREE TRADE. As first used in English literature, the term "free trade" designated trade open to all merchants, as distinguished from that monopolized by chartered trading companies. In course of time restrictions other than monopolies attracted attention, and the term was extended to cover trade unhampered by any sort of governmental regulation. It was even used by some writers in a sense practically synonymous with "free competition." During the eighteenth century customs duties became the favorite mode of trade restriction, and "free trade" became trade carried on in defiance of customs regulations. The free traders of this period were the class we now call smugglers. At present "free trade" designates trade that is either entirely unrestricted or restricted only in ways that afford no protection (q.v.) to home industries. The former exists only in the imagination of economists, as no government has ever attempted to put it in practice. The latter, on the other hand, is actually realized in the policy of the United Kingdom. It is to it, rather than to absolutely free trade, that the present article refers.

Although advocates of freedom of trade were not lacking in Europe before the eighteenth century (e.g., De la Croix, in France, in 1623, and Nicholas Barbon, in England, in 1696), it was not until then that any considerable number of persons of influence declared themselves for such a policy. The honor of having led in the crusade against the restrictions of the mercantile system, which was begun about 1750, belongs to the group of French writers called Physiocrats (q.v.). By them free trade was for the first time presented as an essential principle of a well-rounded system of economics. The formula, *laissez-faire, laissez-passer*, first popularized by the liberal Protectionist Gournay (q.v.), was adopted by the Physiocrats and given an absolute character as a universal rule of state policy. Turgot, Finance Minister of Louis XVI in 1774, attempted to realize some part of the programme of the Physiocrats by abolishing many of the internal restrictions upon trade, notably in the corn trade.

At the same time that the Physiocrats were formulating their doctrine in France (1752-63), Adam Smith was proving to his students at the University of Glasgow that the restrictions on trade, which were universal in Europe at this period, were obstacles rather than aids to a country's industrial progress, and that freedom of trade was the policy best adapted to promote the general interest. The distinguishing merit of his famous *Wealth of Nations*, regarded as a contribution to the literature of free trade, was that it showed exhaustively the evil results due to each kind of trade restriction advocated by the Mercantilists. To this part of his task Adam Smith devoted six of the nine chapters

of his fourth book, and his treatment of "protective import duties," of "drawbacks," of "bounties," of "treaties of commerce," and of "colonial restrictions" was so convincing that it did even more than the positive arguments in favor of free trade, contained in other parts of his work, to discredit the policy of trade restriction, which in 1776 still commanded the support of nearly all classes. But changes were at work, even as Adam Smith wrote, which were destined to convert many of the very merchants and manufacturers of whom Adam Smith despaired to the doctrine which he advocated.

The first prominent statesman to show the influence of Adam Smith's teaching was William Pitt the Younger. To him is ascribed the clause in the Act of Union with Ireland (1800) providing for complete freedom of trade between the two countries after 1820. Although this provision was not carried out, free-trade opinion had made such progress by the latter year that the merchants of London, headed by Thomas Tooke, presented a petition to Parliament in favor of revising the tariff in the direction of freer trade. An important factor in bringing about this result was the corn-law controversy carried on between the well-known economists Malthus and Ricardo in 1814-15, and the publication in 1817 of the latter's *Principles of Political Economy*. Ricardo put the theoretical argument in favor of free trade in a clearer and more convincing form than had Adam Smith. Furthermore, he enjoyed the advantage of being known as a practical and very successful man of business rather than as a mere closet philosopher.

Official recognition of the growing influence of free-trade sentiment was accorded in 1823 by the appointment of William Huskisson to the presidency of the Board of Trade. Through his initiation Parliament passed several important statutes from 1823 to 1828 mitigating the severity of the navigation acts, reducing the number of dutiable articles, and scaling down the rates on those which continued to be taxed. The reform of Parliament in 1832, and of the Poor Law in 1834, diverted attention temporarily from the tariff question, but a crop failure in 1836 again brought the corn duties prominently to the front. Early in 1837 an Anti-Corn Law Association was formed in London by men prominent in public life. The following year a similar association was organized in Manchester, and in 1839 these associations, and others which had been formed in different parts of England, were fused into the National Anti-Corn Law League. From that year until 1846, when the repeal of the Corn Laws was definitely entered upon, agitation for free trade was carried on continuously, and with ever-increasing enthusiasm and confidence. The leaders in the movement were Richard Cobden and John Bright, representatives of the manufacturing interests of Manchester. It was this circumstance which gave rise to the custom, still common in Germany, of applying the designation "Manchester School" to the English advocates of free trade, who are credited with more extreme *laissez-faire* views of government than even Cobden and Bright really entertained. See BRIGHT, JOHN, COBDEN, RICHARD, CORN LAWS.

In truth, there was good ground for opposition to the policy of protection as practiced by England prior to 1846, quite aside from the general question of the advantages of free trade. The

most galling of the protective duties were on the food materials which entered into the everyday consumption of the English laborer. Under the English land system the high prices for agricultural products which resulted from the grain duties redounded almost entirely to the benefit of the landholding aristocracy. The laboring masses had to pay more for bread than was paid in neighboring countries in order that the landholding class might enjoy high rents. Meantime manufacturers had to pay wages adjusted to the high cost of living and see themselves outstripped in foreign markets by the rival manufacturers of other countries who bore no such burden. It was hard to make such a policy seem either wise or just in a country which was coming to depend more and more for its prosperity upon the success of its manufacturing industries. In fact, the system was doomed from the time that the Reform Act of 1832 gave representation in Parliament to the manufacturing towns of the north, and the country needed only a clear demonstration of the way in which the grain duties actually worked to induce it to demand their abolition. This demonstration was given in 1845, when the potato famine in Ireland cut off one important article of diet, and the grain duties were seen to stand like a dead wall between the starving masses of Great Britain and the abundant food supplies to be had from the Continent. At this crisis Sir Robert Peel, who had long acknowledged free trade to be the goal towards which the policies of all countries should be directed, refused to stand out longer against the demands for repeal. He was unable to carry his colleagues in the ministry with him, but was soon recalled to form a new cabinet, under which, after a long fight, the obnoxious duties were reduced and their ultimate abolition was brought about by the Act of Parliament of June 26, 1846. The present policy of complete nonprotection was introduced in 1869.

The following table indicates the progress in the reduction and simplification of the British tariff made from 1787 to 1876.

YEAR	Principal articles dutiable	Minor articles dutiable	Total articles dutiable
1787	290	1135	1425
1826	432	848	1280
1841	564	488	1052
1849	233	282	515
1855	153	261	414
1861	19	123	142
1876	10	32	42

In June, 1914, there were 12 distinct articles on the dutiable list, viz., cocoa, coffee, chicory, dried fruit, molasses, sugar, tea, tobacco, wine, beer, glucose, and spirits.

The present policy of England realizes the free-trade ideal of imposing no duties that can tend to protect or encourage home industries by means of the following expedients:

1 Most of the dutiable goods (e.g., coffee, tea, cocoa, wine, etc.) are such as cannot, for climatic reasons, be profitably produced in England.

2 The duties on tobacco, a commodity which might be produced in England, are rendered non-protective by the simple prohibition of such production in the United Kingdom. This policy

dates from the reign of Charles II and has become so familiar as to involve little or no hardship.

3 The duties on goods like beer, spirits, etc., which are produced in England, are exactly offset by internal-revenue duties which place the home producer in the same position, so far as taxation is concerned, as the foreign producer. The practice of storing such goods, whether produced at home or imported, in bonded warehouses, makes the administration of this policy easy. The only exceptions to the general principle that no favor shall be shown to home as distinct from foreign producers are in connection with ship subsidies for the benefit of the merchant marine, and certain slaughterhouse regulations which put foreign producers of live stock at a disadvantage. The former is defended as a necessary feature of the postal system, and the latter on sanitary grounds.

Extended attention has been given in this article to the free-trade policy of England, because it is the only important industrial nation to follow such a system. Its example is followed by British India, Hongkong, and the Straits Settlements. On the continent of Europe, Holland and Belgium have tariffs that are only slightly protective. All other European countries and all other countries outside of Europe, however, are committed to the policy of protection. It is thus not far from the truth to characterize free trade as the British policy, in distinction from protection, which is the policy of the rest of the world.

In presenting the arguments in favor of freedom of trade, we will begin with the advantages claimed for this policy and conclude with the disadvantages attributed to the opposite policy, protection.

As Adam Smith long ago pointed out, a principal cause of the industrial progress of the world is the division of labor and the specialization and organization which accompany it. Many men, each working at a special task and sharing his products with his fellows, can produce vastly more in a given time than the same number, each trying to produce for himself all the things that he requires. But one condition of the division of labor is opportunity to exchange one's special products for the needed products of others. *Free exchange* thus gives the widest extension to the division of labor. Obstacles to free exchange prevent the would-be specialist from giving all of his time to the occupation for which he is best fitted, because they prevent him from disposing of his products advantageously and compel him to produce a variety of things for himself or else go without them. When such obstacles are natural—as barriers to the transportation of goods from one mountain valley to another—the situation is unfortunate, but perhaps irremediable. When they are artificial—as are the octroi duties which prevent the free exchange of the products of town and country in certain European countries—they should be condemned. But the same reasons that make a free exchange of goods within a country advantageous make freedom of trade between nations desirable. Political boundaries do not alter the essential nature of exchanges, nor the benefits that accrue to society from having them as free as possible. Foreign trade, like domestic trade, is at bottom an exchange of goods for goods, in which less-desired commodities are given for more-desired com-

modities, to the mutual advantage of both parties to the transaction. As different individuals are unequally fitted to carry on different pursuits, and gain an advantage by an arrangement which allows each to follow his bent, so different countries are unequally adapted for different industries. Freedom of trade, which permits the capital and labor of each country to find employment in those industries for which it is best fitted, serves to increase the aggregate output of goods in the same way that free exchange does in the case of individuals. From it there results a "territorial division of labor," by which each part of the world is devoted to those industries for which nature has adapted it, and through which the aggregate productiveness of the world's labor and capital is immensely increased. The chief purpose of foreign trade is to enable the world to benefit from this territorial division of labor—to permit, e.g., a country like Brazil to produce coffee, not merely for its own inhabitants, but for the world, a country like Cuba to produce sugar, a country like Italy to produce olives, fruits, and silk, a country like the United States to produce corn, wheat, and the important metals. The greater the freedom of trade between countries, the greater the inducement which is held out to each to use its labor and capital in the ways calculated to contribute most to the world's wealth.

In spite of the above advantages of freedom of trade, modern countries persist in maintaining their protective systems. Advocates of free trade condemn protective duties on several grounds. Their tendency, it is urged, is to divert labor and capital from unprotected industries, where they must otherwise find investment, to the protected industry. But this must mean curtailed production. If it was desirable to invest in the protected industry, business men would have done so without any encouragement. That they needed encouragement is proof positive that the favored industry can only be carried on at a national loss. The protective duty cannot cause labor and capital to spring up out of the ground. All it can do is to influence the use to which the available supplies of labor and capital are put. These supplies set a limit to the amount of industry that can be carried on. If diverted from industries not needing protection to those requiring it, the available labor and capital must produce less in the aggregate. The policy involves, therefore, a national sacrifice. Unless good reasons for such a sacrifice are advanced, protection must stand condemned. Of course protectionists have reasons for their policy which they consider good, but to advocates of free trade they seem inadequate.

Other arguments against a protectionist policy, and therefore in favor of free trade, are beginning to be urged in the United States. First, protection is condemned on political grounds. Its tendency is to rear up a group of favored industries. Business men interested in these industries have a special inducement to watch tariff measures which others in the community lack. They are too apt, under these circumstances, to become lobbyists and corruptionists. Through their representatives, charged with shaping the tariff policy, are subjected to influences from which legislators ought to be exempt. Secondly, protection is accused of being in practice a policy of change. To be effective protective duties must adapt themselves to changing

industrial conditions. But changes are always disturbing to business and at times disastrous. Free trade, by making no discrimination between the home and the foreign producer, does not subject business to arbitrary fluctuations. Thirdly, protection is criticized on financial grounds. Since the purpose of a protective tariff is not primarily revenue, the income which it affords to the government bears no regular nor constant relation to the latter's financial needs. At times it may burden the public treasury with an awkward surplus, which encourages reckless extravagance on the part of the legislature. At others it may fail to bring in even that necessary minimum without which the business of government must be seriously interfered with. Finally, certain protective duties are attacked as responsible for the trusts (qv). The argument is that without protection the branches of production concerned would have been open to world-wide competition, and that no merely national trust would have served to secure the monopoly powers after which the trusts are supposed to hunger. If protection has created trusts, and trusts are undesirable, protective duties ought to be reduced, it is urged, until the offending trusts feel the wholesome restraints of foreign competition. The conclusiveness of these arguments against protection can be determined only by weighing them against the counterarguments in favor of that policy, for which see the article on PROTECTION, and references there given.

FREE WILL. A term used in theological and philosophical controversy in various senses. Hoffding, in his *Ethics*, enumerates six different meanings that the term has actually borne. These are: 1. Will that is exempt from the principle of causation, will that is a cause, but not an effect. 2. Will that is not determined by external compulsion. In this sense "I have freedom to go out of my room if I have the key in my pocket and if the door is not barred, otherwise I am not free and must stay where I am." 3. Will that is not determined by inner compulsion. In this sense, if I do what I like, I am acting freely, if, on the contrary, I act from fear, I am not free. The express agent, e.g., who at the muzzle of the revolver determines to hand over the key of the safe is not acting freely. He may indeed know what he

is about and may choose this course as the wisest under the circumstances, but the circumstances are not to his liking. He is not merely physically overpowered, he is also overawed, he prefers the surrender of the valuables committed to him to the loss of his life. He is acting under the compulsion of fear. 4. Will that is not debarred by its nature from making choice of good acts. Certain Christian theologians have maintained that an unregenerate man may indeed choose between possible evil acts, but cannot choose to act morally. Only by divine help, it is maintained, can a man will the good. 5. Will that chooses between different courses. In this sense the question of free will is not one whether the choice is determined, but whether there is really an experience of choice. Thus, if I face a situation which seems to offer alternative courses of action and after deliberation adopt one course to the exclusion of others, my will is free. If, on the contrary, I always act from blind impulse, not having the power to look alternatives in the face and choosing and rejecting, my will is not free. 6. Will that is controlled by ethical motives. Thus, a man who chooses a course because it appeals to him as right is said to act freely, a man, on the other hand, who, even though he considers alternative courses, finally adopts from passion or habit the one he judges to be wrong, is said to be the slave of his passion or of habit. He is not free.

Now, it is evident that with such varying meanings of the term any controversy about free will must be futile unless some one meaning is clearly adopted and maintained as the one at issue. As a matter of fact, controversy on the subject has been confused by these different meanings. Facts which point to freedom in one sense of the term have been urged as proving freedom in another sense, and the obvious connection of morality with one sort of freedom has been interpreted as involving a connection with freedom of another sort. Thus, freedom in the fifth sense above mentioned is a fact of the most indubitable kind. We often do face possibilities and make choice between them. Whatever may be the explanation of such choice, the feeling that the choice is up to us is just as much a fact as any other fact in the world. But to suppose that in making such a choice the will acts without determination by previous events, whether of heredity or environment, i.e., to suppose freedom in the first sense, is to do more than accept the fact, it is to give a theory about this fact. Again, that in civilized communities no one would think of holding a person responsible who is acting under external compulsion, or, again, that we judge more leniently a person who is acting under strong inner compulsion, is often used to prove that moral responsibility demands freedom in the sense of a will that is not subject to causal law. Still again, confusion results from not discriminating between freedom in the sixth sense and freedom in the first sense given above. There is, indeed, a feeling of superiority over circumstance enjoyed by the man who acts from ethical motives, and a sense of slavery often felt by the man who is a hopeless habitué to some evil practice, and yet the freedom of the former man should not be, as it often is, construed as implying that his will is not determined by its antecedents. The classical problem of freedom concerns freedom as the exemption of the will from

causal determination, i.e., freedom in the first sense given above

The history of controversy on this question is too long to be given here, even in outline. In Christian theology St Augustine and Calvin were the protagonists of determinism, and Arminius and Wesley of freedom. In this controversy too often the facts have been subordinated to the necessities of theological consistency or to the supposed implications of the moral judgment. The theological determinists have generally started from the premise of the foreknowledge of God and His causal relation to all events in the world. The conclusion demanded by this premise is that the will is determined. God cannot be the cause of everything without being the cause of our volitions, and He cannot foreknow all events if our own volitions still hang in the balance. The libertarians have started from the fact of moral responsibility, and, confusing two or more senses of the word "freedom," they have concluded that the will is not determined. Even where the argument on this question has been carried on without theological presuppositions, there have often been metaphysical or scientific presuppositions. For instance, it has been assumed that the law of causality holds good in everything and that the law of the conservation of energy has been proved to obtain universally. The laws used by science are, as a matter of fact, only working hypotheses, confirmed in certain test cases coming within the reach of observation, and they have been found useful as guiding principles in further research. But they should never be used dogmatically to prejudge any vital issue.

In the matter before us it should be freely admitted that it has never been demonstrated that the will is universally subject to the law of causality. The actually known facts are compatible with the acceptance of either determinism or free will, and whichever view one accepts one goes beyond known facts, as all generalizations of science do. Now, the science of psychology has generally found it useful to assume determinism, and it is not usually psychological considerations that have led thinkers to believe in free will, although some writers, such as Bergson, do seek to build their defense of freedom on the immediate testimony of experience. But experience does not seem to give any reliable testimony in behalf of freedom in the first sense of the word, it testifies to freedom only in some of the other meanings of the term.

Now, it is probable that, apart from theological considerations, very little opposition to determinism would have arisen were it not supposed that moral responsibility would have to be regarded as an illusion on the deterministic hypothesis. In other words, it is mainly in ethics that the question of freedom is a vital issue. And here it becomes an issue only on one supposition, viz., that to hold a person responsible for his acts is reasonable only if his will is not determined. Such a supposition, however, is either an a priori truth needing no demonstration, or a sheer dogma, or just a working hypothesis. As an a priori truth it will be accepted by those who find it self-evident, it will be questioned by those who do not, and, unfortunately for such an alleged truth, there are many who do not find it self-evident. Self-evidence is a firm prop for any theory only when there is self-evidence. As a dogma, the sup-

position we are discussing is not worthy of scientific consideration. It is only as a working hypothesis, therefore, that it merits attention from the scientific student.

Now, taking the position that it is a working hypothesis in moral judgments, let us ask the inevitable question that always arises in dealing with such hypotheses. Is it the only hypothesis that is satisfactory, or are there others that can equally or better rationalize the facts in question? Let us remember, in answering this question, that morality is fundamentally social (see *ETHICS*), and let us follow the clue afforded by this character of morality. What is the social import of responsibility? May not responsibility be regarded as a method adopted by society to secure from its members the kind of conduct that it regards as desirable? An affirmative answer to this question is what we shall now examine as a working hypothesis opposed to the libertarian hypothesis.

On this hypothesis the tendency to condemn or to punish must be regarded as based on fundamental instincts which are in the first instance in no need of justification. When we act instinctively, we just act, we do not first seek the approval of reason. Reason, when it comes into play upon instincts, comes rather as a check than as an authorization. Instinct may be said to be the motive power, and reason to be a brake to be applied when this power is liable to work harm. We instinctively react hostilely to what displeases us, to what harms us or those in whom we are interested, to what offends our sense of propriety based on custom. Such instinctive reaction needs no more justification than the instinct to eat or to propagate our kind. But the results of this instinctive reaction may in some cases be found by experience to be prejudicial to other interests. Then reason comes in as a check, reason in such a case being nothing but a harmonization of interest with interest, a repression of one interest in favor of another.

This is what seems to have been the actual historical course taken in the historical development of condemnation and punishment. Primitive justice is usually extreme and harsh, i.e., it is simply and blindly instinctive, or it is instinctive with the instinct reinforced and intensified by habit and custom. There is little or no reflection on the consequences of the punishment or condemnation meted out. As time goes on, there is a mitigation of the severity of the hostile reaction, other interests besides blind opposition begin to assert themselves, and in so far as the consequences of inimical reaction are found to be prejudicial to these other interests, the reaction is withheld or modified. Thus, the unmeasured character of savage punishment is reduced to measure by the law of retaliation, which to us seems harsh, but in reality was a great step towards the mitigation of punishment. Again, primitive justice seems not to have taken the offender's intention into account. This was inevitable in clan organizations, where the solidarity of the clan made it necessary to treat each individual as representative of the clan. Only the individual offender intended his offense, but his intention could not be taken into account behind the solid front presented by the unwitting clan in whom the individual is not recognized as such. With the break up of the clan system punishment could become more personal, and the importance of intention could

gain recognition, the uselessness and wastefulness of punishment where there is no malice became obvious. Still again, the harsh punishments which prevailed in England till within very recent times, e.g., capital punishment for grand larceny, gave way before the knowledge that such punishments encouraged rather than discouraged crime. Thus, we find that the degree of responsibility and the things for which responsibility is assessed vary with growing insight into the effects of assessing responsibility and with changes in social organization. All through these changes the prime motive for exacting punishment is anger. Thus anger, when coordinated and fused with other interests, becomes what we call moral indignation. Just as anger in primitive society does not rest upon the conception that the infuriating offender is free, so moral indignation in more advanced communities does not necessarily continue only on license issued by such a conception. Such a conception may be only a bad reason given for a subdued instinct. So the determinist regards it. Moral responsibility for him remains what it historically has always been, an instrument for enforcing ideals. The question for him in exacting punishment and in awarding blame is

FREEZING MIXTURES. Mixtures of substances used to produce low temperatures. The frigorific effect of such mixtures generally

SUBSTANCES (PARTS BY WEIGHT)	Temperature attained	
	Cent	Fahr
100 parts of snow and 33 parts of common salt	-21°	- 5 8°
100 parts of snow and 300 parts of crystallized calcium chloride	-48 5°	-55 3°
100 parts of snow and 100 parts of dilute sulphuric acid (initial temperature, 5° C, or 41° F)	-41°	-41 8°
100 parts of snow, 13 5 parts of potassium nitrate, and 26 parts of ammonium chloride	-17 8°	0°
100 parts of snow, 52 parts of ammonium nitrate, and 55 parts of sodium nitrate	-25 8°	-14 4°
100 parts of snow, 9 parts of potassium nitrate, and 67 parts of ammonium sulphocyanate	-28 2°	-18 8°
100 parts of snow, 13 parts of ammonium chloride, and 37 5 parts of sodium nitrate	-30 7°	-23 3°
100 parts of snow, 32 parts of ammonium nitrate, and 59 parts of ammonium sulphocyanate	-30 6°	-23 1°
100 parts of snow, 2 parts of potassium nitrate, and 112 parts of potassium sulphocyanate	-34 1°	-29 4°
100 parts of snow, 39 5 parts of ammonium sulphocyanate, and 54 5 parts of sodium nitrate	-37 4°	-35 3°
100 parts of water, 26 parts of ammonium chloride, and 14 parts of potassium nitrate	-17 8°	0°
100 parts of water, 18 parts of ammonium chloride, and 43 parts of sodium nitrate	-22 4°	- 8 3°
100 parts of water, 55 parts of sodium nitrate, and 52 parts of ammonium nitrate	-25 8°	-14 4°
100 parts of water, 57 parts of sodium nitrate, and 57 parts of ammonium sulphocyanate	-29 8°	-21 6°
100 parts of water, 9 parts of potassium nitrate, and 67 parts of ammonium sulphocyanate	-28 2°	-18 8°
100 parts of water, 52 parts of ammonium nitrate, and 59 parts of ammonium sulphocyanate	-30 6°	-23 1°
100 parts of water, 5 parts of ammonium nitrate, and 113 parts of potassium sulphocyanate	-32 4°	-26 3°
Solidified carbon dioxide and ordinary ether	-100 0°	-148°

not whether the offender might have acted differently, but whether by issuing and attempting to enforce demands he can be made to conform to these demands. Where he can, blame and punishment economically administered are justified by the event, where he cannot, blame and punishment are futile. Thus, responsibility does not disappear in a deterministic theory and in its practical carrying out, it merely submits to a different rationalization. The ethical attitude towards the problem of free will thus is determined by the comparative satisfactoriness of the two hypotheses we have been considering. As a matter of fact, up to the present, there is a disagreement as to this comparative satisfactoriness. At the beginning of our century it seemed as if the determinists had all but won their battle in philosophical circles, to-day libertarianism is advocated by some very prominent thinkers. For a metaphysical as distinguished from an ethical argument for libertarianism, see BERGSON. For various aspects of the subject, see DETERMINISM, ETHICS, FATALISM, PREDESTINATION, WILL.

Consult Edwards, *Freedom of the Will* (London, 1754), Spencer, *Psychology* (New York,

depends upon the following facts (1) melting, or the passage of a substance from the solid state to the liquid, involves the conversion of *sensible heat* into "latent heat," and if no heat is added to a melting substance from without, part of the sensible heat of the substance itself disappears, and therefore the temperature falls, (2) the solution of many salts in water causes the absorption of heat, and hence, again, if there is little or no addition of heat from the surroundings, there is caused a fall of temperature. The efficiency of the first of these causes may be seen from the following. If a piece of ice having the temperature of 0° C (32° F) is placed in its own weight of water at 79° C (174 2° F), it is found that, after the ice has melted, the temperature of the liquid is reduced to 0° C (32° F), much of the sensible heat which the water contained having thus disappeared during the melting of the ice. The lowering of temperature by solution is illustrated in a striking manner by the fact that ammonium sulphocyanate, if thrown into its own weight of nearly boiling water, will reduce the temperature to the point of freezing, if thrown into its own weight of water of ordinary

temperature, the same salt will reduce the temperature to -21°C (-5.8°F). In the mixture of pounded ice and salt used in making ice cream, the lowering of the temperature is due both to the conversion of sensible into latent heat during the melting of the ice and to the absorption of heat during the solution of the salt. The following table shows the more important freezing mixtures and the temperatures that may be obtained by the use of them. Supposing that there is no absorption of heat from the surroundings, the fall of temperature produced by mixing a given set of substances is determined by the amount of sensible heat absorbed (i.e., the heat of fusion and solution) and by the specific heats of the substances between the initial and final temperatures. The temperatures obtained depend, of course, upon the initial temperatures of the mixtures. The initial temperature of any mixture given in the following table, unless otherwise specified, is assumed to be the freezing point of pure water.

Substances employed as freezing mixtures, if solid, should be finely powdered, rapidly mixed, and placed in vessels that have but little conducting power. These freezing mixtures are only available for use on a small scale. A fact extensively utilized for the production of low temperatures on a large scale is that, like the liquefaction of solids, the evaporation of liquids, too, involves the absorption of considerable amounts of sensible heat. See EVAPORATION, REFRIGERATION, and especially FREEZING POINT. For an extensive list of freezing mixtures, consult Landolt-Börnstein, *Physikalisch-chemische Tabellen*, pp 318-323 (Berlin, 1912).

FREEZING POINT The temperature at which a single pure substance can exist partly in the solid, partly in the liquid, state. If, while the substance is partly solid and partly liquid, heat is added to it, some of the solid portion melts, the added sensible heat changes into "latent heat of fusion" (see FREEZING MIXTURES), and, as long as the solid portion lasts, the temperature remains constant. Again, the abstraction of heat can only be effected at the expense of the latent heat of the liquid portion, which is thereby gradually solidified, and hence, as long as the liquid portion lasts, the temperature remains constant. If heat is neither added nor abstracted, the solid and the liquid portion remain in equilibrium, i.e., neither does the solid melt nor the liquid solidify. Now, as long as this equilibrium exists, the vapor tensions of the solid and liquid portions must be precisely equal. If the vapor tension, say, of the liquid were greater than that of the solid, a process of distillation would take place, and the amount of solid would grow at the expense of that of the liquid, but, by definition and by common experience, if no heat is gained or lost, the relative amounts of solid and liquid remain, at the freezing point, unchanged. The freezing point of a given substance may therefore be defined as the temperature at which the substance has the same vapor tension in the solid and in the liquid state. That temperature may be referred to either as the freezing point of the liquid or as the melting point of the solid. Thus, the freezing point of water is the same as the melting point of ice. This is, however, true only in the case of a single pure substance. In the case of solutions and all other sorts of mixtures the temperature at which freezing commences is by no means the same as the temperature at which

the mixture, if entirely solidified, would begin to melt, the latter temperature is practically always lower, and can never be higher, than that at which solidification of the completely molten mass would first set in. In other words the freezing point and the melting point of a given mixture of two substances *A* and *B* are by no means the same.

Freezing Point of Solutions. An important fact to be remembered in connection with freezing solutions is that *ordinarily* the pure solvent alone freezes out. It will be seen, further, that the freezing point of a solution is the lower the greater the amount of substance dissolved. While, therefore, the solvent alone is freezing out, the temperature must obviously fall. Hence, if we wish to speak of the freezing point of a solution of given strength, we must refer to the temperature at which freezing just commences, for freezing changes the composition. Experience shows, however, that unless the given solution is very concentrated, and unless the amount experimented upon is very small, a moderate quantity of the solvent may be allowed to freeze out, without the result of the observation being thereby considerably impaired. In other words, under proper experimental conditions, the difficult determination of the point at which freezing just commences is unnecessary. The freezing point of solutions is generally determined by the use of Beckmann's apparatus shown in

the accompanying figure. The outer jar, *C*, contains some liquid whose temperature is kept constant and a few degrees below the freezing point of the given solution, a glass stirrer serving to keep the temperature uniform throughout the volume. The wide tube, *B*, contains nothing but air and serves to prevent the too rapid cooling of *A*. In making an observation, a known amount (say, 20 grams) of the pure solvent is introduced into the strong inner test tube, *A*, through the side tube, and when freezing has set in and the thermometer shows a constant temperature, the latter is carefully noted. In this manner the freezing point of the pure solvent becomes exactly known. Next, a known amount of the substance to be dissolved is introduced to the solvent in *A*, again through the side tube, the contents of *A* are caused to melt by removing *A* from *B*, and when all is dissolved *A* is replaced in *B*, again, when freezing has set in and the thermometer shows a constant temperature, the latter is carefully noted. In this manner the freezing point of the solution too becomes exactly known, and then the *difference* between the freezing point of the pure solvent and the solution is found by a simple subtraction. The thermometer used in such determinations is of the Beckmann type, such a thermometer is usually graduated in one-hundredths of a de-

BECKMANN'S APPARATUS

gree and permits of reading differences within one-thousandth of a degree—a precision by no means too great for the purpose involved. A great many determinations of this nature, carried out with a great variety of substances, led the Frenchman Raoult to the establishment of the following law. *The freezing point of a solution is lower than that of the pure solvent, the difference being, for the same substance, proportional to the amount, and, for different substances, not only proportional to the amounts, but also inversely proportional to the molecular weights of the substances dissolved.* A comparison of this law with the one that holds good for the elevation of the boiling point (see BOILING POINT) will show the perfect analogy between the two laws. Here, too, as in the case of the boiling point, the simple law holds good only for substances whose solutions do not conduct electricity, matters being much more complicated in the case of solutions of electrolytes. (See DISSOCIATION.) Raoult's law permits of determining the unknown molecular weights of newly discovered substances. The art of precisely measuring freezing-point depressions for this purpose is called *cryoscopy*. The observer determines the freezing points of the pure solvent and of two equally strong solutions in the same solvent—one containing the new substance, the other some substance of known molecular weight—and then the molecular weight of the given substance is found simply by the rules of proportion. More usually, the molecular weight of a substance is calculated by Raoult's formula $M = E \frac{100}{t}$, in which M is the desired molecular weight, t is the freezing-point depression produced by dissolving m grams of the substance in 100 grams of the solvent, and E is the so-called molecular depression of the freezing point. This quantity E varies from solvent to solvent. Van't Hoff has shown that for a given solvent E may be calculated by the following theoretical formula

$$E = \frac{0.02T^2}{r},$$

where T is the freezing point of the pure solvent (in absolute degrees) and r is the latent heat of fusion of 1 gram of the pure solvent. The solvents most frequently employed for such determinations are glacial acetic acid, water, and benzene. Still, other solvents too can be and are frequently employed. The molecular depressions E for the three solvents just mentioned are

Solvent	E
Acetic acid	38.5
Water	18.6
Benzene	52

See MELTING POINT, SOLUTION, MOLECULES—MOLECULAR WEIGHTS

Nernst and Abegg's Theory of the Freezing Point The determination of the freezing point, as explained above, seemed to be a perfectly reliable operation until experience had shown that considerably different results are obtained by using apparatus different in size and shape, by having different temperatures in the outer jar (C), and by varying the rate of stirring in the inner tube (A). In 1894 Nernst and Abegg gave a mathematical explanation of this important phenomenon—important because of its connection with the theory of solutions and with the determination of molecular weights.

The principle of these calculations is as follows. The temperature in the outer jar (C) is, as we have seen, kept a few degrees below the freezing point of the given solution. If the latter did not freeze and were not stirred, heat would flow from it into the outer vessel until the temperature in A and in C would be the same. This flow of heat would take place, for a given form of apparatus, at a rate proportional at any instant to the difference of temperature at that instant between A and C . On the other hand, regular stirring would cause the formation of sensible heat in A at a constant rate. When the steadily diminishing rate of the outflow of heat from A to C becomes equal to this constant rate of production of heat in A , the temperature in A must evidently become constant. This constant temperature Nernst and Abegg term the "convergence point." All this, however, presupposes that the liquid in A does not freeze. Suppose, now, that as soon as the solution has reached the convergence point, freezing has set in, and suppose that in a given case the convergence point is lower than the freezing point. During freezing the latent heat of fusion is evolved as sensible heat, and the temperature rises, tending to approach the true freezing point of the solution. There is experimental evidence to the effect that the rate at which the temperature thus rises is, at any instant, proportional to the distance of the temperature at that instant from the true freezing point. In other words, the nearer to the true freezing point, the slower the freezing, and hence the slower the variation of the temperature caused by it. But "the nearer to the true freezing point" means "the farther from the convergence point", and we have seen that the farther from the convergence point, the more rapid the rate of variation in the direction of that point. There must therefore exist, somewhere between the true freezing point and the convergence point, a point at which the rates of variation upward towards the true freezing point, and downward towards the convergence point, are precisely equal. That point Nernst and Abegg term the "apparent freezing point." And they justly maintain that, everything being taken into account, the temperature usually observed, after variation has ceased, is not the *true* freezing point, which is, of course, dependent on nothing but the nature and strength of the given solution, but the *apparent* freezing point, which may obviously depend on the temperature of the outer jar, on the amount of solution experimented upon, on the rate of stirring, on the specific rate of freezing or melting of the solvent, etc. The effect of stirring is so considerable that in several cases the convergence point has been found to lie, not below, but above the true freezing point, in spite of the somewhat low temperature in the outer jar. In such cases, too, the apparent freezing point is, of course, somewhere between the true freezing point and the convergence point. The difference between the true and apparent freezing points is, as might be readily supposed, not very great. In fact, in many cases (e.g., in the case of common salt) it may be safely neglected. In other cases, however (e.g., in the case of weak solutions of cane sugar), it must be taken into account if results at all reliable are to be obtained. The exact way of applying the theory in practice, with a view to ascertaining the true freezing point of solutions, may be found described

the original memoir, by Nernst and Abegg, in vol xv of the *Zeitschrift für physikalische Chemie* (1894), and even better in a monograph by Raoult, *Cryoscopie de Précision* (Grenoble, 1899). It scarcely needs to be added that at the apparent freezing point there is really no equilibrium between solid and liquid, that either melting of the solid portion or freezing of the liquid portion is continually going on, according as the apparent freezing point is above or below the true freezing point of the solution.

Cryohydrates. We have seen above that generally the pure solvent alone freezes out of solutions, and that the freezing out of much of the solvent would cause a corresponding depression of the freezing point. In other words, if freezing were allowed to go on to a large extent, the given solution would become more and more concentrated and the temperature would fall lower and lower. Finally the solution would become saturated. Further freezing would then naturally cause the precipitation of the substance dissolved, the concentration of the solution would remain constant, and hence the freezing temperature, too, would remain constant. At one time solutions thus having a constant freezing point were taken to be chemical compounds of the dissolved substances with the solvent and were therefore named "cryohydrates." It is now clear, however, that there is no more reason for such an assumption than there is for assuming that, in general, any saturated solution is a true chemical compound. The substance freezing out of a saturated solution is nothing but a mechanical conglomerate of the frozen solvent and the substance originally dissolved, and, of course, the melting temperature of this mixture, being identical with the freezing temperature of the saturated solution, is likewise constant. It is also clear that the melting point of the cryohydrate is the lowest temperature at which a solution of a given substance in a given solvent can exist. Hence, by mixing ice with salts in the proportion in which they would form cryohydrates, we can obtain freezing mixtures having the lowest constant temperature that can possibly be attained with the given salts. Cryohydrates are now classed with the so-called "eutectic mixtures." See MELTING POINT.

Cryohydrates are at times extremely useful in that they permit of establishing and maintaining perfectly constant temperatures below the freezing point of water. Following is a list of constant temperatures that may be obtained with the aid of a number of ordinary salts (hydrated) and finely divided ice.

	Constant temperature (°C)
Hydrated salt	
Acid sodium phosphate	-1
Sodium sulphate	-1.2
Copper sulphate	-1.6
Sodium carbonate	-2.1
Magnesium sulphate	-5.0
Zinc sulphate	-6.55
Calcium nitrate	-16
Sodium chloride	-21.3
Sodium bromide	-28
Potassium carbonate	-36.5
Calcium chloride	-55
Zinc chloride	-62

FREEZING PROCESS FOR FOUNDATIONS. See FOUNDATION.

FREE ZONE. See ZONA LIBRE.

FREGENAL DE LA SIERRA, frā'nā-nāl'/dā lā sé-ār'rá. A town in the Province of Bada-

joz, Spain, 50 miles south by east of the city of Badajoz (Map Spain, B 3). It is situated in a fertile and picturesque valley north of the Sierra Morena Mountains and is laid out with regular and spacious streets. There are plazas and fine buildings. The ancient castle, which was erected by the Templars to whom the town was granted in 1283, has been converted into a bull ring. The town has a considerable trade in cattle and manufactures cloth, baize, hats, leather, and flour. Pop, 1900, 9582, 1910, 10,415.

FREHER, frā'ēr, MARQUARD (1565-1614). A German historian, born at Augsburg. He studied law at Altdorf and Bourges, was professor of Roman law at Heidelberg (1596-1614), and was frequently sent as Ambassador to Poland and other countries by the Elector Frederick IV. He published several important historical works in Latin, among which the work *Origines Palatinae*, with its interesting information on Heidelberg and other early German settlements, is among the most important. It was first printed in 1599 and has since been frequently republished. Consult *Ersch und Gruber*, vol. xlviii, pp. 416-417.

FREIBERG, frī'bērk. An old and important town of Saxony, the centre and seat of the mining district and mining administration of Saxony, on the north slope of the Erzgebirge, 1325 feet above sea level and 25 miles southwest of Dresden (Map Germany, E 3). Freiberg retains portions of its fortifications and many old buildings. The southern portal of the late Gothic cathedral (1490-1512), known as the "Golden Door," is a relic from the ancient Romanesque church built on the same site, but burned down in 1484. The sculptures on this door are considered among the finest of the plastic ornamentations of the Middle Ages. The church contains the burial vault of 41 Protestant Saxon princes descended from Henry the Good, and a large organ built by Silbermann. Also worthy of note are the old castle of Freudenstein, constructed in 1577, now used as an arsenal, the late Gothic Rathaus dating from the beginning of the fifteenth century, and the sixteenth-century Kaufhaus, with its museum of antiquities, a library with 10,000 volumes, and the King Albert Museum. Among the educational institutions are a sixteenth-century gymnasium and the famous mining academy, founded in 1765 and attended by students (422 in 1913) from all parts of the world. The school possesses extensive geological and mineralogical collections, chemical and assay laboratories, a library of 50,000 volumes, and the Werner Museum. Other institutions are a trade school, an agricultural school, a gymnasium, and a state experiment station for the leather industry.

Freiberg has large smelting works and foundries. The largest mines were acquired by the state in 1886, but all but a small part for the use of the mining academy was abandoned as a state enterprise in 1913. There are now about 30, though formerly the number ran as high as 60. They produce chiefly silver and lead. They are annually visited by many mining experts and tourists. There are manufactures of gold and silver wire, machinery, leather, woolens, fertilizers, cigars, powder, chemicals, pianos, scientific instruments, baskets, and linen. The city is lighted by gas and electricity and has an electric street railway. Pop, 1890, 28,-

955, 1900, 30,175, 1910, 36,237 The city owes its origin to the discovery of silver in the vicinity in the twelfth century. It was strongly fortified and obtained municipal privileges about the beginning of the thirteenth century. After being subject to various rulers it fell to the Saxon Albertine line in 1485. Consult Gerlach, *Kleine Chronik von Freiberg* (Freiberg, 1898), *Freibergs Berg und Huttenwesen, herausgegeben durch den Bergmannschen Verein zu Freiberg* (ib, 1893), Ledebur, *Ueber die Bedeutung der Freiburger Bergakademie* (ib, 1903), H. Müller, *Die königliche sächsische Bergakademie zu Freiberg* (ib, 1904).

FREIBERG, HEINRICH VON See HEINRICH VON FREIBERG

FREIBURG, frī'bōrk The attractive capital of a district of the same name in the Grand Duchy of Baden, Germany, and the former capital of Breisgau (q v), situated in the charming valley of the Dreisam, about 11 miles east of the Rhine and 72 miles south-southwest of Karlsruhe (Map Germany, B 5). The environs are exceptionally beautiful, embracing a rich plain, lovely vine-clad hills, and a portion of the picturesque Black Forest. In appearance Freiburg very agreeably combines features of an ancient and a modern city. It contains numerous specimens of mediæval architecture, and there remain portions of the old fortifications, though these have been chiefly replaced by public walks and vineyards. The cathedral, a rival of the Strassburg Minster and restored since 1880, is one of the most perfect specimens of Gothic architecture in Germany. It is of red sandstone, the Romanesque transept and the side towers dating probably from the twelfth century. The choir was not completed before the beginning of the sixteenth century. The famous tower, considered the finest of its kind in Europe, with chimes and a curious clock, is 386 feet high and has a square base, an octagonal bell tower, and a pyramidal spire of open stonework. The main portal is richly decorated with allegorical figures, and the beautiful interior contains numerous excellent examples of stained glass belonging to different periods, creditable monuments, and a number of masterly altarpieces by Hans Baldung and Holbein the Younger. Other interesting ecclesiastical edifices are the Roman Catholic church of St. Martin, dating from the thirteenth century, with a modern tower, and the Protestant Ludwigskirche, constructed in Romanesque style in 1829-39.

The noteworthy secular buildings of Freiburg include the sixteenth-century Rathaus, adorned with frescoes, the Kaufhaus, or Merchants' Hall, with a vaulted portico and statues of German rulers on the outer walls, the Kornhalle, with a fine concert hall, the old university, a sixteenth-century Renaissance structure, now annexed to the Rathaus, the new university, formerly a convent, the municipal theatre, and the grand ducal palace. Freiburg is not only well provided with handsome promenades, but is rich in monuments and memorial fountains, the most prominent of the former being the monument erected to the Fourteenth German Army Corps in 1876, and the monument to Berthold Schwarz, the alleged inventor of gunpowder. The celebrated University of Freiburg, founded by the Archduke Albert VI of Austria in 1457, has four faculties, about 150 professors and teachers, and an attendance of about 2500 students in 1912. There are attached to it a library

of 270,000 volumes and 600 manuscripts, and a number of collections and institutes. Besides the university, there are two gymnasia and two *Realschulen*, several special schools, museums, a theatre, and numerous scientific and art associations.

Freiburg has electric lights, an electric street railway, fine water supply, a sewage farm, and several hospitals and charity houses. The city is well known for its manufactures of silk thread, glass, artificial pearls, buttons, paper, furniture, scientific and musical instruments, machinery, chocolate and sugar products, wine, tobacco, cigars, etc. The city is the chief export point for the Black Forest district. It has been the seat of an aischbishop since 1827. Among the attractions on the outskirts is the Schlossberg, with an ancient ruined fortress and pleasure grounds. Pop., 1900, 61,506, 1910, 83,324.

The foundation of Freiburg about the year 1090 is attributed to Count Berthold III of Zähringen. It became a free town in 1120 and attained considerable prosperity. With the death of the last member of the house of Zähringen, Freiburg passed in 1219 to the counts of Urach, whose interference with the rights of the burghers was followed by popular uprisings. The city finally bought its independence in 1366 for 20,000 silver marks and passed under the protection of the house of Hapsburg (1368). During the Thirty Years' War it was taken repeatedly by the Swedes. In 1644 a bloody engagement took place here between the French and the German Catholics. It belonged to the French from 1677 to 1697. Freiburg came into the possession of Baden in 1806. In 1848 it was the scene of a conflict between the insurgents and the troops of the German Confederation. In the following year the revolutionary government was expelled from the town by the Prussians, who remained there until 1851. Consult Rietschel, *Die älteren Stadtrechte von Freiburg im Breisgau* (Vierteljahrschrift, Berlin, 1905).

FREIBURG (Swiss city and canton) See FRIBOURG

FREIDANK, frī'dank (MHG *Vridano*) The name assigned to the author of a German thirteenth-century didactic work entitled *Bescheidenheit*. He was probably a native of Swabia and accompanied the crusading army of Frederick II to the Holy Land, where he composed a portion of his poem, about 1228-29. It is a sort of anthology of adages and moral reflections containing much worldly wisdom and was very popular throughout the Middle Ages and well into the sixteenth century. Many manuscripts still exist of the original, which was translated into modern German by Simrock (1867), Baumeister (1875), and Pannier (1878).

FREIGHT (ME *freyt*, *fraught*, Dutch *vracht*, OHG *frēht*, from Goth *fra*, before + *ahts*, property, probably influenced by Fr *fret*, freight, from the same source). The hire of a ship, or part of a ship, for the transport of merchandise, also the merchandise so transported. The agreement for the service is termed a charter party (q v). If a merchant freight a whole ship, but neglect to fill it, the captain is not at liberty to complete the cargo from other sources, without accounting to the merchant for any moneys received for such additional load. On the other hand, if the merchant covenant to freight a certain portion of a ship, he is bound to pay the sum agreed on for that portion, notwithstanding that his goods may fail to occupy

so much space. If in the charter party a day be appointed for sailing, and either the merchant fail to have his goods ready for embarkation by the time fixed, or the vessel be unprepared to start—wind and weather permitting—the agreement may be declared void by the aggrieved party, who can also recover at law for any detriment caused to his property in consequence of the delay. The use of charter parties has been traced back as far as the reign of Henry III. This contract, which in England, and generally in the commercial language of the United States, is called freight, is more commonly spoken of by the legal writers of Scotland as *affreightment* (qv), from the French *affrètement* (Bell, *Com*, i, p. 414), but there is no essential difference in the laws of the two countries with regard to it. Throughout the whole commercial world, indeed, in so far as its provisions are not made the subjects of positive stipulation either by charter party or *bill of lading* (qv), they will be held to be in accordance with the usage of trade, and of that particular branch of trade to which the hiring has reference. The contract for freight is generally considered to be an "entire" contract and not capable of part performance. It contemplates the completion of the voyage and the safe arrival of the cargo at its destination. Usually, therefore, no freight is earned in the event of a loss at sea, nor in case of a delivery at any other port than the one specified in the charter party.

It was formerly held that the payment of the wages of the crew was contingent on the earning of freight by the ship, in accordance with the maxim of Lord Stowell, that "freight is the mother of wages." But this rule, which was already subject to many exceptions, has been abrogated in Great Britain by the Merchant Shipping Act (17 and 18 Vict, c. 104), and by statute in the United States, and wages may now be recovered either by seamen or apprentices, even though no freight has been earned by the vessel, but in cases of shipwreck the claim for wages will be barred if it be proved that the man did not exert himself to the utmost to save the ship, cargo, and stores. The provision was first introduced by 7 and 8 Vict, c. 112, § 17, which enacted that, in order to enable him to recover his wages, the seaman should be bound to produce a certificate from the master or chief surviving officer of the ship, to the effect that he had so exerted himself. By § 183 of 17 and 18 Vict, c. 104, the onus of proof is very properly laid on those who impugn the conduct of the seaman. The old rule is still adhered to in America, but it is not applied to the master, and it does not hold with reference to seamen if the freight has been lost by the fault either of the master or owner, e.g., if the ship has been seized for debt or for having contraband goods on board.

The word "freight" is a term formerly applied only to maritime business, such as the hire and use of vessels, but more recently extended to goods transported on land, as on railways where there are regular "freight" cars. The term is used to signify also the money or consideration paid for carrying. With regard to freight by ships, the laws of the United States are practically the same as in England.

While much ocean freight is still carried by specially chartered or other steamers which follow no definite routes but seek cargoes wherever they can be found, the greater part of

oversea-freight carrying is done by lines of freight steamers (usually having accommodation for a few passengers) which run over definite routes and have regular dates of sailing. The sailing ship has become a negligible factor in freight carrying. Consult L. D. Weld, *Private Freight Cars and American Railways* (New York, 1908), E. Watkins, *Shippers and Carriers of Interstate Freight* (Chicago, 1909), J. A. Droege, *Freight Terminals and Trains* (New York, 1912), J. F. Strombeck, *Freight Classification* (Boston, 1912). Consult also the reports of the United States Committee on Interstate Commerce. See CARRIER, COMMON, TRANSPORTATION.

FREILIGRATH, frī'lik-rat, FERDINAND (1810-76). A popular German lyric poet of originality, an admirable translator, and a sturdy liberal agitator, born at Detmold. His father was a teacher. Though apprenticed to a grocer at 15, Freiligrath continued his studies and published verses in local journals before he was 20. The years 1831 to 1836 he spent as banker's clerk in Amsterdam. Then, after publishing translations of Hugo's *Odes*, and *Chants du crépuscule*, and launching a literary journal, *Rheinisches Odeon* (1836-38), he became a book-keeper at Barmen, but continued writing lyrics, of which a volume (1838) won immediate and wide favor. This contained the famous "Lorenz," "Prinz Eugen," and "Der Blumen Rache," among his masterpieces. He afterward gave himself wholly to literature, cooperating in several now unimportant works, and gaining a pension of 300 thalers from the Prussian King. Gradually his associates drew him into political strife. In 1844 he surrendered his pension, and in his *Glaubensbekenntnis* placed his poetic gifts at the service of the democratic agitation that was to culminate in the revolution of 1848. Such poems as "Trotz alledem" (a translation of Burns's "A man's a man for a' that"), "Die Freiheit," "Das Recht," and "Hamlet," made his absence from Germany expedient. He went to Belgium and Switzerland, published in 1846 *Englische Gedichte aus neuerer Zeit*, a volume of fine translations, and *Ca ira*, a collection of political songs, and lived till 1848 in England. At the invitation of Longfellow, whom he knew personally, he meditated going to America, but on the short-lived triumph of liberalism returned to Germany as a democratic leader, was for a time imprisoned, published *Zwischen den Garben* (1849) and *Neue politische und soziale Gedichte* (1850), after which he went once more into exile in England (1851), where he remained till 1868, as representative of a Swiss bank. He made some admirable poetic translations, among which an anthology, the *Rose, Thistle, and Shamrock* (1854), and Longfellow's *Hiawatha* (1857), with Shakespeare's *Cymbeline* and *Winter's Tale*, are worthy of record for their felicity and faithfulness. These kept up his popularity in Germany, where in 1866 a subscription of 60,000 thalers was raised for him, partly as a political manifesto. The general amnesty proclaimed in 1868 brought him back in time to celebrate the triumph of 1870 in the popular "Hurrah, Germania!" and "Die Trompete von Vionville." Freiligrath's works are collected in 8 vols. (Stuttgart, 1870-71), and those up to 1858 in 6 vols. (New York, 1858-59). There is a volume of select translations into English, ed. by his daughter, Mrs. Kroeker (Leipzig, 1871). For his biography, consult Kippenberg, (Leipzig, 1868), Schmidt-Weissenfels (Stuttgart,

1876), Buchner, *Ferdinand Freilgrath, Ein Dichterleben in Briefen* (Lahr, 1881-82), Richter, *Freilgrath als Uebersetzer* (Berlin, 1899), Rodenbeig, *Jugenderinnerungen* (ib., 1899)

FREIMUND RAIMAR, frī'mōont rī'mar A pen name of the German poet Friedrich Rückert (q v)

FREIND, frīnd, JOHN (1675-1728) An English physician He was born at Croton in Northamptonshire, graduated at Christ Church, Oxford, in 1698, entered the medical profession, and in 1705-07 acted as physician to the English army under the Earl of Peterborough in Spain In 1722 he was a member of Parliament, but being suspected of favoring the restoration of the Stuarts, he was imprisoned in the Tower for six months From 1727 until his death he was physician to Queen Caroline He published several works on medical subjects, the most important of which is his *History of Physick from the Time of Galen to the Beginning of the Sixteenth Century, chiefly with regard to Practice* (2 vols, 1725-26) His brother, ROBERT (1667-1751), was a well-known classical scholar

FREIRE, frī'e-rā, RAMÓN (1787-1851) A Chilean soldier and legislator, a grandson of Freire de Andrada, born at Santiago, Chile He served in the War for Independence from 1811 to 1820 and soon thereafter became the leader of the Liberal party, which elected him Supreme Dictator of the government in 1823, his reelection following in 1827 In this capacity he put an end to Spanish domination in Chile in 1826, when he forced the last Spaniards to leave the island of Chiloé Upon the accession of the Conservative party to power he led an army revolt and was banished to Peru He returned in 1842, after an absence of five years, but did not reenter politics There is a bronze statue of him in Santiago

FREIRE DE ANDRADA, dā an-dra'da, GOMES (1685-1763) A Brazilian administrator, born at Coimbra, Portugal From 1733 until shortly before his death he was Governor and Captain General of Rio de Janeiro, and his administration finally extended also to the other provinces of Brazil He contributed greatly to the development of the mining interests of the country and was an active promoter of colonization and public works The war over the boundaries of Brazil and Paraguay was fought during his administration (1754-56) As the greatest colonial Governor of Brazil, his achievements have been celebrated in the epic poem entitled *Epicos Brasileiros* (2d ed, under the title *O Uruguay*, 1811), by José Basilio da Gama

FREISCHUTZ, frī'shuts (Ger free shooter). A legendary marksman who enters into compact with the devil that six balls from his gun shall follow his own will, but the seventh the devil's The idea was general in the fourteenth and fifteenth centuries and especially during the Thirty Years' War It emerged in literature in Apel's *Gespenscherbuch* (1810-15) and as adapted to Weber's opera, *Der Freischütz* (1821, text by F. Kind), is universally known

FREISCHUTZ, DER (Ger. The Poacher) An opera by Weber (q v), first produced in Berlin, June 18, 1821, in the United States, March 3, 1825 (New York)

FREISING, frī'zing A town of Upper Bavaria, situated on the Isar, about 22 miles northeast of Munich (Map Germany, D 4) It is of Roman origin and has a fine restored twelfth-

century Romanesque cathedral, with two towers and a curious quadruple crypt The former episcopal palace is now occupied by a clerical seminary The historian Otto von Freising was Bishop here from 1137 to 1158 Freising has a theological lyceum, a gymnasium, a teachers' seminary, and a preparatory school, and a number of benevolent institutions The chief manufactures are agricultural machinery, pottery, and stained glass Near Freising is the former Benedictine abbey Weißenstephan, now an agricultural bureau, with a training school for brewers and fruit growers The town was the capital of the bishopric of Freising, which was founded in 724 by the Romans and united in 1803 to the bishopric of Munich Pop, 1900, 10,092, 1910, 14,946

FREISING, OTHO OF See OTHO OF FREISING
FREJES, frā'hēs, FRANCISCO (?-1845) A Mexican historian He was born in Guadalajara, was educated for the priesthood, and became a Franciscan monk He became widely known as a pulpit orator, but left the pulpit to pursue his historical studies For this purpose he entered the Convent of Guadalupe in Zacatecas, and he became its superior in 1838 His most valuable work was his *Historia breve de la conquista de los estados independientes del imperio mejicano* (new ed, 1878) He also wrote *Memoria histórica de los sucesos mas notables de la conquista particular de Jalisco por los Españoles* (1842)

FREJUS, frā'zhūs' (Lat *Forum Julii*). A town in the Department of Var, France, situated 15 miles southeast of Draguignan (Map France, S, L 5) It is a bishop's see since the fourth century and is much frequented as a health resort Originally settled from Marseilles, it was afterward colonized anew by Julius Caesar and called Forum Julii Its numerous Roman remains, including walls, a pharos, a circus seating 12,000 spectators, and a viaduct constitute its only importance to-day Augustus made the harbor, which is now silted up, the most important naval station in Gaul Among its long list of native celebrities are Agricola the general, Roscius the actor, Cornelius Gallus the poet, the Abbé Sieyès, etc Pop, 1901, 4156, 1911, 4022

FREKI See GERI AND FREKI

FRELINGHUYSEN, frē'ling-hī'zen, FREDERICK (1753-1804) An American lawyer and soldier, grandson of Theodorus Jacobus Frelinghuysen He was born in Somerset Co, N J, graduated at Princeton in 1770, studied law, and was admitted to the bar in 1774 In 1775 he was elected to the Provincial Congress of New Jersey and at the outbreak of hostilities became a member of the Committee of Public Safety He was elected again in the year following, and in the constitutional convention took an active part in drawing up the new Constitution He was a major in the "Minute Men" organization early in 1776 and recruited and became captain of the Eastern Artillery Company He participated in the battle of Trenton, and it is said to have been a shot from his pistol that mortally wounded Colonel Rahl, the Hessian commander Early in 1777 he was made colonel of New York militia and took part in all the military operations of Washington's army in that year and in the battle of Monmouth, in June, 1778 In 1778-79 and in 1782-83 he was a member of the Continental Congress During the next 10 years he practiced his profession, attaining great eminence, and from 1793 to 1796 he was a

United States Senator In 1794, during the Whisky Insurrection, he served as a major general of the New Jersey militia

FRELINGHUYSEN, FREDERICK THEODORE (1817-85) An American lawyer and political leader, a grandson of Frederick Fielinghuysen He was born in Millstone, N J, graduated at Rutgers College in 1836, studied law in the office of his uncle and adoptive father, Theodore Fielinghuysen, at Newaik, and in 1839, though but 22 years old, succeeded to his large practice He was city attorney of Newark in 1849 and became widely known as a counsel of many important corporations, among them the Central Railroad of New Jersey and the Morris and Essex Canal Company Originally a Whig in politics, he was one of the founders of the Republican party in New Jersey In 1861 he was a delegate from New Jersey to the Peace Congress at Washington, and in the same year became Attorney-General of the State, serving until 1866 He was appointed United States Senator in 1866 to fill the vacancy caused by the death of William Wright, and he served until 1869, achieving a reputation as an able debater In 1870 he was appointed Minister to Germany, but declined the appointment after he had been confirmed by the Senate In 1871 he was elected to the United States Senate After the disputed election of 1876 he was one of the framers of the bill creating the Electoral Commission, and after the commission was constituted, in 1877, served as one of its members After several years spent in the active practice of his profession he again entered political life (in December, 1881), succeeding James G Blaine as Secretary of State in President Arthur's cabinet He was a trustee of Rutgers College and president of the American Bible Society

FRELINGHUYSEN, THEODORE (1787-1862) An American legislator and educator, son of Gen Frederick Frelinghuysen He was born at Millstone, N J, graduated at Princeton in 1804, was admitted to the bar in 1808, raised and commanded a company of volunteers in the War of 1812, and from 1817 to 1829 was Attorney-General of New Jersey In 1828 he was elected to the United States Senate, where he was a prominent debater on the Whig side, taking an especially active part in the discussions over the rechartering of the United States Bank and the withdrawing of the government deposits therefrom, and over the tariff, but, failing of reelection in 1835, he resumed the practice of his profession in Newark, N J, of which city he was mayor in 1837 and 1838 He was chancellor of the University of the City of New York from 1839 to 1850, was the Whig candidate for the vice presidency on the ticket with Henry Clay in 1844, and was president of Rutgers College from 1850 until his death Consult Chambers, *Memoir of Theodore Frelinghuysen* (New York, 1863)

FRELINGHUYSEN, THEODORUS JACOBUS (1691-1747) An American clergyman He was born in West Friesland and, after holding a pastorate there, came to America and settled in New Jersey as a missionary of the Reformed Dutch church (1720) He became widely known as an eloquent preacher, especially during the revival period known as the Great Awakening, and was a delegate to the first convention of the Reformed Dutch church, held in New York Several of his sermons, delivered in Dutch, were published at Utrecht, where they were most

favorably received, others, translated into English by William Demarest, with a biographical sketch, were published in 1856

FREMANTLE The chief seaport of Western Australia, in Swan County, at the mouth of the Swan River, 12 miles southwest of Perth (Map Australia, D 6) Its harbor has been much improved, has a fine modern town hall with a lofty clock tower, a handsome Anglican church, a hospital, an insane asylum, and a literary institute with a public library It manufactures leather, beer, flour, furniture, lumber, soap, iron and steel goods, and ships On an island in the harbor are government salt works The town is divided into three districts—Fremantle, Fremantle East, and Fremantle North Pop, 1901, 14,623, 2489, and 3247, 1911, 14,499, 3856, and 3315, respectively

FREMANTLE, SIR EDMUND ROBERT (1836-) An English naval officer, born in London and educated at Cheam School, Surrey He entered the navy in 1849, served in the Burmese War in 1852, became lieutenant in 1857 and commander in 1861, was in the New Zealand War in 1864-66 and in the Ashanti War of 1873-74, blockaded the east coast of Africa in 1888-89 and commanded the Witu punitive expedition of 1890, became vice admiral in 1890 and (after commanding in China in 1892-95) admiral in 1896 He wrote the Royal United Service Institution prize essay on *Naval Tactics* (1880), sketches of Hawke and Boscawen in *From Howard to Nelson*, and *The Navy as I have Known It* (1905)

FREMANTLE, WILLIAM HENRY (1831-) An English clergyman He was educated at Balliol College, Oxford, was fellow of All Souls from 1854 to 1864, was ordained in 1855, was select preacher at Oxford in 1879-80 and Bampton lecturer in 1883 From 1883 to 1894 he was fellow and tutor in theology at Balliol He was canon of Canterbury from 1882 to 1895, when he was appointed dean of Ripon His works include *The Ecclesiastical Judgments of the Privy Council* (1865, with G C Brodrick), *The Gospel of the Secular life* (1882), *The World as the Subject of Redemption* (1885, Bampton Lectures), *Church Reform* (1887), a version of the principal works of St Jerome (1893), *Christian Ordinances and Social Progress* (1901), *Natural Christianity* (1911)

FRÉMIET, fra'myá', EMMANUEL (1824-1910) A prominent French sculptor He was born in Paris, and studied under his uncle Rude He began his artistic career as lithographer to the Museum of Natural History and for a time was also employed to paint the corpses in the Morgue In 1843 he achieved marked success with his "Gazelle," which was followed by a group of animal studies, of which "The Mother Cat" and "A Hunting Dog" received medals and were bought by the state In 1850 his "Wounded Hound," now in the Luxembourg, made a great sensation From this time he exhibited constantly, and in 1855 Napoleon III commissioned him to model a series of military statuettes, some of which are preserved in the Frémiot Barbedienne collection In 1875 he succeeded Barye as professor of drawing and modeling at the Jardin des Plantes His celebrated "Gonilla Carrying off the Body of a Woman," refused at the Salon of 1859, received the medal of honor (1887). He received the Grand Prix at the Exhibition of 1900 Many

critics consider him superior to Barye in his animal studies, and his originality, his knowledge of anatomy, and the power and realism of all his work are unquestioned. Other statues and groups are the graceful "Faun," in the Luxembourg, the well-known equestrian statue of Jeanne d'Arc, in the Place des Pyramides, Paris—a bold and spirited production, admirable in movement. Other versions are at Nancy and in Fairmount Park, Philadelphia. Among other noteworthy works are "The Man of the Stone Age", equestrian statues of Napoleon I at Grenoble, the Duke of Orléans at Pierrefonds, the Prince of Condé, the colossal elephant of the Trocadéro Fountain, Paris, "A Mounted Torch-Bearer of the Fifteenth Century", and the statues of De Lesseps at Suez (1899, Chantilly Museum), Du Guesclin at Dinan—one of his finest works, Colonel Howard in Baltimore, Md., and Velazquez, Jardin de l'Infante, Louvre, "St Michael" for the spire of Mont St Michael, and "Meissonier" at Poissy. His extensive exhibit at the St Louis Exhibition (1904) included bronze statues of St George, a "Gorilla of Gabun," and "Race Horses." Frémont was a grand officer of the Legion of Honor and a member of the Institute. Consult his biography by De Biez (Paris, 1910).

FREMONT A city and the county seat of Dodge Co., Neb., 37 miles northwest of Omaha, on the Union Pacific, the Chicago and North-Western, and the Chicago, Burlington, and Quincy railroads (Map Nebraska, H 3). It has important darning and live-stock interests, machine shops, flouring mills, planing mills, breweries, mattress and incubator factories, etc. The city is the seat of the Fremont normal school, and contains a Carnegie library, orphans home (Lutheran), and fine courthouse and high-school buildings. Settled in 1857, Fremont was incorporated in 1871 and is governed under a revised charter of 1901, which provides for a mayor, chosen every two years, and a city council, two of whose members are elected from each ward. The city owns and operates its water works and electric-light plant. Pop., 1900, 7241, 1910, 8718, 1914 (U S est.), 9345.

FREMONT A city and the county seat of Sandusky Co., Ohio, 30 miles by rail southeast of Toledo, on the Sandusky River, and on the Lake Shore and Michigan Southern, the Lake Erie and Western, the Lake Shore Electric, and the Wheeling and Lake Erie railroads (Map Ohio, D 3). The city is at the head of steam navigation on the river, is the centre of a fertile agricultural region and of productive oil and natural-gas fields, and has manufactures of electrocarbons, engines and boilers, agricultural implements, shears, cutlery, stoves and ranges, flour, paper, underwear, beet sugar, sash, doors, and blinds, etc. Ample water power is furnished by a large dam and power plant at this place. There are several public parks, a State historical building, and the Birchard Public Library, founded and endowed in 1873 by Sardis Birchard, uncle of ex-President Hayes. Spiegel Grove, the home of ex-President Hayes, is still occupied by his heirs. Pop., 1900, 8439, 1910 9939, 1914 (U S est.), 10,392, 1920, 12,468. A trading post, probably temporary, was established here in 1785, and a fort, called Fort Stephenson, was erected early in 1812. A popular rendezvous of the Indian tribes, Fremont was known as Lower Sandusky until 1850, when its present name was adopted in honor of J. C. Frémont. On Aug. 2,

1813, Major George Groghan, with 150 men, was attacked here by General Proctor at the head of 400 English and 300 Indians. The latter were repulsed with the loss of 94 killed and wounded, while of the Americans only one man was killed and seven wounded. Consult Howe, *Historical Collections of Ohio* (3 vols., Columbus, 1889-91).

FRÉMONT, JOHN CHARLES (1813-90). A distinguished American explorer and soldier, son of a Frenchman of the same name and Anne Whiting, a daughter of a distinguished Virginia family, the divorced wife of John Pryor. He was born in Savannah, Ga., Jan. 21, 1813, and was educated in Charleston College, from which he was expelled for insubordination, but which later (1836) conferred upon him the degrees of A. B. and A. M. In 1833 he went for about three years as teacher of mathematics on the South American cruise of the United States sloop of war *Natchez*. On returning he passed the examination for regular professor of mathematics in the navy, but instead of following this he joined a railway survey party. In 1837 he assisted in another railway survey and, that winter, in the survey of the Cherokee lands in parts of Georgia, North Carolina, and Tennessee. This was the beginning of his work as an explorer. He was next appointed to assist J. N. Nicollet (qv) in the survey of what is now Nebraska, Dakota, Minnesota, and Iowa, which occupied the seasons of 1838 and 1839. During the 1838 absence he was made a second lieutenant in the Topographical Corps, U. S. A. While preparing the maps in Washington, in 1841, he met and eloped with Jessie Benton, daughter of Senator Benton, returning to the Benton home after the marriage ceremony, which was performed by a Catholic priest.

Nicollet was expected to conduct a further exploration into the West with Frémont as chief assistant, but, his health failing, the proposed expedition was placed in charge of Frémont. The order issued for him was to proceed to the frontier beyond the Mississippi, but this did not satisfy him, and he had it changed to extend as far as South Pass in the Rocky Mountains. This was all done by the influence of Thomas H. Benton (qv), the real power behind the plan, and it was the first of a series of scientific examinations of what is now the western domain of the United States—the Oregon part then contested by Great Britain, and the California and New Mexican part belonging to Mexico. On the first, or 1842, expedition Frémont had 21 men. The route was practically that of the already established Oregon Trail of the emigrants, from Westport (Kansas City) to and up the North Platte and the Sweetwater through South Pass, where a turn was made to the north and a high mountain (13,790 feet) of the Wind River Range, since known as Frémont Peak, was climbed. The second, or 1843, expedition was projected on his return, to connect the 1842 work with that done on the Pacific coast by Captain Wilkes, U. S. N. On the second expedition he had 39 men. Barely had he reached Westport when an order arrived at St. Louis commanding his return because, without authority, he was taking a twelve-pounder howitzer. His wife, receiving the order in St. Louis, did not forward it, but, instead, sent a swift messenger telling him to get into the wilderness as quickly as possible and ask no questions. By the Smoky Hill Fork, the Cache

à la Poudre, the head of the Medicine Bow, and the Sweetwater he again reached South Pass, thence went to Great Salt Lake via Bear River, and navigated a rubber boat to the island which now bears his name. Thence by Snake River valley and the Columbia he reached Fort Vancouver, where he connected with the Wilkes survey. Instead of coming home by the way he had gone, he swung south into the Territory of Mexico and struggled through the western part of the desert region he named the Great Basin, in search of a mythical river called the Buenaventura, in which there was still a belief, although Jedediah S. Smith and Joseph Walker, who had previously crossed the basin from west to east and east to west, had not found it. Frémont was the first to inspect the region scientifically, and much of the way he traversed original ground. Discovering and naming Pyramid Lake, he proceeded south to what is now Walker River, where he concluded to strike west for Sutter's Fort, and accordingly crossed the Sierra Nevada, by Carson Pass, in January and February, 1844, reaching Sutter's on March 5.

From this place he continued south up the San Joaquin valley, recrossed the Sierra by Tehachapi Pass, went to the Mohave River, then to the Virgin via Las Vegas, Nevada, and up that stream to the west foot of the Wasatch, which he followed to Utah Lake. Thence he struck east, via Uinta River and Brown's Park, to the North Platte and turned south through the Parks of Colorado to the Arkansas, which he followed eastward, arriving in St. Louis, Aug. 6, 1844, and a few weeks later in Washington. His report created a sensation, and Congress ordered 10,000 copies printed for distribution. Numerous publishers reprinted it in their own editions, one reaching a sale of more than 20,000 copies. He was appointed captain by brevet, July 31, 1844.

The Mexican War was now imminent and Frémont's third, or 1845, expedition, speedily organized, has a vital bearing on the acquisition of California. From Bent's Fort on the Arkansas, which was left Aug. 16, 1845, Frémont had a force of 60 well-equipped marksmen, to whom prizes were offered for every increase of skill. They proceeded by the Arkansas, the Grand, and the Uinta to the Wasatch Mountains, and across them to Utah and Salt Lakes. Thence they went down the Humboldt, which Frémont named at this time, to the Sierra Nevada, where they crossed by what is now Donner Pass, descending to Sutter's Fort. Frémont asked permission of the Mexican officials at Monterey to continue his explorations in their country. At first this was granted, then rescinded, and he was commanded to depart. Instead of doing so he fortified himself, March 5, 1846, on a small mountain about 30 miles from Monterey, called Gavilan (Hawk's) Peak. This was in reality the first step in the Mexican War in California. He presently changed his mind about resisting and retreated towards Oregon. Near Klamath Lake, May 9, 1846, he was overtaken by Lieutenant Gillespie, U. S. N., a special messenger from Washington, who had come incognito through Mexico with secret instructions for the American Consul and also for Frémont, but over the exact nature of the latter there has been much controversy. Frémont returned immediately to the lower Sacramento valley.

The American settlers of this locality were

in a state of excitement over threats of expulsion by Mexican officials, and they finally openly revolted by seizing some government horses. Next, the town of Sonoma was captured, and a white flag, with one red stripe at the bottom and a large star and bear for emblems, was raised over the town proclaiming the "Republic of California," these words being inscribed on the flag. From this the affair received the name of "The Bear Flag Revolt." It was the second step towards the acquisition of California. Captain Frémont, U. S. A., now took command, thus creating an American military occupation and rendering it impossible for any other nation peacefully to make such a move, if, as was claimed, there was this intention. Rumors of the expected beginning of hostilities with Mexico on the Rio Grande came, and finally definite news, but Commodore Sloat in command of the United States fleet was slow to act. At last he raised the flag at Monterey, and soon after Commodore Stockton assumed chief command and actively cooperated with Frémont and Gillespie, the latter having remained as aid to Frémont. The flag of the United States was raised at San Francisco, Sonoma, and Sutter's Fort. Stockton appointed Frémont major of the land forces, which Stockton considered in the nature of maines.

When Los Angeles was taken, Gillespie was put in command of the town, but his methods caused a revolt, and the war broke out afresh just as General Kearny, U. S. A., arrived overland from New Mexico. Kearny cooperated with Stockton and Frémont, but the question of superior authority between him and Stockton was a source of friction. Frémont continued to recognize Stockton as his superior officer. Frémont's commission as lieutenant colonel of a rifle corps now arrived from Washington. Los Angeles was again captured, the war was over, and Stockton appointed Colonel Frémont Governor—a position he held 50 days in defiance of General Kearny's contrary orders. For this and other refusals to acknowledge the official supremacy of Kearny over Stockton, Frémont was tried by court-martial in Washington, on charges of mutiny, disobedience, and conduct to the prejudice of good order and military discipline. Kearny himself made only one charge—mutiny. The trial lasted from Nov. 2, 1847, to Jan. 31, 1848. Frémont was judged guilty and sentenced to dismissal from the service. President Polk refused to confirm the mutiny charge, but approved the verdict on the others, immediately remitting the sentence. Frémont resigned, feeling that he had been deeply wronged. The resignation took effect March 15, 1848.

In October, 1848, with a party numbering 33, Frémont started on his fourth expedition, to survey a railway route to the Pacific. They attempted to cross the San Juan Mountains of Colorado, at the head of the Rio Grande, in the middle of winter, as Frémont wished to determine how much of an obstacle the snow would be to railway operation. After passing the crest it was impossible to go on because of storm and snow, and the party retreated to the Rio Grande in the San Luis valley. Eleven of the men died from lack of food and from exposure before Taos was reached. There a fresh start was made, and California was gained by a far southern route, down the Rio Grande and south of the Gila to the 110th meridian at about 31° 6', where a north course through Tucson was followed to

the Gila and then that stream west Frémont arrived in Sacramento in the spring of 1849

In 1847 he had purchased a large land grant known as the "Mariposas," and now, finding gold mines upon it, he began to develop them. The story of this "Mariposa Grant" is a long one, full of complications. Frémont's title was reversed after being confirmed, but was finally definitely confirmed by the United States Supreme Court. Mortgage and litigation ensued, and at last he lost the property altogether. In 1850 he was elected one of the first two senators from California and repaired to Washington, taking his seat in September of that year. The new senators drew for the necessary short term, and it fell to Frémont. He went to California between sessions and did not get back to finish the term. Failing of reelection, his senatorial career ended. About this time he received a gold medal from the King of Prussia, and the Founder's medal from the Royal Geographical Society. While in London in 1852 he was arrested and put in jail for unpaid bills connected with the conduct of the California revolt—bills that should have been paid by Congress. In 1853, still faithful to his "central route to the Pacific," he organized his fifth and last expedition, with 22 persons, 10 of them Delawares. Leaving his fourth route in the San Juan Mountains to his left, he passed over into Grand River valley (following Gunnison and Heap as far as Green River), crossed the Green at the San Rafael, touched the head of Frémont River, and went through Grass valley and Fremont Pass to the pioneer settlement of Parowan, where the party arrived in an exhausted state, one man, Oliver Fuller, dying the last day before reaching the settlement. From Parowan he continued almost due west across the desert Great Basin to the Sierra Nevada and there turned south along its foot to a pass near Walker Pass, where he went over to the San Joaquin valley. Little was accomplished by the fourth and fifth expeditions, which were financed by himself and Senator Benton.

In 1856 the new Republican party nominated Frémont as its first candidate for the presidency. His nomination was due to his availability, to renown gained by his explorations, and to his known opposition to the extension of slavery. On account of this attitude towards slavery, however, the entire South opposed him as well as large numbers of Northern voters who still wished to let slavery alone. He was defeated, receiving 114 electoral votes to 174 cast for Buchanan. Had he been elected, the War of the Rebellion would have come then, or perhaps not at all, for he did not intend to disturb existing conditions of slavery, only to prevent extension of it into the new territory. Abraham Lincoln "took the stump" in his behalf.

Soon after the outbreak of the Civil War Frémont, through the efforts of his then friends, the Blairs, was appointed a major general and placed in command of the Western Department, with headquarters at St Louis, where, Aug 30, 1861, he issued a proclamation "The property, real and personal, of all persons in the State of Missouri who shall take up arms against the United States, or who shall be directly proven to have taken an active part with their enemies in the field, is declared to be confiscated to the public use, and their slaves, if any they have, are hereby declared freemen." He established a

bureau of abolition to carry out the order respecting manumission. He contended that captured slaves of enemies of the Union were automatically freed, as the government could not reenslave them. His action in this respect was considered premature by Lincoln, who was obliged to annul it, which he did September 11. Charges of incompetence and extravagance were made against Frémont, who was full of large plans. Such charges were common at the time, and politics played a large part in the assignment of commands and the making of generals, so that all that is said against Frémont must be accepted with caution. The echoes of the 1856 campaign were also still in the air. Frémont was removed from the Missouri field and a few months later given command of the Mountain Department of Virginia, Tennessee, and Kentucky. The continued direction of operations from Washington was against military cohesion in the field, and nothing went right. The troops were ill armed, ill fed, and ill managed. The divisions were finally consolidated under General Pope, who was Frémont's junior in rank, and Frémont declined to serve under him. Frémont retired from that field and was not appointed to another command. In 1864 he resigned.

May 31, 1864, he was nominated by a small faction of the Republican party for president, but the support was so slender that he soon withdrew. Being still deeply interested in the subject of a Pacific railway, he became involved in railway construction, which the financial disasters of 1873 brought down in ruin upon his head. He was prosecuted by the French government for alleged participation in swindles connected with the projected transcontinental line and was sentenced on default to fine and imprisonment. From 1878 to 1882 he was Governor of Arizona. In 1890, then 77 years old, he was appointed a major general on the retired list by Act of Congress, and July 13 of that year he died in New York of ptomaine poisoning. He was buried in Rockland Cemetery, Piermont, N. Y., on the west side of the Hudson, 500 feet above the river and only a few yards from the brink of the mountain. A monument was erected at his grave in 1906 by the State of New York. His wife and his son Charles are buried beside him.

FREMSTAD, OLIVE (c1870-) An American dramatic soprano, one of the world's greatest interpreters of Wagner's heroines. She was born at Stockholm, Sweden, about the year 1870, but received her early education and musical training in Christiania. When she was 12 years of age her parents removed to America, settling in Minneapolis. Even before leaving Christiania her progress on the piano had been such that she had appeared as an infant prodigy. When 16 she gave piano lessons and sang in choirs. In 1890 she came to New York, where she continued to give instruction on the piano and sang in various choirs. At the same time she had her voice cultivated by E. F. Bristol, for whom she played accompaniments, as well as for other vocal teachers. After she had made her début as a concert singer, in Boston under Zerah and in New York under Seidl, in 1892, she went to Germany and studied for two years with Lilli Lehmann in Berlin. In 1895 she made her operatic début as Azucena in *Traviata* at Cologne. The following year she attracted the attention of Madame Wagner through her excellent work as one of the Rhine maidens at Bayreuth. In 1897-99 she was a member of the Cologne Opera, but she also was heard in Vienna, Amsterdam, and Antwerp. In 1900 she accepted an engagement for three years at the Royal Opera in Munich, during which time she likewise sang two seasons at Covent Garden, London. Her engagement for the Metropolitan Opera House, in 1903, marks a turning point in her career. On November 25 of that year she made her American début as Sieglinde with overwhelming success. Before long she was idolized by the public, and when, in the course of time, she had appeared in all the great Wagnerian rôles (including Kundry), it was generally admitted that her interpretations had never been surpassed. For 11 consecutive seasons, until 1914, she was one of the greatest stars of the Metropolitan company. Both in New York and Paris she created the part of Salome in Strauss's opera. As a lieder singer also she must be ranked with the world's finest artists. For her achievements she was twice decorated by the French government.

FRÉMY, fi'a'mé', EDMOND (1814-94). A French chemist, born in Versailles. He became professor of chemistry at the Ecole Polytechnique, Paris, in 1846. In 1850 he was made professor of chemistry at the Muséum d'Histoire Naturelle. He acted as director of the Muséum from 1879 to 1881. Frémy's researches extended to almost every branch of chemistry. In addition to numerous papers in the *Annales de chimie et de physique*, he published *Traité de chimie générale* (7 vols, 3d ed, 1862-65). The *Encyclopédie Chimique*, a work in 10 volumes, upon which he was engaged for 13 years, was prepared by him in collaboration with several distinguished scientists, and was completed in 1894.

FREMYOT, J. F., BARONESS DE See CHANTAL.

FRENCH, ALICE (1850-) An American novelist, better known as OCTAVE THANET. She was born at Andover, Mass., and began her literary career, about 1878, with studies of a social and economic bent, but soon turned to short stories, in which she achieved much success, especially after her removal to the West. Iowa and Arkansas gave her opportunities for exploiting regions hitherto little attempted in fiction. Noteworthy among her books are *The*

Bishop's Vagabond (1884), *Knitters in the Sun* (1887), *Otto the Knight* (1893), *A Book of True Lovers* (1898), *The Man of the Hour* (1905), *Stories That End Well* (1911), *A Step on the Stair* (1913). Her novel *Expiation* (1890), won, and deserved, high praise. "Octave Thanet" also edited *The Best Letters of Mary Wroth Montagu*.

FRENCH, ANNE WARNER See WARNER.

FRENCH, DANIEL CHESTER (1850-) An eminent American sculptor. He was born at Exeter, N. H., April 20, 1850, and in 1867 his father, a judge in the New Hampshire courts, moved to Concord, Mass. He studied for a year at the Massachusetts Institute of Technology, attended Dr. Rimmer's lectures on anatomy at Boston, and in 1869 worked for a short time in the studio of J. Q. A. Ward. In 1873 he made for the town of Concord the earliest and one of the cleverest of his more important works, the "Minute Man," and upon its completion went to Florence, where he spent a year with the American sculptor Thomas Ball. In 1876 French opened a studio in Washington, from 1878 to 1887 he made Boston and Concord his headquarters, and in the latter year settled in New York. Meanwhile he had made frequent visits to Paris, but although he absorbed whatever appealed to him most, he does not seem to have come directly under the influence of any one French master. His genius is peculiarly American, and combines singular beauty of technique with poetry, grace, and plastic charm. The sculptural compactness of his groups and the play of light and shade are particularly admirable.

French is a sculptor of great versatility, and the catalogue of his works is large. His "John Harvard" (1882), Cambridge, Mass., is in the severe, simple style of the "Minute Man." His busts of Emerson and Alcott are in the firm, close modeling of his earlier years, and are characterized by the lofty intellectual quality which he so often shows in his portraits. The marble statue of Lewis Cass in the rotunda of the capitol (1888) in Washington is more loosely handled than the two former works, but is large and strong. In the Gallaudet Monument in Washington, French first introduces the element of pathos which has become so familiar in his later works. Perhaps the most interesting is his relief, "Death and the Sculptor," for the tomb of the sculptor Martin Milmore in Forest Hills Cemetery, Boston, which received a medal of honor at Paris in 1900. Of the large amount of decorative sculpture which was done by French, or under his direction, at the World's Fair of Chicago in 1893, the most noteworthy were the many groups with animals, done in collaboration with Edward Potter, his former pupil, who later modeled the horses for his equestrian statues. The great gilded statue of the Republic, which French placed in the Court of Honor, is one of the most striking colossal statues of recent times. His other work includes the monument to John Boyle O'Reilly in the Back Bay Fens of Boston (1895), the statues of Starr King in San Francisco (1890) and of Rufus Choate (1898) in Boston, and the two fine statues, "History" and "Herodotus," for the Congressional Library in Washington. With the assistance of Potter he modeled the bronze equestrian statue of General Grant, in Fairmount Park, Philadelphia, (1899); that of General Washington (1900), presented by an association of American women to the French nation, and

now in the Place d'Jéna, Paris, and that of Gen Joseph Hooker, State House Grounds, Boston (1903). Other important works are the Hunt Memorial in Central Park, New York, "Alma Mater" (1903), in front of Columbia University Library, the fine bronze doors of the Boston Public Library, in low relief, completed in 1904, four groups of the "Continents" for the New York customhouse, of which the models were completed in 1906. His more recent works include the impression of the Alice Freeman Palmer Memorial at Wellesley College (1909), a "Mourning Victory" for the Melvin Memorial, Sleepy Hollow Cemetery, Concord, Mass. (1910), the statue of General Oglethorpe, Savannah, Ga. (1910), Marshall Field Memorial, Graceland Cemetery, Chicago (1911), the seated figure of Emerson, Concord Library (1912), a statue of Lincoln for Lincoln, Neb. (1912). A still more recent commission is the memorial of Andrew H. Green for Central Park, New York. He received numerous distinctions, being elected a member of the National Academy of Design, of the American Academy of Arts and Letters, and of the Accademia di San Luca, Rome, and honorary president of the National Sculpture Society. Consult Caffin, *American Masters of Sculpture* (New York, 1903), Taft, *History of American Sculpture* (ib., 1903), Coughlan, in *Magazine of Art* (1901), Caffin, in *International Studio*, vols. xx (1903), lx (1910), and lxvi (1912).

FRENCH, SIR JOHN DENTON PINKSTONE (1852-1925). A British soldier, born at Ripple Vale, Ripple, Kent. He served in the royal navy in 1866-70, entered the army in 1874, served with the Nineteenth Hussars in the Sudan campaign of 1884-85, and commanded that regiment in 1889-93. From 1893 to 1894 he was assistant adjutant general of cavalry on the staff, and from 1895 to 1897 was assistant adjutant general at army headquarters. He was promoted to the command of the Second Cavalry Brigade in 1897, and appointed major general in command of the cavalry division in Natal in 1899. In 1900 he became lieutenant general (local) commanding the cavalry division in South Africa. He directed the operations about Colesberg (Nov. 10, 1899, to Jan. 31, 1900), was in command of the cavalry in the operations terminating in the relief of Kimberley (February, 1900), and of the cavalry division of Lord Roberts's army in the operations leading to the capture of Bloemfontein and Pretoria. He also commanded Lord Roberts's left wing in the various battles east of Pretoria. For his services he was promoted to be lieutenant general and appointed to the command of the First Army Corps at Aldershot. He became general in 1907, was inspector general of home forces in 1907-11, and was made field marshal in 1913. In March, 1914, during the controversy between Asquith's cabinet and the army over the army's service in Ulster, French resigned, but on the outbreak of war later in the year he reentered the army and commanded the English expeditionary force in France. See **WAR IN EUROPE**.

FRENCH, MANSFIELD (1810-76). An American educator, born at Manchester, Vt., and educated at Burlington (Vt.) Seminary and at the Divinity School of Kenyon College, Ohio. He was one of the founders of Marietta College, in 1835. In 1845 he joined the Methodist Episcopal church, and from 1845 to 1848 he was president of the Xenia (Ohio) Female College. He worked for the founding of Wilberforce Uni-

versity, the first college for negroes in America. In 1858 he became editor of a religious paper, *The Beauty of Holiness*. He was an ardent Abolitionist, and at the outbreak of the Civil War made a study of the negro question with a view to preparing for the emancipation of the slaves. In February, 1862, at an immense mass meeting in Cooper Union, New York City, his plans were explained and the National Freedmen's Relief Association was organized. He became its general agent and carried on its work at Port Royal, S. C., where, in spite of opposition from both civil and military authorities, his work among the negroes met with considerable success.

FRENCH, WILLIAM HENRY (1815-81). An American soldier. He was born in Baltimore, Md., graduated at West Point in 1837, was assigned as second lieutenant to the First Artillery, served in the Florida War of 1837-38, and was engaged on frontier duty until 1847. In the Mexican War he served in the Southern campaign. On Sept. 22, 1848, he was promoted to be captain, and between this time and 1861 was stationed successively at Fort Monroe, Fort McHenry, Fort Clark (Tex.), and Fort Duncan (Tex.). In September, 1861, he was promoted brigadier general of volunteers, and, in October, to be a major in the Second Artillery. He served throughout the Peninsular campaign, earning the brevet of lieutenant colonel, participated in the Maryland campaign and earned the brevet of colonel, was promoted to be major general of volunteers in November, 1862, served in the battles of Fredericksburg and Chancellorsville, and subsequently commanded the Third Army Corps in various minor engagements. On May 6, 1864, he was mustered out of the volunteer service, and on March 13, 1865, was brevetted major general in the regular army. He was promoted colonel in July, 1877, was in command of the troops engaged in the suppression of the Baltimore and Ohio Railroad riots, July 18-24, 1877, and on July 1, 1880, was retired from active service.

FRENCH, WILLIAM MERCHANT RICHARDSON (1843-1914). A prominent figure in the development of the Art Institute of Chicago. He was born at Exeter, N. H., and graduated from Harvard College in 1864. His first occupations were landscape gardening and civil engineering, but he was early interested in art, and by 1874 was sought after as a lecturer on art and as a writer for the reviews. In 1878 he went to Chicago to become secretary of the Chicago Academy of Design, which after various changes became the Art Institute of Chicago. With Charles L. Hutchinson he worked—at first for a salary far smaller than he would have earned in other pursuits—to build up the institution to its present great size and prominence, continuing in its service till his death. He was one of the founders of the American Association of Museums.

FRENCH AND INDIAN WAR. The name usually given to the struggle in America between the French and English (1754-60), roughly coincident with the Seven Years' War in Europe. The French, being in possession of Canada and Louisiana, reinforced their establishments on the banks of the St. Lawrence and near the mouth of the Mississippi, and attempted, by the occupation of various points in the interior with a line of military posts and of protected trading posts, to confine the English

to a strip of territory on the Atlantic coast, while they themselves planned to occupy both the land of the Ohio basin and that surrounding the Great Lakes. The territory in dispute, and especially that watered by the Ohio, was claimed by both France and England, the French resting their claims largely upon the alleged effect on the ownership of an entire river basin of a settlement at the river's mouth, and the English insisting that their King's grants of land "from sea to sea" became literally effective and valid when the coast line was permanently occupied. No permanent settlements had been made in the territory thus claimed by both, although a small settlement of Virginians was established on the Monongahela and settlements in Ohio were in contemplation. The Governor of Virginia had organized a provincial force to protect the western frontier, and hostilities began in May, 1754, with an attack made by Washington on a French force under Jumonville. In 1755 an army of regulars, under General Braddock, acting with a detachment of Virginia troops, undertook an expedition for the capture of Fort Duquesne, which the French had built at the junction of the Monongahela and the Allegheny. This force was disastrously defeated July 9, 1755, and the French retained full control of the frontier. Being enabled to operate on an "inner line" of communication, while the English were obliged to conduct a series of isolated and unrelated campaigns, the French maintained their advantage until the summer of 1758, when they inflicted a great defeat upon the British in the battle of Ticonderoga, July 8, their last important success. The fortune of war now turned. Largely as a result of a more energetic policy introduced by the Pitt administration, the English campaigns were prosecuted more vigorously and resulted in the capture of Louisburg (July, 1758), of Fort Frontenac, on Lake Ontario (August, 1758), and of Fort Duquesne (November, 1758). The French line of defense and of communication was thus broken, and this success was made secure in the following summer by the capture of Ticonderoga, Crown Point, and Fort Niagara. Finally, on Sept. 13, 1759, the forces of General Wolfe defeated the army of Montcalm which was defending Quebec, whose surrender followed, and in September, 1760, control was gained of Montreal and the rest of Canada. Peace was not made until the Seven Years' War (qv) on the Continent was concluded, and in the Treaty of Paris, of 1763, France ceded Canada to England, and England received from Spain the Floridas, which she retained until 1783, while Spain received Louisiana from France. Thus France lost her possessions in America. Consult Winsor, *The Mississippi Basin* (Boston, 1895), Parkman, *Montcalm and Wolfe* (ib, 1884), Sargent, *History of an Expedition against Fort Duquesne, 1755*, edited from original manuscripts (Philadelphia, 1856), Doughty and Parmlee, *The Siege of Quebec and the Battle of the Plains of Abraham* (6 vols., Quebec, 1901), Bradley, *Fight with France for North America* (New York, 1902), Thwaites, *France in America* (ib, 1905), Wood, *The Fight for Canada* (Boston, 1906), Willson, *Life and Letters of James Wolfe* (New York, 1910).

FRENCH ART. See GOTHIC ART, BARBIZON, THE PAINTERS OF, IMPRESSIONIST SCHOOL OF PAINTING; PAINTING; LANDSCAPE PAINTING; SCULPTURE.

FRENCH BROAD A river rising in the Blue Ridge Mountains, in Transylvania Co., western North Carolina (Map North Carolina, B 4). It flows northeast into Henderson County, then north to Asheville, then northwest and west to its confluence with the Holston River, about 4 miles west of Knoxville, Tenn., the two streams forming the Tennessee River (qv).

FRENCH CHALK See CRAYON, TALC.

FRENCH CONGO See FRENCH EQUATORIAL AFRICA.

FRENCH CREEK A stream in Jefferson Co., N. Y., emptying into the St. Lawrence. On Nov. 1 and 2, 1813, a small American force, under General Brown, intrenched on its banks near the site of the present Clayton, N. Y., repelled, with the loss of only two men killed and four wounded, an attack of 12 British vessels, which suffered severely in the engagement.

FRENCH EAST INDIA COMPANY See EAST INDIA COMPANY.

FRENCH EQUATORIAL AFRICA, prior to January, 1910, FRENCH CONGO. A French government-general in west central Africa, consisting of the Gabon Colony, the Middle Congo Colony, and the Ubangi-Shari Colony, to which is attached the Military Territory of the Chad (Map Africa, F 4 and 5). The irregularity of the country's outline was increased by the cession (Nov. 4, 1911) to Germany of about 280,000 square kilometers, carrying an estimated population of 1,000,000. By the accession of this territory to the German Kamerun, the latter now divides French Equatorial Africa at two points, reaching the rivers Congo and Ubangi. The government-general extends from the Atlantic between Kamerun, on the north, and the Congo district of Angola and Belgian Congo, on the south, east to the Congo and Kandeke rivers, the Congo River separating it from the Belgian Congo and the Kandeke from the southeastern arm of Kamerun (which embraces the valley of the Sanga), thence it extends northeast and north to the Sahara, Kamerun and the Military Territory of the Niger being on the west and Belgian Congo and the Anglo-Egyptian Sudan (including Darfur) on the east. The northern part of the government-general, i.e., the Military Territory of the Chad, thus includes the native states of Bagirmi, Kanem, and Wadai. North of the confluence of the Ubangi and Congo the latter river forms the boundary with Belgian Congo. The estimated area of French Equatorial Africa, subsequent to the boundary change of 1911, is 1,439,000 square kilometers (555,598 square miles), and the estimated population 9,800,000. The coast is diversified by several bays and many lagoons. The interior is but partly explored. It is mountainous in the south, with elevations reaching 3600 feet, the river valleys are numerous, extensive, and very fertile. The Gabon, Ogowe, and Kwilu are among the important rivers. The fauna includes the buffalo, leopard, rhinoceros, and crocodile, and the home of the chimpanzee and gorilla is found here. The climate is unhealthy for Europeans. The forests are valuable, and rubber is a prominent product. There are mineral resources of gold, iron, and copper. Manioc is raised by the natives, and coffee, vanilla, cacao, etc., are grown by Europeans. The exports are chiefly rubber, ivory, and costly woods. Some of the other exports are coffee,

cacao, palm kernels, palm oil, and piassava. The general commerce increased from 10,496,000 francs for imports and 7,539,000 francs for exports in 1900 to 13,191,000 and 24,631,000 respectively in 1910 and 19,987,000 and 28,035,000 in 1912. In the latter year, imports from France were valued at 8,320,000 francs, and exports to France at 12,855,000. In 1911 there entered 124 vessels, of 282,657 tons.

French Equatorial Africa is administered by a governor-general, who is assisted by a secretary-general and a council of government. There is a general budget, and also separate budgets for the constituent colonies. Each of the three colonies has a lieutenant governor and an administrative council. The capital of Gabon is Libreville (pop., about 1500), of Middle Congo, Brazzaville (5000), on Stanley Pool, opposite the Belgian Congo town of Leopoldville, of Ubangi-Shari, Bangui. The local budget of the government-general for 1911 balanced at 15,263,000 francs, this does not include the French subvention, which for 1914 was estimated at 10,420,500 francs. Public debt, Jan. 1, 1912, 14,784,000 francs. Towns of importance besides those mentioned above are Franceville, For-de-Possel, and the ports Cape Lopez and Loango. The transportation and communication facilities are very meagre. The inhabitants include the Fan, Bakalai, Mpongwe, and several other important and interesting races or tribes.

The coast of French Equatorial Africa was discovered by the Portuguese in 1470. In 1841 the French established a footing on the Gabon River and actively began operations. Libreville was founded in 1849. In 1862 Cape Lopez was acquired and the French were then in possession of the coast for 200 miles. Explorations and military expeditions extended the French rule northeast until, by a series of conventions (1885-87) with European Powers, the limits of French Equatorial Africa were fixed. Up to 1894 continual encroachments were being made by the Congo Free State (now Belgian Congo), Great Britain, and France. A convention held in that year made a compromise boundary. By treaties with Great Britain in 1899, with Spain in 1900, and Germany in 1908, the boundaries which exist to-day were definitely surveyed and determined upon. Consult *Payeur-Didelot, Trente mois au continent mystérieux, Gabon-Congo*, etc. (Paris, 1900), *Lorin, Le Congo français et le régime des concessions* (ib., 1902), *Cuvillier-Fleury, La mise en valeur du Congo français* (ib., 1904), *Terrail, La chronique de l'an 1911 les négociations à propos du Maroc et du Congo* (ib., 1912).

FRENCH ESTABLISHMENTS IN INDIA.

The French colonies of Pondicherry, Chandernagore, Karikal, Mahé, and Yanam (qqv) in India. French India has a total area of 509 square kilometers (197 square miles) and a population, according to the 1911 census, of 282,379. The estimated population in 1913 was 273,000. Imports and exports (general trade) increased from 4,038,000 and 10,722,000 francs respectively in 1900 to 3,777,000 and 37,466,000 in 1910 and 9,032,000 and 37,218,000 in 1912.

FRENCH ESTABLISHMENTS IN OCEANIA.

A French colony composed of widely scattered islands in the South Pacific. The estimated area is 4395 square kilometers (1697 square miles), and the population in 1911 was returned at 31,477, divided as follows: Society Islands, including Tahiti, Iles-sous-le-Vent, etc.,

1650 square kilometers and 21,543 inhabitants: Marquesas Islands, 1274 and 3117, Tuamotu Islands, 860 and 3715, Gambier Islands, 30 and 529, Tubuai Islands, 579 and 2573. The capital is Papeete (about 3600 inhabitants), in Tahiti, the principal island. Total imports and exports were valued at 3,873,000 and 3,507,000 francs respectively in 1890, in 1900, 3,484,000 and 3,549,000, in 1910, 5,569,000 and 6,031,000, in 1912, 7,747,000 and 8,840,000.

FRENCH FURY. THE A name given to the attack made by the Duke of Anjou on Antwerp on Jan. 17, 1583. The attempt was repelled and all of the assaulting force were killed or captured.

FRENCH GOLD. See OROIDE.

FRENCH GUIANA. See GUIANA.

FRENCH GUINEA, gin'è A colony forming part of French West Africa. It is bounded on the northwest by Portuguese Guinea, on the north by the French colonies of Senegal and Upper Senegal and Niger, on the east by Upper Senegal and Niger and the French colony of the Ivory Coast, on the south by Liberia and Sierra Leone, and on the southwest by the Atlantic Ocean (Map Africa, C 3). French Guinea includes the region of Futa Jallon (qv), the circle of Dinguray in the middle of the colony, and in the east the circles of Siguiri, Kurussa, Kankan, Kissidugu, and Beyla. Part of the eastern boundary is formed by the river Sankarani. The estimated area is 239,000 square kilometers (92,278 square miles). The coastal zone reaches inland to a line varying from 25 to 60 miles from the sea, and is succeeded by a series of abrupt terraces, which are believed to mark the ancient seacoast. Some of the rivers which descend from the mountains of Futa Jallon spread out, upon reaching the coastal zone, into numerous branches forming a sort of network of canals. The alluvial soil of the region is particularly fertile and carries a luxuriant vegetation. Sandy plateaus upon a granite substratum stretch eastward to the mountainous region of Futa Jallon, in which are the water partings of the Senegal, Gambia, and Niger rivers. The eastern circles, attached to the colony in 1899, are lower and less rugged. In French Guinea, rubber, palm kernels, and gums are gathered, and the cultivated crops include millet, rice, sesame, manioc, etc. Cattle raising is practiced on a large scale by the Fulah of Futa Jallon. Little is definitely known of the mineral resources. Native manufactures include apparel, rush mats, pottery, dressed leather, weapons, and jewelry. Total imports and exports increased from 12,442,000 and 10,088,000 francs respectively in 1900 to 29,563,000 and 18,306,000 in 1910 and 19,274,000 and 20,058,000 in 1912. The principal export is rubber. French, English, and German steamers regularly visit Konakry, where there is a jetty over 1000 feet long. A railway to connect Konakry with Kankan was opened in January, 1911, as far as Kurussa, on the Niger (588 kilometers, 365 miles). An extension from Kurussa to Kankan (74 kilometers, 46 miles) was to be opened to traffic in 1914.

French Guinea comprises the Commune of Konakry (which includes the Los Islands), 21 administrative circles, and, in the southeast, a military territory. The capital is Konakry, where resides the lieutenant governor, representing the governor-general of French West Africa. The lieutenant governor is assisted by

a secretary-general and by an administrative council composed of six members, three chosen from the government officials and three from prominent inhabitants.

The population of French Guinea as estimated in 1911 was 1,927,000. In 1914 an official publication enumerated the African races, with a total of 1,809,000 persons. The French numbered about 1100, and other Europeans less than 100. The principal towns are Konakry (occupying Tumbo Island and connected by bridge with the mainland), with 7100 inhabitants, Kankan, a commercial centre, with 7200, Boke, 4400, Kurussa, 5900, Forecariah, 4600, Kindia, 2300, Dubreka, 1200. The natives comprise several more or less mixed races, the most numerous of which is the Fulah. The Fulah of French Guinea are descended from pastoral nomads who came to Futa Jallon towards the end of the sixteenth century. They are good herdsmen, but disdain agriculture. They are fervent propagandists of Islam and are socially organized under a head (almamy) exercising spiritual and limited temporal power. The Fulah number about 684,000. The Susu, or Jallonke, are generally supposed to have been driven out of Futa Jallon by the Fulah. They now dwell principally in the region between Futa Jallon and the coast. In intelligence they are much superior to the coastal indigenes. For the most part they are fetishistic, though sometimes classified as Mohammedan, Islam is making rapid progress among them. They number about 315,000. The Malinke occupy the colony from Futa Jallon eastward. Though less intelligent than the Fulah, they show marked aptitude for agriculture and commerce. Though largely Mohammedan, they are still given to fetishistic practices. They number about 567,000. Grouped with the Malinke are the warlike Coniagui (12,900) and the Bassari (11,300), both fetishistic tribes, who dwell in the northwest of the colony near the borders of Senegal and Portuguese Guinea. The Timene, in the southwest, are mainly fetishistic, quarrelsome, and degraded. Allied to the Timene are the Landuman (21,700) and the Baga (23,900), of the northwest coastal region. The Landuman are fetishistic, drunken, and degraded and seem likely to perish. The Baga are mild in disposition, but drunken, an official French report says that their ears are set near the top of the head. The Toma (36,300), allied to the Malinke, dwell along the borders of Liberia and Sierra Leone. They are fetishists, as also are their neighbors, the Kissien (104,500), the latter are timid, of small stature, and agricultural.

The coast of French Guinea was known to Portuguese explorers at an early date. In the first part of the seventeenth century French merchants began trading in parts of the country, and in 1685 the Compagnie de Guinée obtained from Louis XIV exclusive commercial privileges for a large part of the west African coast, and the region was embraced in a general way in the French "pacte colonial." The littoral portion, called Rivières du Sud, was taken possession of outright by France during the period from 1854 to 1869. The French, in 1884-85, obtained a footing in Bure and forced the Alman rulers of Futa Jallon and neighboring districts on the east to a treaty of peace in 1887. A stubborn contest was next undertaken with Samori and his newly founded Kingdom of Wassulu, on the southern head streams of the Niger, northeast of

Liberia. In February, 1891, at Kankan, on the Milo, he was defeated and driven out of Bissandugu, Sanakoro, and Keruane, and his followers, the Sofa, were scattered. In 1899 that part of the Sudan which contained the upper Niger districts was added to the Guinea Colony. The latest addition was the Los Islands in 1904. Consult Aspe-Fleurimont, *La Guinée française* (Paris, 1900), Le Barbier, *Dans la Haute Guinée* (ib, 1904), Arcin, *La Guinée française* (ib, 1906).

FRENCH HORN. A name assigned to the horn without pistons formerly much used in the full orchestra. It has a range from B \flat_1 to f \sharp_2 , but the four tones at either extreme are difficult and seldom used. See HORN.

FRENCH INDIA. See INDIA, FRENCH.

FRENCH INDO-CHINA. The general name for the French possessions in southeast Asia, to wit, the Colony of Cochinchina and the protectorates of Tongking, Laos, Annam, Cambodia, and Battambang. (For further information, see these different headings.) French Indo-China is bounded by China on the north, the China Sea on the east and south, the Gulf of Siam on the southwest, and on the west, where the Mekong River was formerly the boundary line between the French possessions and Siam, the line has been pushed, by the Treaty of 1904, farther west at the expense of Siam, in the northwest as well as the southwest. The estimated area and population of French Indo-China in 1914 are given as follows:

	Area in sq miles	Population
Tongking	46,000	8,000,000
Annam	51,000	4,200,000
Laos	108,000	800,000
Cambodia	37,400	1,500,000
Cochin-China	21,900	3,000,000
Battambang		500,000
	256,200	18,000,000

The estimated population for 1921, 20,000,000.

The French emigration to Indo-China is very small, but the Republic is organizing the affairs and improving the commercial and industrial conditions of the country. At the head of the administration is the governor-general in Saigon, under whom are the governor of Cochinchina and the resident superiors of the four protectorates. Kwang Chow Wan, on the China coast, is also since 1900 a political part of Indo-China, having been leased from China for 99 years. Its area is about 190 square miles and its population about 170,000. Luang Prabang, the territory around Battambang, was ceded by Siam in 1907, and is now administered by the Government of Indo-China as a quasi protectorate. Since 1887 a customs union has united these various possessions. In 1912 the imports were valued at \$52,726,427, the exports at \$50,321,959. Of total imports, France and her colonies send about 50 per cent. In 1912 the Philippine Islands received \$6,477,126 worth of rice from French Indo-China. Rice and rice products formed 56 per cent of the exports in 1912. There is little American trade, with the exception of kerosene, owing to the high tariff and the absence of direct lines of communication. Practically all the transit trade is to and from the Province of Yunnan in China, over the Yunnan Railway. The local budget for Indo-

China for 1912 was estimated, in piastres, at 59,580,500. The receipts are derived chiefly from government monopolies, customs, railways, telegraphs, and posts. The Indo-China Bank is a large institution, capital 36,000,000 francs, and is especially engaged in furthering local enterprises. In 1912 there were 1183 miles of railway. The army in 1913 consisted of 10,873 European and 13,816 native troops, all under French officers. The naval force consisted in 1913 of 4500 men.

The beginning of French influence in south-eastern Asia may be traced to missionary efforts. These were begun in the seventeenth century in Siam, whence they spread to Tongking and Annam. A Siamese embassy appeared at the court of Louis XIV in 1685. In 1774 local troubles broke out in Annam, and King Gya-Long was forced to seek shelter with the French Bishop in the Province of Saigon. Military aid on a large scale was promised, but the troubles in France delayed operations until 1802, when, with the assistance of the French, King Gya-Long regained his throne. His dominion extended over what is now French Indo-China. Several French officers remained in his service, and French engineers fortified the chief cities. King Gya-Long gave certain privileges to French and Spanish missionaries, but his successors were less friendly. The advisers of King Minh-man, about 1820, urged him to a policy of repression which turned into persecution. In 1861 the French began the conquest of Cochin China, and in 1867 they established a protectorate over Cambodia. In 1884 Annam was brought into the same relation to the French power. In 1882 the conquest of Tongking was begun and was completed within four years, though the French met with repeated disasters in their conflict with the Chinese. In 1887 the governor-generalship of Indo-China was formed. In 1893 the Laos protectorate, ceded by Siam, was added. In 1898 and 1899 the Kwangchow-wan territory was leased from China, and in 1907 Bat-tambang was ceded by Siam. See ANNAM; COCHIN-CHINA, TONGKING.

FRENCH LANGUAGE. History. The earliest-known inhabitants of the country now called France were the Gauls, or Celts. They spoke the Gaulish, or Primitive Celtic, language, which is the parent stem of Irish, Welsh, Breton, and other modern Celtic languages. (See CELTIC LANGUAGES.) During the first century B.C. the Romans under Julius Caesar conquered Gaul and gradually imposed the Latin language upon its inhabitants. In Rome at this time there were two forms of Latin in constant use—that of the writers and orators, called the *sermo urbanus*, and that of the uneducated classes, known as the *lingua vulgaris*. The soldiers, merchants, and others who came to colonize Gaul used almost exclusively the latter, and the spread of its use was so rapid that by the end of the fourth century A.D. practically every trace of Celtic, excepting in a few remote districts, had disappeared. It was thought for a time that Brittany, because of its insular situation, had offered a last refuge to the old language, but more recent investigations have shown that Latin had been victorious here as elsewhere in France, for the modern Celtic dialect spoken in this province at the present time is apparently due to the exodus of the Celtic inhabitants from the British Isles at the time of the Saxon invasion from the fifth to the seventh centuries A.D.

Henri Estienne and Claude Fauchet, who wrote in the latter part of the sixteenth century, were among the first to note the true origin of the French language, but it is the philologists of the nineteenth century, especially Diez, the well-known German scholar, to whom the honor is due of having established French philology on a scientific basis. Sporadic attempts have been made to prove that the Gauls did not give up the tongue of their ancestors, but that Latin and Celtic possess in common a number of roots, and that French can as easily be traced back to Celtic as to Latin. However, very few scholars give this theory serious consideration, since Thurneysen, *Keltoromanisches* (Halle, 1884), and others have shown that the influence of Celtic on French has been very slight, even in regard to the vocabulary, in which the number of pure Celtic words does not exceed 50. Among the words which have passed thus from the Celtic through the *lingua vulgaris* into French, the following may be noted: Lat-Celt *alauda*, OF *aloe*, from which is derived the Mod. Fr. *dim alouette*, a lark; Lat-Celt *beccō* or *beccus*, Fr. *bec*, beak; Celt *vraca*, Lat. *brāca*, Fr. *biac*, clout, breeches; Celt *bulga*, Fr. *bouge*, closet; Lat-Celt *carrus* (OIr. *carr*), Fr. *char*, Celt. *carruca* > *charue*, ear; Lat-Celt *leuga* or *leuca*, Fr. *lieu*, league; Celt *sagos*, military blouse; Lat-Celt *sagum*, Fr. *sac*, *sagum* or military cloak, etc. French toponymy has preserved a fairly large number of Celtic words.

In the fifth century Gaul was conquered a second time by the Visigoths, Burgundians, and Franks, the last of whom, the strongest of the Germanic tribes, established themselves firmly in northern France, after having been driven back from the southern part of the country by Syagrius in 486. But this time the conquerors adopted the language of the conquered because of their intellectual and moral superiority. Hence the only influence left by the Germanic tribes on the language of Gaul are some 400 words pertaining to war, public and private institutions, names of animals and plants, and household terms. Among these the following may be mentioned: *Franko*, free man, Fr. *franc*, free, and *français*, French, through the Lat. *frankiscus*, *Alaman*, name of a Germanic tribe, OF *Aleman*, Mod. Fr. *Allemand*, *Ludwig*, OF *Loois*, Mod. Fr. *Louis*, ONFrank *bergfrid*, Fr. *beffroi*, belfry, *herberge*, OF *alberge* and *heberge*, Mod. Fr. *auberge*, inn, and *hébergement*, lodging, *faldastol*, OF *faldestool*, Mod. Fr. *fautuil*, armchair, *felt*, OF *feltre*, Mod. Fr. *feutre*, felt, *marahshalk*, horse servant or groom, Fr. *marechal*, blacksmith, marshal, *werra*, Fr. *guerre*, war, etc.

A considerable number of Greek words were introduced into the *lingua vulgaris* at many different periods, either directly or through the literary Latin. Some may have come into France in the sixth century through the Greek colonies along the Mediterranean, such as Marseilles and Nice. Thus, Gk. *βασιδάειν*, Lat. *bastum*, Fr. *bât*, packsaddle, Gk. *βλασφημεῖν*, Lat. *blasphemare*, Fr. *blâmer*, Gk. *βύρσα*, Lat. *bursa*, OF *borse*, Fr. *bourse*, exchange, Gk. *κόλλα*, Lat. *colla*, Fr. *colle*, glue, Gk. *ἡμικράνια*, Lat. *hemicrania*, Fr. *migraine*, megrim, headache, etc. In subsequent periods many words were introduced through the influence of the Church, such as *évêque*, *prêtre*, *hérétique*, *moine*, *basilique*, while still others were borrowed by scholars.

France differed enough from the popular Latin to be called the *Roman*, or *Romanic*. The main transformations undergone by Latin were the disappearance or obscuration of all nonaccented syllables in words (*hospitalem* becoming *hôtel*, *rigidum*, *roide*, *liberare*, *lurver*, etc.), which resulted in a great loss of case forms and tense forms, and the prevalence of analysis over synthesis in syntax (*Petri* becoming *de Petro*, *amari* being replaced by *amatum*, *habeo*, *habet* requiring the subject *ille* and becoming *ille habet*, etc.). As early as the sixth century the historian Gregory of Tours remarks that "the scholarly language [Latin] is no longer understood except by a few people, while the rustic [Romanic] is understood by everybody." From the time of Gregory the homilies of the Church councils began to be translated into the popular idiom, while the *Capitularies*, or royal edicts, of Charlemagne in the eighth century require the dignitaries of the Church to deliver their sermons in Romanic.

At a very early date a marked difference was noticeable between the spoken language of the northern part of France and that of the south, the dividing line extending from Villeneuve (a little to the north of Bordeaux) southeast to Lussac, then north to Angoulême and Mansle, crossing the river Vienne just below L'Isle-Jourdain, east to the river Allier and southeast by Roanne to Saint-Etienne, a short distance south of Lyons. The Saône and the Rhône are considered the eastern limits of French, since beyond these rivers from Besançon on the north to Grenoble on the south a mixed dialect called French-Provençal was used. Among the more important phonetic phenomena which distinguish French from Provençal are the transformations undergone by the free unaccented vowel *a* of Latin, which becomes *e* in French, but remains unchanged in Provençal (Lat *mare*, Prov *mur*, Fr *mer*, Lat *carriacare*, Prov *cargai*, Fr *charger*). These two languages were known anciently as the *langue d'oïl* and the *langue d'oc*, from the words meaning "yes," *oïl* (pop Lat *hoc illi*) and *oc* (Lat *hoc*), in the two respective idioms. The two languages again branched into several dialects or patois. Of those of the *langue d'oïl* five were especially important—those of the provinces of Ile de France, Normandy, Picardy, Poitou, and Burgundy. In the twelfth century the dialect of Ile de France began to prevail over the others, thanks especially to the political predominance of the kings residing in Paris, who gradually succeeded in compelling allegiance on the part of the barons of the provinces. By the end of the fourteenth century the ascendancy of this dialect was complete, and its rivals were reduced to the state of mere patois.

The *langue d'oc* also separated into different dialects, such as Gascon, Languedocien, Auvergnat, Provençal, Limousin, Béarnais, etc. An era of brilliant literary production that reached its height in the twelfth century seemed for a time to assure its supremacy in the future over the *langue d'oïl*. But after the twelfth century it declined rapidly, and though it has not yet fallen back into the condition of a patois, or spoken dialect, principally on account of the efforts of Mistral and other poets, there is little doubt that its days of importance have passed. The *langue d'oïl* was influenced by the *langue d'oc* from the very earliest times, but the importation of Provençal terms probably

reached its height when Henry of Navarre became King of France at the end of the sixteenth century, and southern writers, such as Monluc, Du Bartas, and Montaigne, borrowed freely from their native tongue. A great many of the words contributed by the *langue d'oc* to the *langue d'oïl* have become archaic, so that a modern dictionary will only show some 400 or 500 words in actual use. Among these words the following are the more common: *accolade*, *arguillade*, *alarguer*, *asperge*, *aubade*, *bâcler*, *badaud*, *bague*, *baladin*, *ballade*, *banquette*, *baricade*, *bastille*, *beret*, *bordel*, *bouillabaisse*, *bourgade*, *brancard*, *busserole*, *cable*, *cubrai*, *cadeau*, *cadenas*, *cadet*, *caquot*, *canail*, *cap*, *cape*, *caisson*, *caserne*, *charade*, *cigale*, *dot*, *égant*, *emparer*, *escalier*, *escargot*, *estrade*, *fadaise*, *farandole*, *fat*, *gabelle*, *gavotte*, *jaire*, *lucerne*, *martingale*, *mascotte*, *milan*, *mistral*, *muscat*, *sarrasin*, *soubresaut*, *soubrette*, *troilet*, *troubadour*, *velours*, *viguer*.

During the twelfth and thirteenth centuries French was extensively used throughout Europe. Martino da Canale and Brunetto Latini, two Italian authors, make possibly extravagant claims as to the extent of its use, which they attribute to the fact that it was "more delightful to read and to hear than any other." But we do know that Marco Polo preferred it to his own native tongue when he wrote the account of his voyages to Tartary and China in 1298, and that it was for some time the court language of Naples. In Germany princes and barons engaged the services of French-born tutors for their children, while in England French was the foremost rival of the native tongue during the two centuries immediately succeeding the Norman Conquest (1066) and almost supplanted it as the form of literary expression. Foreign students who were attracted from all parts of Europe to the University of Paris aided greatly in the diffusion of the language. During this period an additional contribution was made to the vocabulary in the introduction of a considerable number of Arabic words due to the prestige enjoyed by Arabian science as well as to the Crusades, through which at the same time French was disseminated in the Orient. Among these words are *alambic*, *alchimie*, *alcoran*, *amiral*, *arsenal*, *azur*, *balais*, *carat*, *chiffre*, *cimetière*, *coton*, *élixir*, *épinard*, *gabelle*, *gazelle*, *grafe*, *goudron*, *haras*, *julep*, *jupe*, *limon*, *luth*, *mameluk*, *matelas*, *nadir*, *nugue*, *orange*, *papegai*, *safran*, *sirup*, *tambour*, *tasse*, *zénith*, etc. The fourteenth and fifteenth centuries, the epoch of the disastrous Hundred Years' War, were less important in the history of the language. Even as early as the tenth century, when the classical Latin had fallen already into complete disuse, a tendency prevailed among scholars to introduce into the current language words taken bodily from Latin, and therefore unmodified by the natural process of transformation through the medium of low Latin and Romanic. It happened, therefore, that a considerable number of Latin terms gave two French words—one of popular, the other of scholarly origin—to which the term "learned word" is usually given. Besides *hôtel*, from Lat *hospitalem*, *hôpital* was formed, so *rigide*, *fragile*, and *libérer*, besides *roide*, *frêle*, and *lurver* from *rigidum*, *fragilem*, and *liberare* respectively. These pairs of words are called doublets. This method of enriching the dictionary became quite common in the fourteenth century and lasted through the fifteenth and

sixteenth The Renaissance served only to encourage this tendency In the seventeenth century, however, a reaction set in, due to a certain extent to Molière, who, desirous of putting an end to the false erudition of his contemporaries, exposed them to pitiless attacks, especially in the third "Intermède" of the *Malade imaginaire*

But it was in the sixteenth century that the first serious attempt was made to regulate the French language, to adopt grammatical rules, and to fix the vocabulary In this laudable undertaking many picturesque and useful words were sacrificed to a need of order and to the fear of impropriety, but the language was in the end the richer thereby, since it gained many excellent dialectical terms and neologisms such as the cherished *patrie* This movement began with the *Deffence et Illustration de la Langue françoise* of Du Bellay (1549) and culminated in the work of Malherbe in the beginning of the seventeenth century Among the old French terms that were proscribed are *ardour* (*brûler*), *cuaider* (*croire*), *desduir* (*plaisir*), *emmy* (*au milieu de*), *ire* (*colère*), *orée* (*bord*), *ost* (*armée*), *prou* (*beaucoup*) Some, like *dénaler* (*descendre*), *fétard* (*parasseyeur*), and others have remained in the colloquial vocabulary

The numerous wars with Italy in the first half of the sixteenth century, together with the admiration of the Pléiade for things Italian, resulted in a formidable invasion of about 800 words, which was only checked by the passionate protestations of Henri Estienne at the close of the century These two distinct influences brought in two distinct classes of words The one consists of expressions borrowed from the sphere of art *arabesque*, *arcade*, *arlequin*, *artisan*, *balustre*, *balcon*, *bouffon*, *burlesque*, *luste*, *carnaval*, *charlatan*, *concert*, *contour*, *corniche*, *esquisse*, *façade*, *feston*, *fugue*, *opéra*, etc The other is composed of military terms *alarme*, *alerte*, *bastion*, *canon*, *caporal*, *carrousel*, *cartel*, *cartouche*, *colonel*, *embuscade*, *escalade*, *estafilade*, *fantassin*, *sentinelle*, *soldat*, *timbale*, *vedette*, etc

In the early part of the seventeenth century there was a similar Spanish invasion, and French was enriched by about 200 words, especially names of animals, or of exotic products, and words of American origin, such as *abricot*, *alcôve*, *bizarre*, *camarade*, *cacao*, *chocolat*, *cigarre*, *coca*, *créole*, *duègne*, *manille*, *marmelade*, *nègre*, *patate*, *sérénade*, *sieste*, *tomate*, *vanille*, etc At the same epoch a few words came from Germany, several wars having more than once brought its inhabitants into contact with the soldiers of France *bivouac*, *blocus*, *fifre*, *haversac*, *hulot*, *lansquenet*, *obus*, *rosse*, *trinquer*, *sabre*, *cible*, *halte*, *rêtre*, *valser* The influence of the *Précieuses* (see FRENCH LITERATURE) cannot be ignored. A few illustrations of expressions coined by them and subsequently taken up in the current language may be of interest here *être de qualité*, *un procédé tout à fait irrégulier*, *une chose du dernier bourgeois*, *donner dans le vrai*, *avoir des lumières sur un sujet*, *avoir l'intelligence épaisse*, etc The Académie Française, founded 1635 (see ACADEMY), has always taken a rather conservative attitude The policy of its members has been from the beginning to record (*constater*), not to innovate The eighteenth century was the period in which France exerted the most remarkable influence over European civilization The glorious reign of Louis XIV had indirectly

contributed to make French an international language It was recognized as such not only by politicians and by the higher society in every country, but even by the scholars who used it in their books to increase the number of their readers It was a few years after the death of Voltaire and Rousseau that the Academy of Berlin established a prize contest on the three following questions "Qu'est-ce qui a rendu la langue française universelle? Pourquoi mérite-t-elle cette prérogative? Est-il à présumer qu'elle la conserve?" The enthusiastic answer of Rivarol, known as the "Discours sur l'universalité de la langue française," was crowned (*ex æquo*, with that of a German, Schwab) The language may have increased in accuracy, clearness, and elegance during the eighteenth century, but it acquired no new qualities It may be said that, by rendering it too perfect, Voltaire robbed French of a part of its strength and originality

The Revolution gave birth to a number of new expressions The Académie had been suppressed by a decree of Aug 8, 1793, the "Sections de Grammaire et de Poésie" of the Institut (founded in 1795) took provisionally its place An edition of the *Dictionnaire* was, nevertheless, published in 1798 by the new men, and as they did not dare to introduce into it the words that had been recently coined, they put them in an appendix Some of them have disappeared, some have remained. Among the latter are *administratif*, *aéronaute*, *assignat*, *bureaucrate*, *carmagnole*, *centralisation*, *club* (pronounced clob), *décade*, *démoraliser*, *divorcer*, *fédéraliser*, *guillotine*, *guilloliner*, *monarchiste*, *polytechnique*, *révolutionner*, *septembriser*, *terrorisme*, etc Most of them, as may be seen, are clumsily constructed In the early part of the nineteenth century the Romantics tried to bring new life into the language by adopting French words which had been given up in the course of previous periods Victor Hugo says of himself, that he has

"tné de l'enfer
Tous les vieux mots damnés, légion sépulcrale"

This, however, was imitation of life, not life itself, and the movement soon died out, until a new and still less successful effort in the same direction was made by the poets of the Symbolist school (especially by the group of the Romanists) in 1896. (See the *Glossaire* by Plowert—pseudonym for Paul Adam) Two events of great importance took place in the second half of the nineteenth century First, the cosmopolitan tendency common at this epoch to all European languages made itself felt in French Its most noticeable result is the influx of English words the more one advances, the more Anglomaniæ seems to gain ground All attempts to check the movement have proved vain Endless lists of these borrowed terms have been made by scholars *bol*, *boze*, *bouledogue*, *châle*, *chèque*, *clown*, *convict*, *dandy*, *drainer*, *fashionable*, *groom*, *handicap*, *humour*, *interview*, *lunch*, *meeting*, *plaid*, *puddler*, *speech*, *sport*, *square*, *steamer*, *tender*, *ticket*, *toast*, *touriste*, *tunnel*, *verdict*, *wagon*, *waterproof*, *whist*, etc The second event is the still greater invasion of scientific terms which are common to all countries *photographie*, *télégraphe*, *téléphone*, *anémomètre*, *antalgique*, *automobile*, *aéroplane*, etc This double current results naturally in a continual proportional decrease of the stock of genuine French words The purity and the beauty of the language do not gain by it,

either, and Petit de Julleville's statement seems to be correct—viz., that the new terms have "demesurément grossi plutôt qu'enrichi le vocabulaire" Littré, Nodier, Jullien, Egger, Darmesteter, Brunot, have raised their voices in vain in the sense of Petit de Julleville. The Académie itself can no longer resist, no less than 2200 neologisms were inserted in the seventh edition of the *Dictionnaire* in 1878.

The present state of the French language may be tabulated roughly as follows, taking as our basis the 32,000 words of the last edition of the *Dictionnaire de l'Académie*

Of Latin stock	3,800
Of early Germanic origin	400
By derivation from primitive words (such as <i>richard</i> , <i>emrich</i> , <i>trou riche</i> , <i>pauvrette</i> , from <i>pauvre</i>)	7,800
Of foreign and scholarly origin	20,000
	<hr/> 32,000

Moreover, the style cannot be said to have improved. The simultaneous influences of science and realism have dried it up, and that of the newspapers, which grows daily, is a constant source of corruption. However, a few individual writers, like Renan and Anatole France, Remy de Gourmont and Barres, in the second half of the nineteenth century, as Châteaubriand at its opening, have gloriously upheld the traditions of pure and elegant French.

French is used by about 40,000,000 people. It is the language of the greatest part of France (Brittany and a few southern districts only being excepted), of part of Belgium and Switzerland, and part of Canada. If English has become the predominant language in civilized countries, French is still considered the most refined among the leading idioms of the earth.

It has been proposed several times as an international language, especially by Schwab, a German (1784), and recently by Novicov, the Russian economist, and by H. G. Wells, in his volume *Anticipations*.

Grammar and Syntax For the early period, see ROMANCE LANGUAGES. For a long time no uniform system of orthography existed. If one reads, e.g., the fable of "The Wolf and the Lamb," by Marie de France (thirteenth century), it will be found that within 38 lines the word for lamb is spelled in six different ways, and that for wolf in four. The example of Rabelais who wrote the word for oil in three different ways within the space of six lines is often quoted. We have seen that the regulation of the language began in the sixteenth century. At once two schools were formed disputing over the best method of spelling, one of these demanded etymological, the other phonetic, orthography. As erudition was in favor at the time, the phonetic system had to yield, and a number of useless letters were wrongly introduced under the pretext of etymology: *d* in *poids*, *b* in *devoir*, *l* in *cheval*, *voult*, and even *poult*, *diner*, a contraction of *déjeuner*, was written *dinper*, as if from the Greek *deipnēiv*.

In the seventeenth century a number of these letters were dropped, but new attempts at phonetic spelling failed once more. Grammar and syntax at this period are still in a state of disorder. The greatest writers are at variance as to the gender of certain words; the existence of rules for the use of the partitive article and of the personal pronouns is only vaguely suspected, the comparative is occasionally used for the superlative, the participles,

present and past, agree or do not agree at the will of the writer. It was, however, at that epoch that the present rules of the agreement of participles was formulated by Vaugelas, in his *Remarques sur la langue française*. Briefly, it may be said that the seventeenth century observed the logical rather than the grammatical connection of words.

In the eighteenth century the rules established during the previous period were gradually carried out, and the liberties of syntax and orthography were dropped one by one. Owing to the influence of the experimental philosophy, requiring precision of style, the sentences became gradually shorter, while the long harmonious period of the classical age fast disappeared. Already at the close of the seventeenth century, Bayle protests against this simplification of style, which he considers a degeneration. "Ils recommencent une période à chaque ligne, c'est prendre le parti le plus facile, un paresseux s'accommode fort de cela." The Académie, in the 1742 edition of its *Dictionnaire*, drops a number of double letters, replaces the *s* by a circumflex before a consonant (*blâme* for *blasme*), and in a few cases substitutes an *i* for the *y*. In the edition of 1762 other innovations have to be recorded—viz., the distinction of *i* and *j* and of *u* and *v*.

The early part of the twentieth century was an era of orthographic reforms. After 1890 societies were organized in France, Belgium, and Switzerland in order to bring about the desired improvements. They established a special organ, *Le Réformiste*, edited by Jean Barès, who made his fortune in South America and devoted considerable sums of money to the cause. In 1903 the Minister of Public Instruction (then M. Chaumé) appointed a commission composed of the best scholars, e.g., Gaston Paris, F. Brunot, P. Meyer, L. Havet. The report written by P. Meyer and handed in in 1905 marks a date in the movement, in the main it was very favorable to reform. The French Academy refused to accept most of the propositions. A new commission had to be appointed for consultation. The report, written by M. Brunot, was handed in in June, 1906.

Phonetics For early period, see ROMANCE LANGUAGES. In the sixteenth century the pronunciation of the letters was as variable as orthography. The letters *a* and *e* were interchangeable, the same is true of *ou* and *u*, *ou* and *eu*, *oi* and *ai*. The *e*, rarely accented, assumes different sounds. The consonants *s* and *z*, *s* and *r*, are used freely, the one for the other, *oiseau* and *oizeau*, and while in most cases one of the two forms has disappeared, both *chaise* and *chaire* have continued to be used simultaneously, though with different meanings. Phonetics are in close connection with orthography, and they have been studied with great care since the middle of the nineteenth century, especially with a practical object in view. Lesant, Vogel, and, above all, Paul Passy, Abbé Rousselot, should here be mentioned. Passy's little treatise, *Les sons du français*, is widely known, Eng. trans. by Savory and Jones (Oxford, 1907). Rousselot's *Principes de phonétique expérimentale* (2 vols., Paris, 1901-08) is the standard work on the subject of experimental phonetics. Ch. Nyrop, a Dane, has also made for himself a reputation in this domain. His *Manuel phonétique du français parlé* (2d ed., Paris, 1902) is a model of patient, accurate, and impartial labor. Among the workers

in this field who have come to the front in the United States is Prof J Geddes, Jr, author of a valuable work on *French Pronunciation* (New York, 1913). See PHONETICS.

Versification The chief element of Latin poetry was the quantity of the syllables. This has been altogether given up in French versification. A few poets, especially in the sixteenth century, Baif and Jodelle, eg (see FRENCH LITERATURE), under the influence of the Renaissance, tried to write French poetry according to the Latin system. They never succeeded in producing anything satisfactory.

The elements of French versification are three:

- 1 The number of syllables, from 12 down. The mute syllables at the end of a verse never count, in the middle of the verse the final silent *e* counts only when the following word begins with a consonant. In the Middle Ages the poet was very free, in the classical period he was less so. The Symbolists and other poets of the end of the nineteenth century have frequently allowed themselves as great a liberty as the poets of the twelfth and thirteenth centuries.
- 2 The accentuation. The verse must always end on an accented syllable, and if the verse is divided into smaller parts (eg, 6 + 6, 4 + 4 + 4, 6 + 4, 4 + 4, etc.), each part in its turn must end on an accented syllable. By accented, one must understand the last syllable of a word of importance for the meaning conveyed, or an important monosyllable, such as a noun or a verb. Articles, conjunctions, and prepositions are rarely in place as accented syllables.
- 3 The rhyme. The original form is the assonance, ie, the repetition at the end of a verse of a vowel sound. We find, eg, the following assonances in a stanza of the *Chanson de Roland*: *abe, able, abre, ace, aile, etc.* or *i, id, ilz, vi, etc.* Rhyme is only a more perfect assonance, the letters following the vowel being also made to agree, thus *courage, village*. Still later the consonant preceding the vowel of the rhyme was required to be the same in both words (*consonne d'appui*), thus, *orage, courage*. The latter is called "rime riche" or "pleine," while the other one is only "suffisante."

Different rules concerning the rhyme were added in the course of time: the rhyme was to connect verses two by two, in the sixteenth century it was decreed that two masculine rhymes (ie, ending on a sounded syllable, like *amour, départ*) must alternate with two feminine rhymes (ie, ending on a silent *e*, like *table, fille*). The yoke of the narrow code of versification established by Malherbe and Boileau in the seventeenth century was not shaken off until the time of Victor Hugo and Romanticism. Even their attempts to gain more liberty were temporarily crushed by the poets of the Parnassian school from 1866 onward. The fight was, however, taken up again by the Symbolists: the *vers libre* was the outcome of their sweeping reform. According to them everything—the number of syllables, accentuation, rhyme—depends altogether upon the subjective criterion of each writer, there are as many forms of versification as there are individual poetic feelings. Few of them made much use of the freedom thus regained.

Bibliography The standard work on the history of the language is Brunot's *Histoire de la langue française des origines à 1900* (3 vols, Paris, 1905–11), which has now reached the end of the seventeenth century. Among the philolog-

ical works tracing the development of the language from the Latin to the present time the following are the more important: Nyrop, *Grammaire historique de la langue française* (4 vols, Copenhagen, 1899–1913), Meyer-Lubke, *Historische Grammatik der französischen Sprache* (Heidelberg, 1908), Cledat, *Nouvelle grammaire historique du français* (4th ed, Paris, 1908), Schwan Behrens, *Grammaire de l'ancien français* (2d ed of the F1 trans by O Bloch, Leipzig, 1913), Littré, *Histoire de la langue française* (9th ed, 2 vols, Paris, 1886), Tobler, *Vermischte Beiträge zur französischen Grammatik* (3 vols, Leipzig, 1886–1908). For Old French, consult Foerster, *Altfranzösisches Übungsbuch* (4th ed, Leipzig, 1911), Constans, *Chrestomathie de l'ancien français (IXe–XVe siècles)*, précédée d'un tableau sommaire de la littérature française au moyen-âge (Paris, 1906), Sudre, *Chrestomathie du moyen-âge* (5th ed, Paris, 1910), Voretzsch, *Einführung in das Studium der altfranzösischen Sprache* (4th ed, Halle, 1911), Berthou and Starkey, *Tables synoptiques de phonologie de l'ancien français* (Oxford, 1908), Luquens, *Introduction to Old French Phonology and Morphology* (New Haven, 1909), Bourciez, *Éléments de linguistique romane* (Paris, 1910), Etimayer, *Fortrage zur Charakteristik des Altfranzösischen* (Freiburg, 1910). The best dictionary of Old French is still that of Godefroy (10 vols, Paris, 1880–1901), of which an abridged edition was published by Bonnard and Salmon (ib, 1901). For words of Greek origin, consult Claussen, *Die griechischen Wörter im Französischen* (Kiel, 1903). The following are also worthy of note: Hemme, *Das lateinische Sprachmaterial im Wortschatze der deutschen, französischen, und englischen Sprache* (Leipzig, 1904), Ulrix, *De germaansche Elementen in de romaansche Talen* (Ghent, 1907), Huberts, *Beiträge zur Geschichte der französischen Wörter lateinisch-plebejischer Herkunft* (Kiel, 1905).

For French dialects, the reader should consult, above all, Gillieron and Edmont's *Atlas linguistique de la France* (Paris, 1902–10, Table, 1912), which is the most important contribution made to French dialectology. Other recent works on French dialects that may be mentioned are Bruncau, *La limite des dialectes Wallon, Champenois et Lorrain en Ardenne* (Paris, 1913), Biéhon, *Etude philologique sur le nord de la France* (ib, 1907), Verrier, *Glossaire étymologique et historique des patois et des parlers de l'Anjou* (Angers, 1908), Vieux, *Vocabulaire du patois de Colombert* (Paris, 1911), Lavergne, *Le parler bourbonnais aux XIIIe et XIVe siècles* (ib, 1909), Meunier, *Monographie phonétique du parler de Chaulgnes* (ib, 1912), Leconte, *Contribution à l'étude des littératures orales* (ib, 1910), Juret, *Glossaire du patois de Pierrecourt* (Halle, 1913), Bouillot, *Patois de la commune de la Grand Combe* (Paris, 1910), Millardet, *Etude de dialectologie landaise* (Toulouse, 1910), Gauchat, *Glossaire des patois de la Suisse romande* (Neuchâtel, 1912). For the language of the sixteenth century, consult Henri Estienne (1528–98), *La précellence du langage français*, ed by Petit de Julleville and Huguet (Paris, 1896), Darmesteter, *Le XVIIe siècle en France* (7th ed., ib, 1908–09), Vaganay, "Vocabulaire français du XVIe siècle: deux mille mots peu connus," in the *Zeitschrift für romanische Philologie*, vol xxviii, pp 579–601 (Halle, 1904). For the seventeenth century, besides the

work of Brunot mentioned above, one should consult the grammar of Vaugelas entitled *Remarques sur la langue française* (Paris, 1738), which contains notes by Patriu and Thomas Cornelle. Other works of importance are Haase, *La syntaxe française du XIII^e siècle* (ib, 1898), Godefroy, *L'écrit comparé de la langue de Corneille et de la langue du XVII^e siècle en général* (ib, 1862). On the language of the eighteenth century we have Rivarol, *De l'universalité de la langue française* (ib, 1784), François, *La grammaire du purisme et l'Académie française au XVIII^e siècle* (ib, 1905), Brunetière, "Les transformations de la langue française au XVIII^e siècle," in his *Études critiques sur la littérature française*, pp. 213-259 (ib, 1907), Gohm, *Les transformations de la langue française, 1740-89* (ib, 1903). Consult also the prefaces of the *Dictionnaire de l'Académie*, 1694, 1718, 1740, 1762, 1798, 1835, and 1878.

Among the works dealing with the language of the nineteenth century we may note Deschanel, *Les déformations de la langue française* (Paris, 1898), Remy de Gourmont, *L'Esthétique de la langue française* (ib, 1899), *Les funérailles du style* (ib, 1902), Dauzat, *La langue française d'aujourd'hui* (ib, 1908), Haas, *Neufranzösische Syntax* (Halle, 1909), Armstrong, *Syntax of the French Verb* (New York, 1909), Tesson, *Le verbe raisonné* (Paris, 1909), Plattner, *Ausführliche Grammatik der französischen Sprache eine Darstellung des modernen französischen Sprachgebrauchs mit Berücksichtigung der Volkssprache*, vol. 1 (3d ed, Freiburg, 1912), Pfeiffer, *Die neugermanischen Bestandteile der französischen Sprache* (Stuttgart, 1902). For Canadian French, consult Geddes and Rivard, *Bibliographie du parler français au Canada* (Paris, 1906). The best modern dictionaries are the following: *Dictionnaire de l'Académie* (7th ed., ib, 1878-84), Littié, *Dictionnaire de la langue française* (4 vols, ib, 1889, *Supplément*, ed by Devic, 1910), Hatzfeld, *Dames-teter*, Thomas, *Dictionnaire général de la langue française* (2 vols, ib, 1895-1900), Korting, *Etymologisches Wörterbuch der französischen Sprache* (Paderborn, 1908), Cledat, *Dictionnaire étymologique de la langue française* (Paris, 1912), Stappers, *Dictionnaire synoptique d'étymologie française, donnant la dérivation des mots usuels* (6th ed, ib, 1911), Lafaye, *Dictionnaire des synonymes de la langue française* (8th ed, ib, 1903). On argot or slang, the following should be noted: La Grasserie, *Étude scientifique sur l'argot et le parler populaire* (ib, 1907), Sainean, *L'Argot ancien, 1455-1850* (ib, 1907), *Les sources de l'argot ancien* (ib, 1912), Villatte, *Parisismen* (6th ed, Berlin, 1906). See ARGOT.

With special reference to orthography we have Renard, *La nouvelle orthographe* (Paris, 1894); Barès, *L'Orthographe simplifiée, grammaire française* (ib, 1900), Schinz, "The Simplification of French Orthography," in *Modern Language Notes* (Baltimore, 1906), Brunot, *La réforme de l'orthographe* (Paris, 1905), Du-tens, *Étude sur la simplification de l'orthographe* (ib, 1906), Meyer, *Pour la simplification de notre orthographe* (ib, 1905). For French pronunciation and phonetics, see PHONETICS; ROMANCE LANGUAGES. The most recent and useful works are, besides those mentioned above Passy-Hempl, *International French-English and English-French Dictionary* (New York,

1904), Beyer, *Französische Phonetik* (2d ed, Cothen, 1908), Churchman, *Introduction to the Pronunciation of French* (Cambridge 1907), *Exercises on French Sounds* (New York, 1911), Nicholson, *Practical Introduction to French Phonetics* (London, 1909), Rousselot, *Picris de la prononciation française* (Paris, 1902), Vandaele, *Phonétique du français moderne* (Besançon, 1909), Martinon, *Comment on prononce le français* (Paris, 1913), Ploetz, *Systematische Darstellung der französischen Aussprache* (14th ed, Berlin, 1913), Rosset, *Les origines de la prononciation moderne* (Paris, 1911).

VERSIFICATION Théodore de Banville, *Petit traité de poésie française* (Paris, 1871), Guillaume, *Vers français et prosodies modernes* (ib, 1898), Chatelain, *Recherches sur le vers français au XI^e siècle* (ib, 1908), Grammont, *Petit traité de versification française* (ib, 1908), Kastner, *History of French Versification* (Oxford, 1903), Landry, *La théorie du rythme et le rythme du français déclamé* (ib, 1911), Lote, *L'alexandrin français d'après la phonétique expérimentale* (ib, 1913), id, *La rime et l'enjambement dans l'alexandrin français* (ib, 1913), Martinon, *Les strophes, étude historique et critique sur les formes de la poésie en France depuis la renaissance* (ib, 1911), Rudmose Brown, *Étude comparée de la versification française et de la versification anglaise* (Grenoble, 1905).

FRENCH LITERATURE Until the ninth century of our era, Latin was the literary language of the country which is now called France, and it was not until two centuries later that anything that can be regarded as belonging strictly to French literature made its appearance. To sketch the process by which the tongue spoken in Gaul detached itself from Latin and evolved into a new national language is not within the province of this article. Suffice it here to say that in the seventh century there are references to this new romance language—the *lingua Romana rustica*—and that by the eighth century it was heard even in the pulpits of France. To the last-named century belong the glossaries of Reichenau and Cassel—lists containing in the first instance Latin and Romance (Old French) equivalents, and in the second Old German and Romance equivalents. The oldest linguistic monument of the French tongue, the text giving the oaths interchanged at Strassburg in 842 between the two grandsons of Charlemagne, Louis the German and Charles the Bald, against their brother Lothair, is of the ninth century, and to the tenth century are attributed the earliest quasi-literary documents, the "Cantilène de Sainte Fulaie," a short song celebrating the saint's martyrdom, the "Fragment de Valenciennes," a homily on the prophet Jonas, and the "Life of St Leger" in 240 eight-syllable lines. This brings us to the eleventh century, when the earliest form which finished literature took in France appeared—that of the so-called *chansons de gestes* (or *geste*). But, before considering this form, a conspicuous poem of a religious cast, the "Life of Saint Alexis" consisting of some 600 ten-syllable verses, in five-line stanzas, and belonging to the middle of the tenth century, should have passing mention. To return to the *chanson de geste*. To the end of the eleventh century belongs the flowering of the national epos, the *Chansons de Geste*. These were long poems relating the heroic deeds of Christian knights

(*gestes*, Lat *gesta*, deeds), which were composed, according to the best accepted authority, M. Joseph Bédier, by monks and jongleurs to entertain the pilgrims stopping at the various abbeys on their way to some fair or sacred place of pilgrimage. The monks furnished the material from various legends and from the chronicles, while the jongleurs are supposed to have shaped these stories into the famous epics that have come down to us and which they themselves either read or sang. Both the poets and the singers were for a while a great power in the society of the Middle Ages, as they were able to make and unmake the reputation of a baron by what they chose to sing of him or of his ancestors. Their influence has been compared to that of the newspapers of later centuries. They allowed themselves to be bribed later on, and the kings and the Church had to make severe laws against them. The authors of the *chansons* drew their inspiration mainly from three different sources, and their poems belong accordingly to one of the three groups known as the French, the Breton, and the Classical cycles.

The *Cycle de France* deals especially with French heroes who had put their aims at the service of God and the Church. The central figure is Charlemagne, who is made the great champion of Christianity. The task ascribed to him is the same as Christ's—to conquer the world for God. The great Emperor was represented as surrounded by his vassals, as Christ by His disciples. There were 12 chief barons, the peers of France, as there had been 12 Apostles, one of the Apostles had been a traitor, so there was a traitor (Ganelon) among the 12 peers. God repeated in favor of His kingly servant the miracles He performed formerly for His chosen people. He stopped the sun in its course in order to allow the Christian knights to complete the extermination of the pagans, and at times He sent down His angels to deliver heavenly messages and to help His soldiers in case of great danger. The most ancient, beautiful, and famous of the epics of this group is the *Chanson de Roland*, composed probably at the end of the eleventh century, containing about 4000 verses, whose author is not known. The rear guard of Charlemagne, headed by Roland, is attacked and cut to pieces in the pass of Roncevaux in the Pyrenees, and none escape. It is on this rather thin theme that legend worked and brought forth the great *chanson* in three parts: the betrayal of Roland by Ganelon, the death of Roland at Roncevaux with the 11 other peers and 20,000 men, and the avenging of Roland achieved by Charlemagne. The sincere Christian spirit underlying the whole poem is wonderfully well shown in the beautiful figure of the bishop knight, Turpin. Other remarkable *chansons* of the *Cycle de France* are *Abscons*, *Raoul de Cambrai*, *Garin le Lorrain*, *Les quatre fils Aymon*, *Ogier le Danois*.

The *Cycle de Bretagne* displays an altogether different spirit, as already shown by the second title often given to it, *L'Épopée courtoise*. Its chief poet is Chrétien de Troyes, through whose influence the earlier Celtic mysticism, melancholy brooding, and passionate love element, of the primitive legends were "transformed into an exemplification of the social graces and of courtly love," according to Prof. C. H. Conrad Wright. Chivalrous deeds are here still in great honor, but they are no longer performed for the sake of God and the Church and "la douce

France." A true Christian spirit is rarely present, despite the frequent allusions to the Bible or to ecclesiastical customs, and the use made of certain pseudoevangelical scenes, as, e.g., in the rather extraordinary fusion of the originally pagan legends of Brittany with the Christian legend of the Holy Grail in the last and unfinished poem of Chrétien de Troyes, *Perceval le Gallois*. Love, conceived of as the source of all human virtues and impersonated in fair ladies, may be said to be in this cycle the only power which claims the devotion of knights and barons. The central figure is here Arthur, or Artus, King of Brittany. He also is surrounded by 12 peers, with a traitor (Mordret). The 12 peers are seated at a round table, the symbol of the perfect equality of them all, hence the name of Knights of the Round Table often given to them. The principal poems of the cycle are *Lancelot du Lac*, *Ivain le chevalier au lion*, *Erec et Enide*, *Merlin*, *Tristan*, *Perceval*. In no one does the spirit of the whole cycle come out in its good and bad features so clearly as in the romance of *Tristan and Iseut*. Under strict orthodox appearances the fundamental ideas at work are worldly love and pagan fatality, as shown in the symbolic passion-becoming philtre. Those ideas were added by and to the original story (Consult Bédier's remarkable *Roman de Tristan*, 1905). Shorter poems, treating Breton legends, are in close connection with the *Épopée courtoise*. They are called the *lais Bretons* and were sung like the epics. Love is the only motive, and the *esprit chevaleresque* in the modern sense of the word comes out still more unhampered than before, and even with a foretaste of *préciosité*. The scenes are laid in Brittany or in Wales. Marie de France is the author of these graceful poems. The best known, most refined, and at the same time most characteristic of her sentimental strain are *Elduc*, *Les deux amants*, *Le rossignol*, *Lyonec*. Among the *lais* of other authors may be mentioned *Tydogrel*, *Guingamor*, *Graelent*, *Doon*, *L'Épave*. To the same kind of literature, although the heroes are not from Brittany, belongs *Licassin et Nicolette*, a "chante-fable" of the twelfth or thirteenth century. It gives, half in prose and half in verse, the story of the love of a noble's son for a slave girl, who finally turns out to be a king's daughter.

The *Cycle antique* is the least important of the three groups of epics. The authors turned to antiquity to find new material for their poems, they Christianized Agamemnon, Achilles, Ulysses, and all the heroes of Thebes, Troy, and Rome. The best known among their productions is the *Roman d'Alexandre*, which contains some most extravagant adventures. It was written probably in the twelfth century, by Alexandre de Bernay, has 12,000 verses of 12 syllables, instead of 10, as in the *Cycle de France* and the *Cycle Breton*. The *Roman de Thèbes* and the *Roman de Troie*, belonging to the same group, are composed of octosyllabic lines.

All this mass of epic and chivalrous literature dealt with heroes taken from the higher classes of society and was more particularly written for the nobility. There existed, however, simultaneously a more popular literature. Its products are less pretentious, but just as important as expressing the spirit of their epoch. They are short stories in verse. A good many among the earliest that we possess betray the absolute control of the Church over litera-

ture. The purpose of the *contes dévots* or *contes pieux* was to foster faith among the people and at the same time to bring some consolation for the hardships of life to the lowly. The saints and especially the tender, compassionate Virgin prove always ready to fight the devil or intercede with God in behalf of faithful servants of the Church. As the Church lost its empire over souls, and lay authors began to write, the stories that were written assumed a more worldly character. If a few of the innumerable *fabliaux* or *fableaux* of the Middle Ages may be called didactic, by far the greater number have no other purpose than to entertain. Some are really artistic and graceful, with that touch of satire which is characteristic of the French people, but often the wit and humor are spoiled by coarse realism. Among the best may be mentioned the *Lai d'Aristote*, *Lai de l'oyselet*, *La housse partie*, *Le char palefroi*, *Le vilain nire* (the original of Molière's *Médecin malgré lui*). The *fabliaux*, in which the talent for story-telling of the French nation is for the first time clearly shown, flourished especially during the twelfth and thirteenth centuries. They became rare in the fourteenth. Some of them were used at that time as themes for the stage, but most of them disappear temporarily, to be used again in prose two centuries later.

The satire on the different classes of society makes its appearance on a large scale during the same period in two long poems, *Le roman de Renart* and *Le roman de la rose*. The first is an animal epos of about 32,000 verses, not counting the "branches" which were added later, and which would raise this number to over 100,000. The clergy, nobles, and villains are mercilessly criticized, though seldom with bitterness. Several collections of ancient animal fables written in Latin and known under the name of *Ysopets* (corruption of *Esopets*, or little *Æsop*), together with the *Bestiaires*, compositions ascribing moral traits to real or fantastic animals, had prepared the way for this kind of literature. Marie de France had translated a collection of fables into French verse. There are two sworn foes in the *Roman de Renart*—Isengrin, the wolf, and Renart, the fox, symbolizing strength and cunning. The general idea underlying the different episodes is that evil reigns supreme over society, brute force crushes weakness, cunning alone can overcome strength. In the *Roman de la rose* allegory goes still further: the abstract ideas themselves are personified. A lover wishes to pick a symbolical rose, which grows in a symbolical garden. He is helped in his undertaking by Bel Accueil, Doux penser, Espérance, etc., meanwhile fighting Danger, Male bouche (slander), Jalousie, and so forth. The author of the first 4000 verses, Guillaume de Lorris, had left the poem unfinished. His sole thought had been to offer in a poetical form a kind of code of love. But, 50 years later, Jean de Meun added 18,000 verses, in which, with abundant scholarly references to Ovid and other ancient authors, he directed venomous attacks against women and the conventional affected and false forms that love had assumed at this period, more especially in the higher classes of society. The success of the *Roman de la rose* was considerable, not only in France, where its influence continued far into the seventeenth century, but all over Europe. Imitations and translations appeared everywhere.

Lyric poetry attained a great measure of popularity during the Middle Ages, at first more particularly in the south of France. The songs of the southern *troubadours* dealt equally with morals, politics, and love, while those of the northern *trouvères* were almost exclusively about love, the lofty conception of which was borrowed from the South. But a great number of ballades, pastourelles, chants-royaux, trios, lais, virelais, sirventes, motets, were lost. We know, however, about 200 names of authors, moreover, 600 of these short poems have come down to us anonymously. There were a great many academies named Puy which encouraged lyric and sometimes dramatic poetry by organizing contests and awarding prizes. Among the poets that we know, a special mention is due, in the twelfth century, to Conon de Béthune, Grace Brule, energetic Crusaders and delightful poets, in the thirteenth century, to Thibaut, Count of Champagne and King of Navarre, and Colin Muset, an itinerant minstrel, and in the fourteenth century, to Christine de Pisan, Eustache Deschamps, Guillaume de Machault, and chiefly to Rutebeuf, a Parisian *trouvère* of the Bohemian type, who took great interest in the events of his time, Crusades, Church discussions, and university matters, besides his little masterpieces of lyric and satiric poetry, he wrote a few *contes dévots*, *fabliaux*, and a miracle play. In the fifteenth century Charles of Orléans, after his return from England, where he was a political prisoner for 25 years, and where he wrote most of his poems, made his brilliant court an asylum for letters and art. The greatest of these lyric poets up to the sixteenth century was François des Loges, or de Montcorbier, known to fame as Villon. Owing to the restless charm of his verses, to his absolute sincerity and spontaneity of inspiration, he has more than once been regarded as a kind of patron saint by the lyric poets of the nineteenth century. His chief compositions are two collections of short poems, *Le grand testament*, in which is to be found one of the most famous poems in French literature, "*La ballade des dames du temps jadis*," and *Le petit testament*.

The theatre is the field in which the evolution of literature during the Middle Ages is most clearly shown. At first an institution of the Church, it gradually severed its connection with it, until finally theatre and Church came to be mortal enemies. The *dramas liturgiques* of the eleventh century were representations in the churches of biblical scenes, more especially of the nativity and passion of Christ. They were written in Latin prose and composed exclusively of sentences of the Holy Scriptures. Moreover, the actors were all *clerics*, i.e., officers of the Church. Then came, in the twelfth century, the *drame profane*, or *sécularisé*. The scenes are still biblical, but imagination is permitted to play a greater part, the language is no longer Latin, the actors are laymen, the stage is removed from the church to some public place. The *Représentation d'Adam* is the only piece preserved in its integrity that belongs to this early period of the French stage. The scenes are episodes from the Book of Genesis. They are followed by predictions by the prophets of the coming of Christ, and the performance ends with a sermon describing the terrible signs which will form a prelude to the Last Judgment. In the thirteenth century the scope of the theatre is extended by the addition of miracle plays illustrating the marvelous deeds of the saints and

ular favor during the Middle Ages, at first more particularly in the south of France. The theatre is the field in which the evolution of literature during the Middle Ages is most clearly shown. At first an institution of the Church, it gradually severed its connection with it, until finally theatre and Church came to be mortal enemies. The *dramas liturgiques* of the eleventh century were representations in the churches of biblical scenes, more especially of the nativity and passion of Christ. They were written in Latin prose and composed exclusively of sentences of the Holy Scriptures. Moreover, the actors were all *clerics*, i.e., officers of the Church. Then came, in the twelfth century, the *drame profane*, or *sécularisé*. The scenes are still biblical, but imagination is permitted to play a greater part, the language is no longer Latin, the actors are laymen, the stage is removed from the church to some public place. The *Représentation d'Adam* is the only piece preserved in its integrity that belongs to this early period of the French stage. The scenes are episodes from the Book of Genesis. They are followed by predictions by the prophets of the coming of Christ, and the performance ends with a sermon describing the terrible signs which will form a prelude to the Last Judgment. In the thirteenth century the scope of the theatre is extended by the addition of miracle plays illustrating the marvelous deeds of the saints and

especially of the Virgin Rutebeuf has put in dramatic form the old *fabliau* of St Théophile, whom Mary frees from the clutches of Satan *Le jeu de Saint Nicolas*, by Jean Bodel, another miracle of the same epoch, offers several scenes which have nothing to do with religion. Even a few purely comical pieces, such as *Le jeu d'Adam ou de la feuillée*, by Adam de la Halle, are now represented, though they seem to be an exception. In this same period we find the first example of the pastoral play and comic opera, *Le jeu de Robin et de Marion*.

In the fourteenth century, which, on account of continual political and social disorders, was rather poor in literary productions of any kind, no new step towards emancipation from the church is noticeable. The *Miracles de Notre Dame* remained the favorite theme, while scenes for religious plays are borrowed from all quarters, even from the *chansons de geste* and *romans d'aventure*.

No form of literature is more popular during the fifteenth century than the theatre. *Mystère* is the name given henceforth to religious and even, though rarely, to nonreligious plays, as, e.g., the *Mystère du siège d'Orléans*, which represents the rescue of that city by Joan of Arc, and the *Mystère de la destruction de Troie*. A feverish interest in theatrical representations took hold of the people at that period. The *mystères* were put on the stage with most elaborate machinery. Some of them had over 50,000 verses and lasted several days. There was, however, something artificial about this universal enthusiasm, the plays are prolix, moreover, a tasteless abuse of the comic and coarse elements clearly indicates that the genre had outlived itself. In 1548 the government had to withdraw the license to play from the *Confrères de la Passion*, a society of actors in Paris, on account of the lack of decency in these so-called religious performances, and thus put an end to the mysteries. On the other hand, the profane theatre, free from the influence of the Church, was then coming to the front full of life and vigor.

The three principal kinds of plays in the second half of the fifteenth century are the *moralités*, the *farces*, and the *sotties*. The *moralités* are a genre between the religious and the comic, sometimes grave, sometimes gay, they have a didactic purpose, frequently the characters are allegorical, like those of the *Roman de la rose*, which had set the fashion. The *farces* correspond on the stage to the *fabliaux* in the evolution of the verse story-telling, they are mildly satirical, the main purpose being to amuse. Coarseness is a common feature. Here belongs the first masterpiece of the French comic theatre, *L'Avocat Patelin*, the author of which is not known. The sincerity of its humor and the keenness of its psychological observation are remarkable. The *moralités* and the *farces* were performed by special associations, such as the *Confrères de la Basoche*, in Paris. The *sotties* were played by the *Confrères des Sots* (fools), who only assumed the guise of folly as a stalking-horse for their wit, and for attacks on the clergy, nobility, and all other great personages of the day. Originally they were merely farcical interludes of the mysteries, but owing to their revolutionary character they had to be removed from the latter and thus acquired independent existence.

Except in one domain, that of history, one

may well say that prose does not count in French literature before the sixteenth century. Translations are few. The long *romans d'aventures* that have enjoyed a certain popularity since the thirteenth century are nothing but dicary, prolix repetitions in prose of the *chansons de gestes* and *épopées courtoises*. Leaving aside Wace's *Roman de Rou*, also called *La geste des Normands*, which is a treatment in verse of the history of the dukes of Normandy during the tenth century, there are only a few historians deserving of mention in the twelfth century Villehardouin, who relates, in his *Histoire de la prise de Constantinople*, the story of the Fourth Crusade, in which he personally took part, in the thirteenth century, Joinville (*Mémoires sur la vie de Saint Louis*), one of the vassals of Louis IX, whom he accompanied in his first expedition to the Orient, in the fourteenth century, Christine de Pisan (*Vie de Charles V*), Alain Chartier (*Histoire de Charles VII*), and especially Froissart, who in his *Chroniques* gives a somewhat disconnected but most vivid picture of the brilliant period of the *chevalerie* (his authorship of many of the best chapters is now questioned), in the fifteenth century we have in the *Mémoires* of Commines the first connected account of political events from the point of view of a statesman—he has many ideas in common with Machiavelli and is the precursor of many eminent philosophical historians in France, of the type of Bossuet, Montesquieu, Guizot, Thiers, Michelet, and Taine.

The sixteenth century was a period of transition, marked by the penetration into France of the ideas of the Renaissance. As regards the stock of ideas available for artistic purposes, it must be acknowledged that French literature had become rather thin since the time of the great epics. Italian influence then introduced a more artistic and intelligent understanding of the classical authors of Rome and an extremely stimulating, if superficial, acquaintance with the philosophies of Plato and Aristotle, poorly interpreted before that time in France. This revival gave rise to two opposing factions of humanistic scholars—the Hellenists, who only admired the Greek authors, and the Ciceronians, who advocated the exclusive imitation of Cicero. The humanistic movement introduced a rationalistic philosophy, based on the harmony of mind and matter and the belief in the goodness of nature, all of which was tempered with a desire to imitate the Greek form of highly polished art. The individualistic note, which was destined to be silenced temporarily during the seventeenth century, came from the struggles of the Reformation against the despotic authority of the corrupt powers of the Church. Thus, the sixteenth century, in France at least, is permeated for the most part by Platonism and Individualism. In 1531 Francis I had established the Collège Royal de France (now Collège de France), in which only Hebrew, Latin, and Greek were at first taught, other studies coming later. The influence of this institution was almost instantaneous, and a rich harvest of scholars was the result. Among them were such men as Budé, Daurat, Pierre de la Ramée, and especially two who acquired a world-wide reputation—Jacques Amyot, thanks to his admirable translation of the *Lives* of Plutarch, and Henri Estienne, the author of the *Thesaurus Linguae Graecae* (a work of immense erudition for the time), of the *Traté de la conformité du*

langage français avec le grec, and of the *Précélence du langage français*, in which he protests against the invasion of Italian idioms that was taking place at this epoch. See FRENCH LANGUAGE.

The influence of the Renaissance was especially marked in the domain of poetry. The last poet in the manner of Rutebeuf and Villon was Clément Marot. In his epistles, ballades, elegies, epigrams, etc., we find the same wit and satirical humor as in the work of his predecessors. He was, however, by no means a stranger to the new opinions, his attitude in religious matters roused persecution, against which he had to take refuge in Italy, where he died. His disciple, Mellin de Saint-Gelais, created a permanent place for the sonnet in French poetry. Moreover, his translations of authors like Vergil and Ovid prove his interest in ancient literature. Lemaire de Belges deserves mention here, for, while a product of the preceding generation, the lyric note of his poetry foreshadows the spirit of the Renaissance, his works inspired much in Ronsard's *Franciade* as well as in Rabelais's *Gargantua*. But it remained for the poets of the next generation to give vent in their original compositions to the new spirit created by the Renaissance. Seven of them—the poets of the Pléiade, Daurat, Du Bellay, Ronsard, Belleau, Jodelle, Baif, Pontus de Thiard—combined their efforts to bring about a new literary era. Their aspirations are set forth theoretically in Du Bellay's *Défense et illustration de la langue française* (1549), and practically in a great number of poetical writings. Ronsard is, by common consent, considered the head of the group. With the sole exception of tragedy, he endeavored to resuscitate all the genres of antiquity, even the epos (*La franciade*), and furthermore adopted the Italian sonnet, which had come in along with the Renaissance. The three directing principles of the school are (1) their contempt for the light French poetry of the foregoing centuries, such as Villon's and Marot's, (2) their belief that one who wishes to do truly artistic work must study the ancients and imitate them, (3) their love for French vernacular. With regard to the last point the work of the Pléiade has been long misunderstood. They have been accused of overloading French with strange words. On the contrary, they protested, as a matter of fact, against the tendency manifested by many unintelligent Humanists to introduce into French a number of Greek and Latin terms which gave the language a false air of erudition and made it heavy and inharmonious. A famous verse of Boileau on Ronsard,

"Mais sa muse en français parlait grec et latin,"

is responsible for the error of three centuries. Malherbe, though himself convinced of his complete disagreement with Ronsard, was really aiming at the same goal, i.e., the purification and refinement of the French language and poetry. But while Ronsard was a true artist, who could rely upon his literary tact and feeling, Malherbe had the spirit of system, requiring rules in all places and at all times, to the detriment of spontaneity and inspiration. Malherbe's mantle was taken up later by Boileau, a man fashioned like him in the schoolmaster's world, and it is he who is responsible to no small degree for the stiffness of French poetry in the great century of its literature. The yoke

of Malherbe was unbearable to most poets of real talent. Both Desportes and Berthaut followed Ronsard, while Mathurin de Regnier (the earliest representative of modern French satire) and Théophile de Viau deliberately attacked Malherbe, claiming the rights of freedom and originality.

Jodelle, one of the members of the Pléiade, entered the only field left untouched by Ronsard in his imitations of ancient literature, and wrote his tragedy, *Cléopâtre*, in which, for the first time in France, the unities of place, time, and action were introduced through the indirect influence of Seneca, whose dramatic theory was confused with that of Aristotle, and to whom the idea of the three unities was falsely attributed. Garnier followed in the steps of Jodelle. Larivey imitated servilely the Italian comedy, but had the honor to provide Molière with several suggestions. This century, which only raised the plot from the setting of the peasantry to that of the bourgeois, first divided the comedy into acts and scenes, it contributed but little to the dramatic field, especially with regard to higher comedy, which was to be essentially an Italian importation.

In the domain of fiction, the short story in prose, already in favor in the fifteenth century when the collective work of the *Cent nouvelles nouvelles* appeared, is at its best with Marguerite de Navarre, the sister of Francis I. She wrote (perhaps not without help) the *Heptameron*, an imitation of Boccaccio's *Decamerone*. Part of her material is taken from the *fabliaux*. Bonaventure Despériers, her secretary, cultivated with success the same genre. The art of story-telling is also remarkably exemplified in the *Mémoires* of La Noue and in Biantôme's *Grands capitaines* and *Dames galantes*. Blaise de Montluc also furnished most interesting military *Mémoires*, while scientific discoveries were recorded by Bernard Palissy and Ambroise Pare. The writer who succeeded best in absorbing all that is good in antiquity, without losing the grace and freshness of French wit and humor, is Michel de Montaigne. In his delightful *Essais* the philosophy and belief of the Middle Ages are compared with those of ancient civilization, and the result is the refined and gentle skepticism which has made the "Que sais-je?" of its author a watchword the echo of which will be heard in Shakespeare, throughout Descartes and Pascal, and even in our own Emerson. What Montaigne had said, with seductive art and complete freedom from pedantry, was repeated with all the apparatus of logical demonstration by his friend Charron in *De la sagesse*.

When Rabelais, the greatest literary figure in the sixteenth century, appeared, the conditions all over Europe were exceedingly precarious and the prospect for the future very gloomy. France had not yet recovered from the Hundred Years' War; Rome had been sacked by the French troops, and the Pope was no longer secure in it, Germany was the prey of terrible religious disorders, the Peasant Revolt, and the movement of the Anabaptists, finally, the Turks were threatening Christianity in the East. Yet Rabelais had the courage to break out in Homeric laughter. In his *Histoire de Gargantua et de Pantagruel*, really composed of five separate books, he ridiculed the murderous political wars of the time, the quarrels of the Church and of the different ecclesiastical orders, the pretentious and shallow erudition of the scholars, the

revolting method by which magistrates and judges rendered justice—in short, all the abuses and follies of the turbulent times, which then marked the course of European civilization. But he is not content with negations, his keen good sense suggests to him a number of useful reforms in all the domains of life, education, science, religion, politics. Some of these reforms have been realized, some of them we are still striving to bring about. The greatest social power in the Middle Ages, the Church, had been severely shaken. At this moment the Reformation appeared upon the scene of which Calvin was chief exponent in France. He was so full of the idea of the absolute authority and power of God that in his *Institution chrétienne*, a masterpiece of logic and deep faith, he does not shrink from the extreme consequences of the theory of predestination. His efforts against Rome were ably supported by Théodore de Bèze and especially Agrippa d'Aubigné, a man of wonderful personality, whose poem in seven cantos, *Les tragiques*, is one of the most powerful outcries of indignation the world has ever heard. To meet the danger of the domination of the League, a few devoted citizens (among them Pierre Pithou, Gillot, Passerat, Rapin) wrote a number of short pieces in prose and verse, in turn satirical, eloquent, comic, and grave, appealing to the patriotic feeling of their countrymen. These compositions were published in book form in 1594 under the title *La satire ménippée*, the first great French political pamphlet. Another political writer of the same epoch was La Boétie, the friend of Montaigne, who in his book *Traité de la servitude volontaire* expressed even then opinions which were formulated two centuries later by Rousseau and by the leaders of the French Revolution.

The seventeenth century is known as the classic century of French literature. It differs from the sixteenth in its greater unity. It carried the French language to a point of literary perfection, a form that will be difficult to surpass, this was attained under the influence of Malherbe, an uninspired poet, but a master of harmonious style and rhythm, who introduced the criterions of the century, pure reason and common sense. Two institutions more particularly contributed to this result—the Hôtel de Rambouillet and the Académie Française. The Marquise de Rambouillet brought together in her salon the most refined and cultivated people of Paris and thus exerted a beneficial influence, moral, social, and literary. There Balzac, "le seul éloquent," first gave utterance to the great French "période oratoire," while Voiture was the foremost representative of the witty, light, amiable side of the French character. Other salons were formed on the model of the Hôtel de Rambouillet, that of Mademoiselle de Scudéry (*les samedis de Sapho*) deserves special mention. The women of the *Grand Siècle*, as Madame de Maintenon, Madame de Montespan, la Duchesse de Bouillon, were highly important factors in the general trend of literary fashions. The habitués of these salons are the "précieux" and "précieuses" whom Molière was to ridicule so amusingly, yet one must not lose sight of the excellent refining results of these coteries. They are apparent, e.g., in the *Lettres* of Madame de Sévigné and in many other representatives of *le style épistolaire* in that century and the next.

The Académie Française was first a private

society of scholars, then transformed more or less willingly, in 1635, at the instigation of Richelieu, into an official state corporation. The Academicians were to publish a dictionary, a grammar, and a rhetoric. The dictionary alone was completed. Vaugelas, the author of the *Remarques sur la langue française*, contributed more than any other to this work. Among the other original members of the Académie are Conrart, its first president, the poets Chapelain, the real sponsor of the famous three unities in French tragedy, Maynard, and Racan, the faithful disciple of Malherbe, Balzac and Voiture, and Furetière, who was expelled for having published a dictionary before that of the Académie.

The great authority in literature, however, was neither the Hôtel de Rambouillet nor the Académie, but Boileau, who with an undeniable critical talent made an undeniable reputation at will, seldom going astray in his judgments. Like Malherbe, he formulated in his *Epîtres* and in his *Art poétique* a code of literature, whatever did not meet its requirements was pitilessly condemned. Poets like Théophile de Viau and Scarron, the creator of the *gémme burlesque* (*Vergile travesti*), are among his victims. He had nothing but contempt for Ronsard and his school, and yet he himself accepted the ancients as the criterion of excellence and even became the chief advocate of classicism in the great "querelle des anciens et des modernes," which raged through many years of the seventeenth century, while Peirault, who had started the debate, was the principal representative of the "modernes." Proceedings of so imperious a character were only the application to the field of literary criticism of the principle of authority which regulated the whole life of the seventeenth century, social, ethical, religious, artistic. If France received strong political unity at the hands of Richelieu and Louis XIV, it was at the expense of that individuality which had characterized so many authors of the anarchistic sixteenth century. Protestantism had been crushed out, not so much on account of its intrinsic defects as by reason of political necessities. Bossuet was really the incarnation of his century in literature, the authority of God, the authority of the Church, the authority of the King, are the themes of his works, and the grandeur which cannot be denied to this epoch can be seen in each sentence written by the "angle de Meaux," whether in his splendid *Oraisons funèbres*, *Sermons*, and *Discours sur l'histoire universelle*, in which the great of this world are like dust before God, or in his *Histoire des variations des églises protestantes*, and his attacks on Fénelon and Quietism, in which he affirms the absolute control of truth by the Roman Catholic church, or yet again in his *Déclaration du clergé de France*, in which he defends the claims of the Gallican church to certain liberties from papal jurisdiction. The same is true of his contemporary Bourdaloue, even more famous than Bossuet in those days for his pulpit eloquence, and, though to a less degree, of Fléchier. Even Fénelon, "le cygne de Cambrai," by humbly accepting the condemnation by Rome of his *Essais sur les maximes des saints*, showed how deep-rooted the idea of social and ecclesiastical hierarchy was in the temperament of that remarkable epoch. He had also to learn by bitter experience what it cost to suggest (in the *Voyage de Télémaque*, written for his royal pupil, the Dauphin) modes of government which did

not agree with the autocratic ways of Louis XIV

In the drama the notion of authority takes a somewhat different form, but is as much emphasized as in Bossuet. Corneille's tragedies, *Le Cid*, *Horace*, *Cinna*, *Polyeucte*, and his comedy *Le menteur*, preach an unconditional surrender to the laws of honor and conscience, of God and the state. Racine, though his artistic tact raised him in many respects above the narrow spirit of his age, is not free from it, nevertheless, as is well shown in his fundamental thesis of the submission of man to his passions (*Andromaque*, *Phèdre*, *Iphigénie*, *Bérénice*, *Britannicus*) and in his illustrations of the omnipotence of God in his later religious plays, *Esther* and *Athalie*.

There are, however, a few men in the seventeenth century who do not assume this attitude of deference to conventional grandeur and worldly power. Chief among these is Molière (pseudonym for Jean Baptiste Poquelin), who attacks in his comedies, on the one hand, the *idola fori* of his contemporaries, as, e.g., the current affectations of the society of his day (*Précieuses ridicules*, *Femmes savantes*, *Bourgeois gentilhomme*), and the false erudition of scholars, especially ignorant physicians (*L'Amour médecin*, *Médecin malgré lui*, *Malade imaginaire*), and, on the other hand, the general views of humanity, as in *L'Avar*, *Tartuffe* (religious hypocrisy), *Don Juan* (affectation of unbelief), and *Le misanthrope*, his masterpiece.

Descartes refused to accept the traditional Catholic foundations of metaphysics. He invented a system of his own, resting on the proposition "Je pense, donc je suis" (I think, therefore I am), but he had to take refuge in Holland, in order to complete and give free expression to his new philosophy—a creed not so different from the orthodox as might be imagined if we were to form our judgment solely from the negative part of the doctrine (*Discours sur la méthode*, *Méditations philosophiques*, *Principes de philosophie*, *Traité des passions de l'âme*). Descartes was also a great writer, whose clear and concise style introduced what the French call *le langage de la philosophie*, and whose Cartesian school definitely established the cold authority of untrammelled reason in this century. Thanks to a most cautious and subtle way of expressing himself, Malebranche, Descartes's pupil, was able to publish with impunity his long treatise *De la recherche de la vérité*. In the line of theology the whole group of the Jansenists, who resembled in some respects the Protestants, especially in their hostility to the teachings of the Jesuit Order, was subjected to persecution. They produced some of the most powerful and original writers of the time—Antoine Arnauld, Pierre Nicole and, above all, Pascal, who has often been called the most profound of French thinkers. His literary bequest is the *Pensées* (notes prepared for a work in defense of the Christian religion and published after his death) and the *Lettres provinciales*, a most forcible and effective satire on the Jesuits. Among the moralists of this epoch are La Bruyère (*Les caractères*, *Pensées*) and La Rochefoucauld (*Maximes*), better described perhaps as clever piecemeal psychologists than as powerful ethical philosophers. Madame de Maintenon, in her letters, deals chiefly with problems of education.

La Fontaine, whom his contemporaries nick-

named "Le bonhomme," is a writer of marked originality. In his charming *Fables* and in his *Contes* (which remind one in their substance and form of the old *fabliaux*) we have once more a representative of the genuine "esprit français" as it existed before the Renaissance. He had fed on all the poetic treasures of antiquity that came in his way and created them, as it were, anew, by his graceful, light, and artistic verses.

Another man who freed himself from the conventionalities of the seventeenth century, and restored the connection with the national artistic tradition of France, is Charles Perrault, the author of the naive and humorous nursery tales. His *Contes* found hosts of imitators, even late into the eighteenth century.

The numerous novels of this period also indicate a revival of the literature of the Middle Ages, particularly in the style of the *Roman de la rose*. But the reconciliation of natural feelings and conventionality is here far from being so complete as in the writings of the two authors just mentioned. The lack of harmony between the two tendencies is disagreeably in evidence in all these tedious novels, many of which extended to 10 volumes. The only outcome of their efforts is an intolerable sentimentalism expressed in the exasperating jargon of "précieuses," who play their parts in the garbs of shepherds and shepherdesses. Let us mention only La Calprenède, and Honoré d'Urfé (*L'Astrée*), and Mademoiselle de Scudéry (*Le grand Cyrus*, *Clélie*), who invented the *carte du tendre* (map of tender feelings) and did in prose what Racan in his *Bergeries* had done in verse and in drama. The first example of the French novel, in the modern sense of the term, is Madame de la Fayette's *Princesse de Clèves*, but it stands by itself. Coarseness disfigures Cyrano de Bergerac's satirical *Histoire comique des états du soleil et de la lune* and his comedy *Le pédant joué*. Scarron's *Roman comique* is a faithful picture in the form of fiction of an actor's life in the century of Molière. Furetière furnished one of the first realistic novels in *Le roman bourgeois*.

The memoir literature continues to enjoy favor in France and to show the real nature of things behind the wings of this century's plastic scenery of dry reason and platonic loves. La Rochefoucauld and the Cardinal de Retz are the two best representatives in this field at this time.

We reach the threshold of the eighteenth century with the *Mémoires* of Saint-Simon, who portrays in a lively style the still brilliant but now thoroughly corrupt court of the last years of the "Roi Soleil." Although rotten at the core, so strongly organized a society as that created by Richelieu and Louis XIV could not fail to hold together for a time, and, until far into the eighteenth century, we have nothing but a servile imitation of the seventeenth century. But after 1750 literature becomes frankly an instrument of propaganda, which will ultimately destroy the existing political, social, and religious powers. Regnard and Dancourt are imitators of Molière, Crébillon takes up the bequest of Corneille and Racine, Chamfort and Rivarol once more echo the spirit of the "précieuses", Florian sometimes reminds one of La Fontaine, Massillon follows in the steps of Bossuet, and D'Aguesseau is a master of pompous style in political eloquence. J. B. Rousseau and his disciple Lefranc de Pompignan are lyric

poets whose writings are in the style of the earlier century, the same is true of Louis Racine, the son of the great dramatist, and also true perhaps of Gilbert, it is only at the end of a life which spanned the century that even Fontenelle learns to appreciate the aspirations of the new generation in his work of popular science, *De la pluralité des mondes*, and inaugurates the art of interpreting in simple attractive style the results of philosophy and science for the general public. The works of other secondary authors, although sprightly and witty, hardly contributed anything towards progress in literature and art. Among them are Marivaux, who wrote exquisite comedies, Piron, Gresset, even Nivelle de la Chaussée, with his *comédie larmoyante*, and Ducis, who tried to introduce Shakespeare into France. At the same time there are on the stage a few plays which announce clearly enough the times that are approaching. Le Sage, in his bitter *Turcaret*, and Destouches, in *Le glorieux*, expose the moral unworthiness of those who claim to rule over their fellowmen by divine right, while Diderot, in *Le fils naturel*, Sedaine in *Le philosophe sans le savoir*, and Beaumarchais in *Figaro*, already affirm deliberately the merits of the bourgeoisie. Diderot in his dramatic writings was the originator of the *comédies sérieuses* and the melodrama, which received their greatest element, pathos, from the *Comédie larmoyante* of Nivelle de la Chaussée. In his drama *Charles IX, ou L'Ecole des rois*, M. J. Chénier directly attacks monarchy as a system of government. And soon after, the brother of the latter, André Chénier, strikes his lyre in favor of the newly conquered liberty, he was, however, to pay with his head for the indignant and patriotic protests that he uttered in his *Iambes* against the horrors of the Terror. Three other descriptive poets, contemporaries of Chénier, call for a passing mention here—Delille (for his poem *Des jardins*), Lambert (*Les saisons*), and Roucher (*Les mois*). The gospel of tolerance gains ground daily, thanks to works like Le Sage's *Gil Blas* and Marmontel's *Contes moraux*, *Bélisaire*, and *Les Incas*, in the domain of the novel, while men like the Abbé Fleury and Rollin in education, and Vauvenargues in ethics, slowly and quietly suggest positive reforms.

If the list of highly talented men in the eighteenth century is very long, that of writers of real genius is short, as compared with the preceding period. At the opening of the century there is Bayle, the scholarly and bold author of the *Pensées sur la comète* and of the *Dictionnaire historique et critique*. As early as 1697 all the traditional doctrines that will be swept away by the Revolution are made a target for his dialectic, and many new ones are announced. He was a precursor of Voltaire and especially of the Encyclopédistes, who used his indirect method of attack against the absolutism of religious doctrines. Besides the advantage of a timely appearance, Voltaire had the considerable advantage of a clear and beautiful style. He is the incarnation of the eighteenth century. In one part of his work, nevertheless, Voltaire plainly belongs to the group of continuators of the traditional and classical literature. His dramas, except a few like *Mahomet* (preaching tolerance), which betrays the age in which its author lived, are patterned exactly after those of the seventeenth century,

his *Henriade*, an epic poem, is another specimen of a literature that belongs still more surely to the past, and the *Siècle de Louis XIV* is the glorification of that France whose standards of life he contributed to tear down in so many other writings. In the *Essais sur les mœurs et l'esprit des nations* he takes up history at the point where Bossuet had left it in his *Discours*, viz., with Charlemagne, but while Bossuet had shown that Catholicism is the great leading power of a progressive world, Voltaire attempts to prove that this sect is the mother of all crimes and has positively prevented progress. Voltaire's criterion was plain common sense, and from this stronghold he attacked indifferently the methods by which he considered that the Church took advantage of the imbecility of human nature (*Lettres philosophiques*), the theistic and optimistic systems of philosophers and theologians, particularly the doctrine of the best possible world of Leibnitz and Shaftesbury (his poem *Le désastre de Lisbonne*, his *Contes philosophiques*, *Candide*, *Zadig*), and the men who deny the existence of God (*Si Dieu n'existait pas, il faudrait l'inventer*). His God, however, is only that of deism, i.e., a Creator who does not interfere with his creation, in other terms, he does not believe in Providence. Voltaire's action and influence are essentially negative. But, nevertheless, his universality of interests, his quick response in favor of one cause or another, especially toleration and justice, have earned him the title of father of French journalism. The only part of his work in which he does not attack others is that in which he tries to spread the scientific ideas acquired in his sojourn in England, especially those derived from Newton's books.

It is from England also, from the empirical philosophy of Bacon and of Locke (whose principal disciple in France was the Abbé Condillac), that the group of writers known as "le parti des philosophes" borrowed the new conception of the world that they substituted for the traditional philosophy, which they had rejected. They embodied the results of their common efforts in the *Encyclopédie*. Diderot, who, though somewhat capricious, was one of the profoundest writers of the time, made this undertaking the work of his life, enrolling his most distinguished contemporaries as his collaborators. D'Alembert the mathematician wrote the *Discours préliminaire*, which established his fame as a writer. It is impossible to mention all those who were connected with the *Encyclopédie* and the "parti des philosophes." It is enough to name Mably, Raynal, Grimm, Helvétius, Holbach, and Condillac. The salons of the time, conducted by a number of very keen and intelligent women, did much to spread the new beliefs. In the field of sociology and politics the most important writer is the Baron de Montesquieu. He began with a most happy and brilliant criticism of the customs of his countrymen in the *Lettres persanes*. Later, in the *Considérations sur les causes de la grandeur des Romains et de leur décadence*, and in his more elaborate work, *L'Esprit des lois*, he does away with the merely speculative and a priori method of Bossuet in treating the philosophy of history and replaces it by the empirical and comparative method which has since been applied with greater thoroughness, but not with greater skill or attractiveness, by modern ethnologists and sociologists.

The most far-reaching in its consequences of the philosophical principles of the eighteenth century was the return to nature. The affected cult of an unreal nature as it was found in the novels of the "précieuses" had to go, and if we find an echo of it in Marie Antoinette's *hameau* at Versailles, no author of mark in the eighteenth century makes use of this old ideal. In 1735 the Abbé Prévost offered a first example of natural and passionate love in his novel *Manon Lescaut*, and a few years later the great naturalist Buffon proved that even in the society of the nobles a more truthful conception of nature was not excluded a priori. He had a mind of a most aristocratic form and in his style continued the great traditions of the writers of the "siècle de Louis XIV.," yet he devoted his life to writing a monumental work, entitled *Histoire naturelle*, in which the nature that he studies with enthusiasm is one created by God and not the one invented by ladies and gentlemen of the court. Most of his opinions are no longer accepted, but they were original at the time and well calculated to foster interest in a subject so long neglected by philosophers and scholars. Of a somewhat different character, but just as strong and sincere, was the love for nature as it appears in Bernardin de Saint-Pierre's *Études sur la nature* and *Harmonies de la nature* and in his romantic idyll *Paul et Virginie*. Then came an eccentric and restless genius, Rousseau, who provided not merely most of the ideas which the Revolution tried to put in practice, but also many of those that have been elaborated one by one in the literature of the nineteenth century by the Romantic and even by the Realistic schools. Extreme in everything, he wrote with an enthusiasm which could not fail to stir a society that had grown accustomed to hear only the dispassionate and cold speech of common sense and dry reason. Endowed with a strange combative disposition, he never rested till he had reached the very roots of the evils of his day, he was not content to attack any particular institution, Church, monarchy, or class privileges, his attacks were directed against society as a whole, and he declared the very system of civilization to be rotten, false, and contemptible. That man is a creature of nature, and that therefore nature must be his teacher, his mistress in everything, was with him a fundamental axiom. If he tore down in his *Discours sur les sciences et les arts*, *Discours sur l'inégalité*, *Lettres sur les spectacles*, he tried to reconstruct in the domain of education (*Emile*), in that of the family (*Nouvelle Héloïse*), and in that of sociology (*Contrat social*). The last mentioned is a treatise in which the author endeavors to trace the origin of every organized society to an original though tacit contract between all citizens; the latter freely decide as to the government they want. This implies not only taking away from the dominant class its privilege of ruling, but also the power of appointing and dismissing magistrates at will. The *Contrat social* became the Bible of the French Revolution, this was the authority to which it appealed when it justified the beheading of Louis XVI. So did his *Nouvelle Héloïse* and his *Confessions* strike the purely personal and lyrical note which inspired the Romantics to dwell on the ego and its various moods.

When the destructive storm of the great Revolution was over, Frenchmen realized that it was

easier in theory than in practice to change an organization rooted in the tradition of hundreds of years. Accordingly the first years of the nineteenth century appear as a period of reaction against the Revolution in the field of literature as well as in the field of politics. Joseph de Maistre preached in beautiful language on the unconditional return to the old regime, nay even to a mediæval theocracy. The belief in Providence was according to him the only satisfactory philosophy, the Church must rule over Europe, and kings be considered as the sacred representatives of God. Chateaubriand, though Catholic and Royalist, takes into consideration more than De Maistre the events of the eighteenth century. In his *Essai sur les révolutions* he maintains the uselessness of revolution, and later, having undergone terrible personal sorrows owing to the cruelties of the Terror, he finds consolation in the Christian faith ("J'ai pleuré et j'ai cru"). The *Génie du Christianisme* written soon after, offers a kind of æsthetic religion for artists rather than a religion for humanity at large. Yet it enjoyed an immense success with his contemporaries, who were tired of negations and greeted with enthusiasm the old belief—even though in a somewhat unusual attire. Chateaubriand, however, is not entirely reactionary, he proves a true son of the end of the eighteenth century when, after his journey to America, he professes a warm admiration for the life of the uncivilized tribes he had visited and for the grandeur of the scenery (*Les Natchez*, *Atala*). He is also a forerunner of the Romantics in his half-autobiographical story *René*, which, with *Obermann* by Senancour and *Adolphe* by Benjamin Constant (the great orator of the Restoration), correspond in France to the note struck in Germany by Goethe's *Werther*. Madame de Staël's great achievement was the reestablishment of the connection with the eighteenth century, and especially with Rousseau. In *L'Allemagne* she advocates the natural and rationalistic religion of Rousseau's *Vicaire Savoyard*, the same work brings out the idea of cosmopolitanism in the intellectual sphere of life which is to be found already in germ in Rousseau, and which prompted her to reveal the genius of Germany to her countrymen. Her two novels, *Corinne* and *Delphine*, defend—like the *Nouvelle Héloïse*—the natural rights of love as against the conventions of social life. The Romantic movement, which has also been traced back to Rousseau, is the most important literary event of the nineteenth century. Its purest product is Lamartine. Individualism had won the great battle begun a hundred years ago. The *Méditations poétiques* and *Harmonies poétiques et religieuses* are like a glorious cry of victory crowning the efforts of the eighteenth century. No bitter experience had revealed as yet the deception that awaits the self-worshiper. One would wish that Lamartine had died before he descended from the heights into the arena of political intrigues and soiled his lofty aspirations by contact with reality. His political career was a failure, though—or perhaps because—he was sincere.

Very soon, taking advantage of its first successes, Romanticism assumed an aggressive attitude towards Classicism. Victor Hugo became the leader of the new school and was joined by Gautier, Sainte-Beuve, Vigny, Musset, Nodier. The great battle by Hugo himself in favor of

Romanticism took place on the stage (*Cromwell*, with its important preface, *Hernani*, *Ruy Blas*, *Marion Delorme*, *Le roi s'amuse*). Alexandre Dumas, the father, and Vigny (in *Chatterton*) supported him. The old school, however, regained a temporary popularity with Ponsard's *Lucrèce*, a play weak in itself, but put upon the stage at the psychological moment when the enthusiasm of the public for Romanticism was beginning to cool. The triumph of Romanticism, with its undue insistence on local color, its exaggerated mysticism, and its indiscriminating disregard for all restraints of classicism, was in any case of short duration. Some of the most prominent writers of the group quietly withdrew (Sainte-Beuve, Gautier), while others loudly voiced the bitter disillusion. The pessimistic but proud poetry of Vigny (*Poésies*) and the tragic youthful outcry of despair of Musset (*Les nuits*, *Souvenir*) are the swan songs of Romanticism. In the domain of fiction the passionate prose of the anarchistic George Sand (*Indiana*, *Jacques*, *Mauprat*) gradually lost its fervor, and in later years she abandoned the fanaticism of her youth and sought the harbor of happiness in an old-fashioned, conventional society.

Ever since the Restoration France has been in danger of a new era of revolutions, and the possibility of having to face another Terror led many to attempt a pacific settlement of the rising social and political difficulties. Among them were the poets Béranger and Casimir Delavigne, the political writers and orators P. L. Courier, Benjamin Constant, Royer-Collard, Lamartine, the historians Guizot, De Tocqueville, Thiers, Blanc, Michelet, the philosophers Cousin, Jouffroy, the Socialist Proudhon, the Catholic writers Lacordaire, Lemennais, Montalembert. All the generous efforts of these men were finally brought to an end by the revolution of 1848, followed three years later by the coup d'état of Napoleon III.

In the meantime Victor Hugo's fame continued to increase. He was a giant well able to stand the final failure of Romanticism without being carried away in the disaster. Moreover, his conception of individualism had always been very different from that of Lamartine, Vigny, and Musset, and his understanding of the needed reaction against Classicism was more radical, more to the point, and also more according to the trend of ideas since the Revolution. Hugo, now the high priest of the nineteenth century, had endeavored to show that man is a tissue of contradiction, a mixture of good and evil, of beauty and ugliness, of grandeur and villainy, with the inference that a king or a nobleman has traits that make him, after all, a very inferior being, while—and this is the chief point—in the humble, the lowest in the social scale, are intimations of sublimity that render him the equal of the most highly honored among men. See particularly the dramas *Le roi s'amuse*, *Marion Delorme*, the novels *Bug Jargal*, *Notre Dame de Paris*, *Les misérables*, and, in the *Légende des siècles*, poems like "Les pauvres gens" or "Le crapaud." Not only are those traits not distinctly romantic, they are even characteristic of the school that was to replace Romanticism, viz., the Realistic. Another important feature that made Hugo a favorite with the masses is his optimism. Though a great satirist in *L'Année terrible* and *Napoléon le petit*, his confidence in

humanity and God was always predominant. This is, among others, the idea which inspires the whole *Légende des siècles*, poems in the epic style, in which the author wished to show how humanity rises constantly from a lower to a higher level of civilization and happiness.

Two other men in the first half of the century took pains to study man under both his ideal and his baser aspect, but, contrary to Victor Hugo's, their portrayals of characters have a pessimistic tone. The first of these is Honoré de Balzac, who in his stupendous *Comédie humaine* is so anxious to remain faithful to life that, for fear of incurring the accusation of undue indulgence, he shows a strong inclination to lay stress on the weakness of man. He is the great master of the realistic novel in France. The titles of his best-known novels are *César Birotteau*, *Eugène Grandet*, *Le lys dans la vallée*, *Peau de chagrin*, *Le père Goriot*, *Séraphita*. The second was Stendhal (pseudonym of Henri Beyle), who in his detailed studies of the psychological springs of human action (*Chartreuse de Parme*, *Rouge et noir*) seems to have still more deliberately assumed the cynical tone of skepticism as to the very possibility of goodness. The public was not ready for Balzac and Beyle, and a whole generation was to pass away before their efforts were duly appreciated. The old standards had first to be disposed of, and this was the task performed by men like Mérimée, Flaubert, Gautier, Barbey d'Aurevilly, and the poet Baudelaire. In turn bitingly sarcastic and humorous, they indicated the shallowness and pettiness which the advent of the bourgeoisie had introduced into art. Flaubert, D'Aurevilly, Mérimée, and Gautier still select the characters of their stories for the most part in the sphere of the romantic, but the method of treatment is evidently realistic. Flaubert's *Madame Bovary* (1857) is in subject and treatment the first great novel of the Naturalistic movement of the third quarter of the century. The victories of science and the success of pessimistic philosophy did much to promote the ultimate triumph of the cause of Naturalism. In the seventies Zola published the first novels of his series *Les Rougon-Macquart*. The subtitle of the work, "Histoire naturelle et sociale d'une famille sous le second empire," is suggestive enough. To the author, and to the brothers Goncourt, who immediately preceded Zola in this newly opened path, man is a mere product of his *milieu* and of the physical laws of nature, especially those of heredity, therefore he can be understood only by means of scientific study, and true literature must be nothing but a collection of scientific cases carefully recorded. Zola was himself the disciple of the philosopher Taine, who had put forth the principle of his system in the introduction to his history of English literature. But Zola had taken only one-half of the theory, laying stress merely on the physiological causes that influence action, another disciple of Taine, Paul Bourget, studied in his novels particularly man's mental mechanism, as Beyle had done earlier, and represents the "roman psychologique," as Zola the "roman naturaliste." Bourget was attracted by the study of the female character on account of its complexity, for the same reason he deals by preference with society women rather than with women of the people. His most characteristic novel is *Le disciple*, see also *Mensonge*, *Cœur de femme*, *Cruelle énigme*, *Duchesse bleue*.

Two of the principal writers in the two domains of the naturalistic and the psychological novel are the genial Alphonse Daudet and Edouard Rod. They allow a touch of human feeling to animate their books, and therefore, although in some respects perhaps inferior from the artistic point of view, enjoy much favor with the bulk of the public. It is not always possible to decide whether an author belongs to one or the other of these two schools, this is, e.g., the case with Ferdinand Fabre and with novelists like Edmond About or Cherbulez. The extreme theories of Naturalism were soon given up. Five disciples of Zola—Rod among them—published a protest against their former master's conception of literature. Zola himself, in his *Trois villes* (Lourdes, Rome, Paris), renounced his pessimistic views of humanity, and in his four *Évangiles* (*Fécondité, Travail, Vérité, Justice*), of which only three had been written at the time of his death, the note of optimism and even of utopianism is dominant. If Naturalism has died out, it has, however, left noticeable traces in the works of novelists up to the opening of the twentieth century. The brothers Rosny and the brothers Margueritte are almost direct descendants of Zola, with a slightly more pronounced tendency towards moralizing, while Maurice Barrès and Paul Adam and L. Descaves discuss not only social but political issues. Again, a tendency to use the psychological method is manifest in authors like Prévost, "Gyp," Estaunié, Mirbeau, and Hervieu. Theuriot, Bazin, and Pouillon are realistic novelists of rustic life. The master of the naturalistic short story is Guy de Maupassant. His sober style seems to be an improvement even upon that of Mérimée, who was usually considered the incomparable model in this field. The stories of Coppée may be mentioned here as belonging to the realistic style, tempered by deep sympathy with the working classes. The names of Villiers de l'Isle Adam, Rémy de Gourmont, P. Louys, and De Régnier offer the best examples of novels written by the modern Symbolists.

As to the stage, since the fight of Romanticism we record the appearance of the prolific Scribe, and the original note struck by Alexandre Dumas, the son, and E. Augier, in their realistic and at the same time hortatory social dramas (*Dame aux camélias, Demi-monde, Fils naturel, Affaire Clémenceau*, by the former, and *L'Aventurière, Le fils de Giboyer, Maître Guérin*, by the latter). They were the forerunners of realism in the drama. For years Labiche, Sardou, Meilhac, Halévy, and Pailleron contrived clever novelties to amuse the stage goers. Meanwhile the theatrical ventures of Zola and Daudet had failed, and it was not until 1882 that Naturalism scored a triumph with *Les corbeaux*, by H. Becque. The success was, however, of short duration, for Naturalism degenerated soon into what has been called "le théâtre rose." Since that time all sorts of plays have appeared on the Parisian stage—satirical by Lavedan and Donnay, social and moral by Curel, Hervieu, Brieux, and Mirbeau, the author of *Les affaires sont les affaires*. E. Rostand's *Romanesques* was a belated satire on Romanticism, in *Cyrano de Bergerac*, his greatest success, the satiric and serious elements are mixed in a most disconcerting manner, while *L'Aiglon* is a more or less happy attempt at historical drama (a genre cultivated also by Hennique, Coppée, and Sar-

dou), in *Chantecler*, he attempted a revival of the *bel esprit français* which was less fortunate. The best among contemporary comic authors are Capus and Courteline. Finally, we should mention a group of artists specially characteristic of an epoch in which antinaturalism is the dominant note, the Symbolists Villiers de l'Isle Adam, Saint-Pol Roux, P. Claudel, and, above all, Maeterlinck. The latter, however, has entered a more usual path in his *Monna Vanna* (1902). A resurrection of the Middle Ages, fashioned on its miracle plays, also took place on the eve of the twentieth century, with M. Bouchor and Vicaire, the *Théâtre de l'Âme* by Schuré, also has a half-mystical note.

The poetry of the last third of the nineteenth century illustrates remarkably well the oscillations of the literary ideals during this period. The spirit of Naturalism made a deep imprint on the devotees of the Muses known as the *Poètes du Parnasse*, or *Parnassiens*. Banville and Th. Gautier insisted, above all, upon a very accurate and, in appearance, scientific verse construction, a pornographic inclination is evident in Baudelaire's *Fleurs de mal*, a pessimistic note in Leconte de Lisle, and a psychological tendency in Sully-Prudhomme, while one notices in Coppée, Richpin, Mendès, the general desire to draw on the lower classes of society for artistic material. Only 15 years after the publication of the first volume of the Rougon-Macquart series and 20 after the foundation of the Parnassian group, a host of new authors came to the front and spared no efforts to shake off the yoke not merely of the poets of the time, but of Naturalism itself. Some of these men, though essentially poets, wrote at times in prose. They called themselves *Symbolistes*, or sometimes *Décadents*, which title, however, was originally a nickname. Instead of looking at things as the Realists had done, they declared that the world is essentially a subjective creation, and that therefore objects and thoughts are better represented and conveyed by means of symbols than by an accurate description. The true field for art is not reality, but the sphere of mobile, subtle sensations and feelings. Symbolism is individualism carried to its extreme limits. They adopted a special vocabulary and a special system of versification. The latter culminated in the *vers libre*, i.e., the verse where nothing but the artistic feeling of the poet decides as to rhythm, number of syllables, and rhyme. The Symbolists recognized as their leaders Paul Verlaine and Stéphane Mallarmé, both of them former adherents of the Parnassian school, the best known are, besides the two already mentioned, Rimbaud, H. de Régnier, Vielé-Griffin and Stuart Merrill (both American by birth), J. Laforgue, J. Moréas, G. Kahn, R. Ghil, Paul Fort. An important group flourished in Belgium, Maeterlinck, Verhaeren, and Rodenbach being the chief members. In some prose authors, such as Huysmans (a former pupil of Zola), and the Sar Peladan, who has created the Order of the Chevaliers de la Rose Croix, related tendencies have assumed the character of a vague artistic mysticism. These authors never succeeded in altogether gaining their point, the mass of the public being unable to follow them in such esoteric compositions. Therefore the next move was a return to theories more accessible to the average mind. Groups of young poets—one in Toulouse, the other in Paris—have led the

way in this new direction. They are known under the name of *Naturalistes*. They speak highly of Zola; but while his attitude towards nature was purely scientific, they endeavor to bring out also its poetical aspects. There is nothing new in this vague pantheism itself, however original it may look after the extreme tendencies of Naturalism and Symbolism. Saint-Georges de Bouhéliér, M. le Blond, and L. Balzacette are the principal *Naturalistes*. Another group of 17 authors was formed still later, their ideals are the same as those of the school just mentioned, but they are more mature poets. Their first manifesto was issued in the fall of 1902. It is a collective publication *Les poètes de l'école française, la foi nouvelle*. Another group of ultrasubjectivists, inspired by the Futurist painters, have tried, under the leadership of Marinetti, a Franco-Italian poet, to form a new school of political expression, but up to 1914 they had made little headway.

Thus the swing of the pendulum becomes quicker and shorter as sects and schools spring up and die away. In reality the twentieth century opens without any prevalent literary ideal, it cannot be said, however, that any kind of artistic manifestation is altogether lacking. The most representative Frenchmen at the close of the last century seem to be the novelist P. Loti, with his vague impressionism, and Renan and Anatole France, whose chief characteristics are a refined dilettantism and amiable skepticism. The advent of a great literary genius is yet to be recorded for the twentieth century. It seems that the present-day brilliant but secondary authors are still showing signs of the influences of Tolstoi, Ibsen, and Dostoyevski. Impartial critics, however, believe that the radical writers are losing some of their vigor, while a certain vague religious mysticism appears to become more and more frequent in contemporary literature, under the guise of a rather opaque symbolism.

History in the second half of the nineteenth century assumed a more and more scientific form of treatment, with Fustel de Coulanges, Renan, Taine, Lavisse, Sorel, and it is considered by many, probably with reason, as belonging no longer to the domain of literature. The same question has even been raised with regard to criticism. Since the admirable work of Villemain, D. Nisard, and especially Sainte-Beuve, there has been a strong inclination towards scientific criticism. Taine, and with a kind of fanaticism Hennequin, systematized it to such an extent as to make it render well-nigh automatic judgments. The reaction was not long in setting in. The two methods in vogue in the last decade of the nineteenth century were that of the dogmatists, like Brunetière and Doumic, who judge works of literature according to their agreement with an objective canon, and that of the impressionists, like Lemaitre and A. France, who allow themselves to be guided solely by their subjective feeling of the beautiful. Critics such as Faguet, Larroumet, Lanson, Pellissier, may be called intellectualists, they aim at impartiality and support their opinions with rational motives. Among the rising stars in criticism in the first years of the twentieth century must be mentioned C. Maucclair, and A. Beaumier, for their openness to new ideas, and E. Charles for his energetic and independent criticism. This department may turn out to be the most important contribution of

this century in the domain of ideas. The solidity of thought of this function of literature is in great measure due to the scientific methods of modern philology, initiated by Dietz and other great scholars, whose example was admirably followed by Fauriel, Filon, Gaston Paris, Paul Meyer, and more recently by Joseph Bédier.

We ought to speak before ending of a deep but almost unconscious conflict, independent of any artistic standard, between two classes of authors—those who endeavor to make literature conform to the tastes of the masses, thus yielding to the democratic spirit of the nineteenth century, and those who try to resist these efforts. Authors like Hugo have been frequently accused of pandering to the popular taste. The great successes in this lower order of literature have lain in the domain of the novel. Foremost in this style is Dumas, the elder, whose *Monte Cristo* and *Three Guardsmen* are familiar to all English readers. Next to him, though not so famous, are men like P. de Kock, E. Sue, A. Karr, Ponson-du-Terrail, Gaboriau, Richebourg, X. de Montépin, Samtine, Souvestre, O. Feuillet, and G. Ohnet.

On the stage a deliberate step towards popular art has been taken by M. Pottecher, who created in 1895 his "Théâtre du peuple" at Bussang, in the Vosges. He has found many imitators at Gérardmer, Ploujean, Béziers, and other towns of France.

Bibliography. *Histoire littéraire de la France*, begun by the Benedictines of Saint-Maur and continued by members of the Institut, of which 33 volumes have been published, coming down to the fourteenth century (1733-1898), Petit de Julleville (ed.), *Histoire de la langue et de la littérature française des origines à 1900* (8 vols., Paris, 1896 et seq.), Nisard, *Histoire de la littérature française* (4 vols., Brussels, 1846-50, last ed. revised by the author, 1879), Albert, *Littérature française* (5 vols., Paris, 1886-87), also shorter histories by Lanson (1b, 1912), Brunetière (1b, 1898), Lantilhac (1b, 1894), Doumic (1b, 1896-1909), Faguet (1b, 1900), and Pellissier (1b, 1902). For individual authors, consult the excellent collection in course of publication since 1887 under the direction of J. J. Jusserand, *Les grands écrivains français*, and the *Collection des classiques populaires*, under the direction of E. Faguet (Paris, 1887-98). In German Birch-Hirschfeld, *Geschichte der französischen Literatur seit Anfang des 16ten Jahrhunderts* (Stuttgart, 1889 et seq.), Morf, *Geschichte der neuern französischen Literatur, XVI-XIX Jahrhundert* (Strassburg, 1898), which provides an excellent bibliography. In English the following may be mentioned Saintsbury, *Short History of French Literature* (London, 1889), Warren, *Primer of French Literature* (Boston, 1889), Kastner and Atkins, *Short History of French Literature* (Cambridge, 1901), C. H. Conrad Wright, *A History of French Literature* (New York, 1912). For treatment of special literary genres not restricted to any one period Morillot, *Le roman en France depuis 1610 à nos jours* (Paris, 1893), Petit de Julleville, *Histoire de la littérature dramatique depuis ses origines jusqu'à nos jours* (1b, 1889), Brunetière, *Les époques du théâtre français, 1636-1850* (1b, 1892), L. Levrault, *La comédie* (1b, 1901). For special periods:

FRENCH REVOLUTION, THE The Revolution of 1789 in France which overthrew the Bourbon monarchy and the old feudal régime In this article the name is employed for the period of French history beginning with the meeting of the States-General at Versailles, in 1789, and ending with the establishment of the Consulate, in 1799 For an account of the condition of France before the Revolution, and the causes that brought it about, see FRANCE

When it was decided to summon the States-General, two important constitutional questions required solution—the distribution of representation among the three orders, and the method of voting in the States-General itself Owing to the somewhat irregular character and procedure of this body, which had not met since 1614, there were no valid precedents which could be followed in 1789 In solution of the first question, a royal decree revived or created certain electoral divisions and provided for the election of 250 delegations of four members each—one from the nobility, one from the clergy, and two from the Third Estate—thus dividing the membership of the States-General equally between the two upper orders and the Third Estate Supplementary decrees provided for special cases which arose and considerably increased the number of members In each electoral district, in conjunction with the election of the members of the States-General, each of the three orders drew up *cahiers*, or lists of grievances, including propositions for new legislation The question of the method of voting was not solved, but the official expectation was that the vote would be by order, which would have required a majority vote of each of the orders to pass any measure This would have been a bar to any vital measure of reform The Third Estate, however, expected and intended to have a vote by head, ie, the three orders should vote as one body, and the

simple majority should suffice to pass any measure. This would have placed the control in the hands of the Third Estate, which would vote as a unit and could depend upon the support of a few liberal nobles and the considerable number of parish priests among the representatives of the clergy. When the States-General met, the nobility and the clergy organized as separate houses, but the Third Estate refused to take any such action, in spite of royal and ministerial pressure, and finally on June 17 declared themselves the National Assembly and invited the nobility and clergy to join the Assembly. When the Third Estate first met on June 20, they found their meeting hall closed, but secured a place of meeting in the building called the Tennis Court (*jeu de paume*), where they took the famous oath not to dissolve until they had given France a constitution. The parish priests, or *curés*, and a few of the liberal nobles then joined the Third Estate. After the fruitless royal session of June 23, in which the King commanded the three orders to meet separately, the remainder of the nobility and clergy, at the royal bidding, joined their fellows in the National Assembly, which came to be called the Constituent Assembly, because of its self-imposed task of framing a constitution. The leader of the Third Estate was Mirabeau (qv), an able but discredited noble who had secured an election as a representative of the Third Estate for Aix.

In July, under the influence of a few ultra-conservative and reactionary members of the royal family and of the nobility, the King assumed a hostile attitude, dismissed Necker, the Minister of Finance, in whom the hopes of a regenerated France largely centred, and concentrated troops on Paris. Insurrectionary movements, by which the masses of the people began to show their interest, broke out in Paris. Blood was shed in the capital on July 12, and on the 14th the Bastille (qv), the visible sign of generations of tyranny, was stormed and partially destroyed. The propertied classes and the business people of the city, to prevent the recurrence of bloodshed and riot and to maintain order, organized a city militia, called the National Guard, and a provisional city government. The King, in alarm, withdrew the troops, recalled Necker, and in response to popular demand visited Paris, where he legalized the provisional measures and recognized Lafayette as commandant general of the New National Guard, and the astronomer Bailly as mayor of Paris, and changed the national colors from the white of the Bourbons to the new and popular tricolor.

Having failed in their attempt to overawe the National Assembly and the people of Paris, the Count of Artois, the King's youngest brother, and other leading reactionaries left France, being the first of the so-called émigrés (qv). Immediately following the capture of the Bastille, local disturbances broke out in many sections of the country, while other parts were swept by a panic known as the "Great Fear." The old administrative machine had broken down, and the nation was without an effective local government. In each locality the cool-headed lovers of law and order organized companies of the National Guard and established a provisional local administration.

On the night of August 4 a report on the condition of the nation was read in the Constituent Assembly and it was followed by the abolition

of the old feudal and manorial privileges. The Assembly did not begin at once the necessary constructive work, but dallied with academic discussion on the rights of man, a declaration of which was adopted, to be a preface to the new constitution. (See ASSEMBLY, NATIONAL.) The King and his ministers failed to show any ability to deal with the crisis, while the attitude of the Queen and the court gave color to rumors and popular fears concerning the hostile designs of the King against reforms. This period of suspense was ended by another outbreak in Paris. A mob, composed largely of hungry women, after some disturbances in the capital, marched to Versailles on October 5, followed by Lafayette and the National Guard. Lafayette rescued the royal family, but did not disperse the mob, and on the following day the National Guard and the mob escorted the royal family to Paris and quartered them in the Tuileries. The Constituent Assembly soon followed and found a meeting place near the Tuileries. Thus far the Assembly had been dominated by admirers of the English constitution, like Mounier and Mirabeau, and by admirers of America, like Lafayette and the Lameths. Although there were some theoretical admirers of republican institutions, still, in practice, all had contemplated a constitutional monarchy for France. Now the most conservative members of the Assembly began to disappear, and slowly more radical principles developed. A symptom of this change was in the organization of clubs, the earliest and most important of which was the Society of the Friends of the Constitution, later known as the Jacobins (qv), from the old monastery in which its meetings were held. The Jacobins became a great political force, because of their system of affiliated clubs in the provinces, with which they were in close communication. (See FEUILLANTS, JACOBINS.) Another important club in Paris was the Cordeliers (qv), under the radical leadership of Danton. Newspapers as well as clubs sprang into existence in 1789, for the censorship ceased to discharge its functions. These papers differed widely in form, regularity of issue, and character. In general their purpose was political, and most of the space was occupied with accounts of the sessions of the Constituent Assembly. The most famous of the journals was the *Moniteur*, the most brilliant was the *Révolutions de France et de Brabant* of Camille Desmoulins, and the most erratic the *Ami du Peuple* of Marat. On November 2 the Assembly decreed the transfer of the property of the church to the nation. In February, 1790, it abolished succession by primogeniture. In June it suppressed all titles of nobility.

The work of drawing up the new constitution went on apace in the Assembly, so that the first draft was accepted by the King on July 14, 1790, the anniversary of the taking of the Bastille, at the Feast of the Federation in the Champ de Mars, in which representatives from all parts of the country participated. The constitution gave the King a suspensive veto on all measures passed by the unicameral national legislature. The legislature shared with the King the control of foreign affairs. The most successful and most enduring portion of the new constitution was the provision made for the reorganization of France into 83 departments, each with its local administration. All officials were to be elected by the people. Another feature of the new arrangements was equally im-

portant because of the opposition which it aroused. This was the civil constitution of the clergy, which reorganized the church upon the lines of the new civil administration and transferred the actual control of the church from the hierarchy to the French state. The clergy were to be paid by the state and were required to take an oath to support the new arrangement. This caused a schism in the church in France, because two-thirds of the priests remained loyal to the Catholic church and refused to take the oath. The Assembly had already confiscated the estates of the church and issued assignats (qv), or a kind of government notes based upon these lands as security. The confiscated lands, comprising one-fifth of France, being thus placed suddenly upon the market, depreciated rapidly in value, and the assignats, owing to new issues, declined more rapidly. The only other important event of the summer of 1790 was the military mutiny at Nancy and its suppression by Bouillé (qv) on August 31. Necker, to whom, of all the King's ministers, the nation had looked for wise and able measures, failed to accomplish anything and retired from office in September, 1790, leaving the King without a single competent adviser. Mirabeau was the one man in public life who possessed real statesman-like ability. Though viewed with suspicion by his colleagues in the Constituent Assembly, and with unconcealed contempt by the Queen and the court, he attempted to place his talents at the service of the nation, through both the Assembly and the King. Though his advice was not accepted, the nation realized that his death, on April 2, 1791, left France without a single statesman to guide her. Worst of all, France was not to be allowed to solve her problems alone. The Queen was in constant correspondence with her brother, the Emperor Leopold II, the ruler of the extensive Hapsburg dominions. This was regarded by the people as treasonable. Both Leopold and Frederick William II of Prussia regarded the events in France with suspicion and desired to save the French royal family from humiliation and possible danger. German rulers had allowed the increasing numbers of the émigrés to gather within their territories and threaten armed invasion of France to rescue the royal family and restore the old order. Contrary to the advice which Mirabeau had given, the King and his family escaped from Paris on the night of June 20, 1791, and fled towards the eastern frontier to take refuge with the émigrés under the protection of the Emperor Leopold. This confirmed the popular suspicion that the Queen was in treasonable correspondence with her brother, and that the King had perjured himself in swearing to support the new constitution. The King and the royal family were halted at Varennes and brought back to Paris.

The summer of 1791 witnessed two unfortunate events which foreshadowed the evil days to come. The first was the unprovoked firing upon a popular meeting in the Champ de Mars, in Paris, on July 17—an event known as the Massacre of the Champ de Mars. The other was the meeting at Pillnitz of Leopold II and Frederick William II in August, and the issue of a joint declaration intended as a warning to the popular party in France. Meanwhile the Constituent Assembly had revised the constitution on more conservative lines and submitted the completed work, the constitution of 1791,

to the King, who took the oath to it on September 14. A new legislature having been chosen according to the provisions of the new constitution, the Constituent Assembly dissolved on Sept 30, 1791.

The new legislature, known in history as the Legislative Assembly, began its sessions on Oct 1, 1791. The Assembly was composed of about 750 members, chosen largely from the middle class, and included no one who had sat in the Constituent Assembly. There were no organized parties in the Legislative Assembly, but two small groups, one liberal and one radical, early came into prominence—the Girondists (qv), so named because their leaders came from Bordeaux in the Department of the Gironde, and the Mountain, who took this name because they occupied the highest seats on the left side of the hall. The majority of the members of the Assembly were moderates or even conservatives, but the Girondists were generally able to carry their measures. Unfortunately the Girondists were theorists and orators and included among their number no person of statesman-like character. Under the leadership of Brissot they became a republican party, and monarchy gradually became unpopular. Differences in regard to the nature of the proposed republic later arose between the Girondists and the Mountain—the one desiring a federal republic like the United States, the other advocating a republic one and indivisible with a centralized administration. The Legislative Assembly enacted stringent measures against the émigrés and the priests who refused to take the oath to support the civil constitution of the clergy. Failing to see that France needed peace in order to complete the solution of her internal questions and to establish a stable form of administration, the Girondists after prolonged discussions secured the passage, on April 20, 1792, of the fatal act declaring war against Prussia and Austria.

Lack of discipline was largely responsible for the failure of the French armies to keep the Austrians and Prussians out of France. The advance of the foreign armies increased the unrest in Paris. Small politicians began to form an organization to use the mob of Paris as a political force. On June 20 they directed a demonstration by the mob, which resulted accidentally in an invasion of the Tuileries. The knell of French monarchy had sounded. King, ministers, and legislators sat helpless awaiting the final blow, while the leaders of the mob quietly but without concealment matured their plans. They usurped the government of Paris, organizing a revolutionary commune. Volunteers were sent to the armies, while others were brought to Paris from Brest and Marseilles, the latter entering Paris singing the patriotic hymn henceforth known as the "Marseillaise." On July 25 the Duke of Brunswick, who commanded the Austro-Prussian army which was preparing to invade France, issued a proclamation against the French Revolutionists which aroused the Parisians to frenzy. On August 10 all was ready, and the revolutionary leaders struck their blow. The Tuileries was stormed and the Swiss Guard was massacred. The royal family took refuge in the hall of the Legislative Assembly, which suspended the King and placed the royal family under strict surveillance in the Temple. A national convention to revise the constitution was called, to be elected not on the restricted franchise provided in the consti-

tution of 1791, but by universal manhood suffrage. Numerous suspects were arrested, and Danton as Minister of Justice acted virtually as dictator. Lafayette in alarm abandoned his army and fled from France, but was seized and imprisoned by the Austrians. Further losses on the frontier resulted in further disturbances in Paris, culminating in the massacres of September, during which about 1000 royalists and non-juring priests in the prisons were slain by the mob. Popular outbreaks also took place in some of the provincial cities. The tide of disaster and disorder was stemmed by the news of the engagement of Valmy on September 20, between Kellerman and the Duke of Brunswick, who vainly cannonaded the French position. On the same day the Legislative Assembly ended its sessions.

The National Convention, composed of about 750 members, nearly 500 of whom were new men, met on September 21 and promptly showed its character by abolishing the monarchy and declaring France a republic. The first weeks of the Convention were marked by the occupation of Savoy and Nice, the successes of the French armies on the Rhine, and the victory of Dumouriez over the Austrians at Jemappes (November 6). In December the King was brought to trial and called upon to answer for alleged acts of treason against the nation. Sentence of death was passed upon him, and on Jan. 21, 1793, he was beheaded. The division of parties, which had been noticeable to some extent in the Legislative Assembly, became marked in the Convention. The Girondists in the beginning possessed a decided majority, but as the party of moderation they showed themselves less able to cope with the many dangers that beset revolutionary France than the thoroughgoing members of the Mountain. As the representatives, too, of the higher bourgeoisie, they were destined to fall before the fierce champions of democracy. The downfall of the Girondist influence began with the trial of Louis XVI, when, against their will, they were compelled to vote to sentence the King to death.

On the frontiers the year 1793 opened with a series of disasters, which emphasized the folly of the declaration on February 1 of war against Great Britain, the Protestant Netherlands, and Spain. Successive defeats were reflected at Paris in successive measures of a vigorous and revolutionary character. Early in March 82 members of the Convention were dispatched to the different departments to raise 300,000 troops, and at Paris a Revolutionary Tribunal was established for the speedy trial of persons deemed guilty of crimes against the nation. The defeat of Dumouriez (qv) at Neerwinden on March 18, and the desertion of that general to the Austrians, were followed in April by the establishment of an executive committee of the Convention, the first Committee of Public Safety, which under the leadership of Danton wielded dictatorial powers of government. Civil war was already developing in France because of the resistance of the Catholic and royalist peasants of the Vendée and neighboring departments in western France to the levy of the 300,000 troops. Up to this time, April, 1793, the Girondists had shared responsibility for every measure of a revolutionary character and had themselves created the instruments of their own overthrow and destruction. But ever since the early weeks of the Convention the Girondists and the Mountain

had been engaged in a life and death struggle, whose end was hastened by the terrible dangers which beset France. Hostile armies had crossed the frontier and were pressing towards Paris. Within was civil war. In the words of Danton, audacious measures were necessary. Danton and the Mountain were prepared to take them. The Girondists wanted to debate when delay was treason. The Girondists were overthrown on June 2, and their leaders expelled from the Convention and placed in custody. The revolutionary commune of Paris, which contained the most radical individuals in power during the Reign of Terror, was placed on a legal footing. In the meanwhile the deputies on mission were working with patriotic aid in the provinces, and 13 armies were organized, equipped, and maintained in the field to serve against foes abroad and at home. A democratic constitution, the constitution of 1793, was speedily drawn up and promulgated, but it never went into actual force. The Committee of Public Safety ruled France from July, 1793, to July, 1794. In conjunction with the Committee of General Security in charge of the police administration, it saved France, though at the expense of the Reign of Terror.

The Great Committee of Public Safety apportioned its work to the different members. Carnot and Prieur of the Côte d'Or dealt with the questions of military strategy and the supply of arms and ordnance, Lindet and Prieur of the Marne had charge of the provisioning of the cities and the armies, Jeanbon Saint-André looked after the navy, Billaud-Varenne and Collot d'Herbois were charged with the internal administration and were the real managers of the Terror, Barère and Saint-Just were the spokesmen of the Committee in the Convention, while Robespierre, as the only member with a reputation, did little work, but was a figurehead who received all the glory and later all the blame for the acts of the Committee as a whole. The services of Robespierre, though not very material, were none the less real, because, hiding behind his great personality, the workers were able, unquestioned and unhampered, to save France. The Great Committee carried out the internal administration by sending out members of the Convention as deputies on mission to the different departments to control and direct the revolutionary authorities established in each locality. Bluster, terror, imprisonment, and a few executions kept most of the departments in order. War and measures of a harsher character were employed against the royalist and Catholic uprisings in the Vendée and Brittany, and against the Girondist insurgents in Caen, Lyons, Marseilles, Toulon, and Bordeaux. Popular indignation against the Girondists became more bitter after the assassination of Marat (July 13) by Charlotte Corday, at the instigation, it was thought, of the Girondists at Caen. By the end of 1793 the Girondist rising had all been suppressed and the leaders, including 21 deputies to the Convention, executed. The Vendéans were completely defeated, but continued to carry on a guerrilla warfare until 1800. Nantes, the largest city in the Vendean country, was the headquarters of the infamous deputy on mission Carrier (qv), who executed more victims than did his colleagues in all the rest of France. At Paris Fouquier-Tinville (qv) and the Revolutionary Tribunal sent about 2600 persons to the guillotine, including

nearly all of the notable victims of the Revolution from Queen Marie Antoinette down to the unsuccessful generals and the nonjuring priests. It is worthy of notice that the number of victims during the Reign of Terror has been greatly overestimated, and that more Frenchmen perished in single battles under Napoleon. The greatest sufferer during the Terror was the Catholic church, which had to expiate its abuses during the ancien régime and to suffer for its refusal to accept the civil constitution of the clergy. The opposition to the church culminated in the spasmodic establishment of the Worship of Reason, marked by the Festival in Notre-Dame at Paris on Nov. 10, 1793. Danton and Robespierre recoiled from such desecration, and the Worship of Reason gradually died out. Later Robespierre tried to establish the Worship of the Supreme Being and inaugurated the new cult by the Festival of the Supreme Being on June 8, 1794. With the introduction of the Revolutionary Calendar in October, 1793, weeks were replaced by decades, and the observance of the Christian Sabbath and of saints' days instead of the *decadi* and the revolutionary festivals became a criminal offense. These revolutionary festivals were celebrated in Paris with great pageants under the direction of the painter David. The measures of the government of the Terror were not alone destructive and revolutionary, such as the Law of the Suspects and the Law of the Maximum, establishing fixed prices for commodities and wages, but included much of a constructive nature. The bases of the civil and criminal codes were the work of the committees of the Convention. Another committee devised the system of national education, afterward slightly modified and established by Napoleon. The military committee under Dubois-Crancé effected the reorganization of the army. The metric system and the French decimal currency were among the other creations of the Convention.

The suppression of civil war and the establishment of internal order permitted the use of all the nation's resources against the foreign foe, and a succession of victories planned by Carnot and made possible by the labors of his colleagues soon began to reward the efforts of the Great Committee of Public Safety. Beginning with the successes of Jourdan at Wattignies (Oct. 16, 1793), and of Pichegru at Weissenburg in December, the invaders were driven out of France, and the French armies were able in the spring of 1794 to take the offensive. The series of victories was crowned by Jourdan in the capture of Charleroi and the defeat of the Austrians at Fleurus (June 26, 1794). Thus, not only at home, but also against the foreign foe, the government of the Terror had justified itself.

The Revolution, however, was destined, Saturn-like, to devour its offspring. Robespierre and the Great Committee of Public Safety felt that the circumstances compelled them not only to crush insurrection and revolt, but also to silence any questioning of their policies and acts. On the one hand, Hébert, Chaumette, and the other leaders of the Commune of Paris were more radical than the Great Committee and incurred the dislike of Robespierre, because of their devotion to the Worship of Reason, and because of the indecent character of the *Père Duchesne*, a series of political tracts published by Hébert. On the other hand, the Great Committee and Robespierre feared Danton, who had begun to suggest that

the Terror had gone far enough. Robespierre and the Committee acted with promptness and vigor. The Hébertists were executed on March 24, 1794, and the Dantonists on April 5. After the death of Danton, Robespierre seemed to be supreme, and at his bidding the Revolutionary Tribunal worked more speedily and sent daily to the guillotine almost as many victims as it had previously done in a week. The Terror was at its height, but the fullness of time had come. The victory at Fleurus rendered further terroristic measures unnecessary. Furthermore, foes of Robespierre began to see that they stood in the way of the coming of his expected reign of peace and virtue and so were troubled for their own safety. Among these were even members of the Great Committee, who conceived the idea of making Robespierre the scapegoat for their deeds. The plot was laid, and on July 27 the blow fell. Robespierre and his two friends in the Great Committee, Couthon and Saint-Just, and others of his followers were ordered under arrest and executed on July 28 and the following days. This was the Revolution of the Ninth of Thermidor and the end of the Reign of Terror.

The remaining 15 months of the Convention were a period of reaction. The Committee of Public Safety, with a changing membership, continued to direct the administration, but the Revolutionary Tribunal was dissolved, the Law of the Maximum was repealed, the deputies ceased to go on mission, and the Jacobin Club, which had been so closely identified with the Terror, was closed. Girondists and Conservatives who had withdrawn from the Convention or had been expelled were recalled. Until the close of 1794 the Convention and the Committee of Public Safety were controlled by the Thermidorians, the men who had overthrown Robespierre. During the winter of 1794-95 they were superseded by the returning Conservatives and Girondists, who devoted the last months of the Convention to an attempt to obtain revenge for their sufferings during the Terror. On April 1, 1795 (12 Germinal), and on May 20 (1 Prairial), bread riots broke out in Paris, and the insurgents clamored for a restoration of the "red republicanism" of 1793. Both insurrections were crushed, the great Terrorists, like Billaud-Varenne and Collot d'Herbois, were deported, and the survivors of the Mountain imprisoned, deported, or executed. This reaction, known as the White Terror, extended to the provinces, especially to southern France, where the vengeance wreaked upon the Mountain was more bloody than the Terror itself. In the summer of 1795 the Convention performed the task for which it had been elected in the summer of 1792 and drew up a new constitution called the Constitution of the Year III. The closing months of the Convention were marked by an unbroken series of military successes and by the first efforts towards the restoration of peace. The United Provinces were occupied by Pichegru and organized as the Batavian Republic under French protection, and the French Minister in Switzerland signed at Basel treaties of peace with Tuscany, Prussia (April 5, 1795), Saxony, Hanover, Hesse-Cassel, and Spain (July). France remained at war with Sardinia, England, Austria, and the Empire.

The Convention was not to close without one more insurrection in Paris—that of the 13th Vendémiaire (Oct. 5, 1795), in opposition to the new constitution. This rising was quelled by

Barras with the aid of Napoleon Bonaparte. The Convention came to an end on Oct. 26, 1795, and was replaced by the Directory, the government established by the Constitution of the Year III. The executive authority was vested in a committee of five directors, and the legislative power was exercised by two houses, the Council of the Ancients and the Council of Five Hundred. By order of the Convention the first directors and two-thirds of the first legislature were to be chosen from the members of the Convention. One member of the Directory and one-third of the legislature were to retire annually, beginning in May, 1797. The new constitution had one fatal fault, it made inevitable a deadlock between the executive and the legislature and provided no means of breaking it except by revolution. Such a deadlock occurred after the elections of 1797 and was met by three of the directors, Barras, Larévellère-Lépeaux, and Reubell, who, by the coup d'état of 18 Fructidor (September 4), expelled their colleagues, Carnot and Barthélemy, and a large number of the members of the two councils, thus preventing the triumph of the party of reaction which had won in the elections. The reverse happened in the coup d'état of 30 Prairial (June 18, 1799), when the councils asserted themselves and seized control of the executive, under the leadership of Sieyès. The directors were assisted in the conduct of the central government by a ministry, which at one time or another included such able men as Talleyrand, Fouché, and Merlin of Douai. The local administration was conducted in an arbitrary manner by national agents appointed by the central government. The government was corrupt, and the reckless management of the finances would have ruined the nation had its coffers not been enriched by the plunder of Italy, sent home by Bonaparte. The measures against the émigrés and the nonjuring priests lost little of their harshness. Though the Worship of Reason had been forgotten, the attempt to give France civil religion continued, and new religions, like "Theophilanthropy," were devised and became the fad of the moment. Society, under the influence of the brilliant and dissolute Barras, the most important of the directors, was corrupt, irreligious, and dissolute. In short, little of importance and nothing of credit marked the internal history of the Directory, and only by the success of its military policy did it justify its existence. In Italy Bonaparte crushed Sardinia and forced her to accept peace, and in a series of campaigns of unsurpassed brilliancy drove the Austrians out of Italy, marched on Vienna, and forced the Emperor, Francis II, to sue for peace, which was concluded at Campo Formio, Oct. 17, 1797. In southern Germany Hoche and Moreau had conducted equally glorious but less successful campaigns against the Austrians. Bonaparte refused to invade England, the one remaining enemy of France, and was encouraged by the directors, who feared him in carrying out his scheme of conquering Egypt as a step towards destroying England's power in India. In spite of his victories the campaign was a failure. The English fleet under Nelson destroyed the French fleet in the battle of the Nile (Aug. 1-2, 1798) and held control of the Mediterranean. Meanwhile, freed from the fear of Bonaparte, the enemies of France once more assumed the offensive. Austria broke the Treaty of Campo Formio and, in alliance with England and Russia, renewed the war. The combined

Austrian and Russian armies, by the victories of Suvaroff at the Trebbia (June 17-19, 1799) and at Novi (Aug. 15, 1799), drove the French into Genoa. The reverses of the French arms and the evil internal conditions caused discerning men like Sieyès, Fouché, and Talleyrand to turn to Bonaparte as the possible savior of France. In response to their invitations he returned from Egypt, and by the coup d'état of 18 Brumaire (Nov. 9, 1799) overthrew the Directory and the councils and established a provisional government, consisting of himself, Sieyès, and Roger Ducos as consuls. A new constitution, the Constitution of the year VIII, was drawn up, establishing the Consulate, with Bonaparte as First Consul, Cambacérès, Second Consul, and Lebrun, Third Consul. A Tribune was to debate proposed laws, which were to be voted upon without debate by the Corps Législatif. Practically the First Consul was dictator, with absolute powers.

Primary Authorities. The files of newspapers, such as the *Moniteur* and *Mallet du Paris*, *Mercure de France*, the memoirs of contemporaries, such as those collected by Berville, Barrière, and Lescure, volumes in the *Collection des documents inédits sur l'histoire de France*, such as Aulard, *Recueil des actes du comité de salut public*, Brette, *Recueil des actes relatifs à la convocation des États généraux de 1789*, and Guillaume, *Procès-verbaux du comité d'instruction publique*, the volumes of the *Collection des documents relatifs à l'histoire de Paris pendant la Révolution française*, such as Aulard, *La société des Jacobins*, the publications of the *Société d'histoire de la Révolution française*, and the *Société d'histoire contemporaine*, the legislative proceedings as given in Buchez and Roux, *Histoire parlementaire*, and Mavidal and Laurent, *Archives parlementaires*, and numerous other publications, such as Kaulek, *Papiers de Barthélemy*, may be mentioned as the most accessible and useful. Special bibliographies on the French Revolution are Tournoux, *Bibliographie de l'histoire de Paris pendant la Révolution française*, and a portion of the *Catalogue de l'histoire de France à la Bibliothèque nationale*. The best short accounts are Mignet, *Histoire de la Révolution française* (1st ed., Paris, 1824, last ed., 1b, 1861), Rose, *Revolutionary and Napoleonic Era* (New York, 1897); Morse-Stephens, *Europe, 1789-1815* (1b, 1893). The best product of modern scholarship is Aulard, *Histoire politique de la Révolution française, 1789-1804* (Paris, 1901). Leading works in English are Morse-Stephens, *History of the French Revolution* (2 vols., New York, 1886-91), and *The French Revolution* (vol. viii of the "Cambridge Modern History," 1904). Of the more famous works, Carlyle, *French Revolution* (1st ed., London, 1837, last ed., 1b, 1910), is a literary appreciation, Thiers, *Histoire de la Révolution française* (1st ed., Paris, 1823-27), is now useful only for the Directory, Quinet, *La Révolution* (1st ed., 1b, 1885), and Taine, *La Révolution* (1st ed., 1b, 1878-85), are philosophical and psychological rather than historical studies, Michelet, *Histoire de la Révolution française* (1st ed., 1b, 1847-53), is the most brilliant literary history in French. Though differing widely in method, bias, and value, the most useful special works are, for international relations, Sybel, *Geschichte der Revolutionszeit von 1789 bis 1800* (5 vols., Düsseldorf, 1853-74; Eng. trans. to 1795, London, 1867-69), Bour-

going, *Histoire diplomatique de l'Europe pendant la Révolution française* (3 vols, Paris, 1865-71), Sorel, *L'Europe et la Révolution française* (8 vols, ib, 1885-1902), for military affairs Jomini, *Histoire critique et militaire des campagnes de la Révolution de 1792 à 1801* (3d ed, 15 vols, and 4 atlases, ib, 1819-24), Chiquet, *Les guerres de la Révolution* (11 vols, ib, 1886-95), Iung, *L'Armée et la Révolution Dubois-Grancé* (2 vols, ib, 1884) and *Bonaparte et son temps, 1769-1799* (3 vols, ib, 1880-85), for naval affairs Mahan, *Influence of Sea Power upon the French Revolution and Empire, 1793-1812* (2 vols, Boston, 1892), Chevalier, *Histoire de la marine française sous la première république* (Paris, 1886), for the émigrés Forneron, *Histoire générale des émigrés pendant la Révolution française* (3d ed, 2 vols, ib, 1884), for internal affairs Aulard, *L'Eloquence parlementaire pendant la Révolution française* (3 vols, ib, 1882-86), Mortimer-Ternaux, *Histoire de la Terreur* (8 vols, ib, 1862-81), Wallon, *Histoire du tribunal révolutionnaire de Paris* (6 vols, ib, 1880-82), *La Révolution du 31 mai et le fédéralisme en 1793* (2 vols, ib, 1886), and *Les représentants du peuple en mission et la justice révolutionnaire dans les départements en l'an 2* (5 vols, ib, 1889-90), Sciout, *Le Directoire* (2 vols, ib, 1895), for the finances Stourm, *Les finances de l'ancien régime et la révolution* (2 vols, ib, 1885), C Gornel, *Histoire financière de l'Assemblée Constituante* (2 vols, ib, 1897), for religious affairs Sciout, *Histoire de la constitution civile du clergé* (4 vols, ib, 1872-81), Aulard, *Le culte de la raison et le culte de l'Être suprême* (ib, 1892), for society Goncourt, *Histoire de la société française pendant la Révolution* (ib, 1854) and *Histoire de la société française pendant le Directoire* (ib, 1855), for the Vendean War Chassin, *La préparation de la guerre de Vendée* (3 vols, ib, 1892), *La Vendée patriote* (4 vols, ib, 1893-95), and *Les pacifications de l'Ouest* (3 vols, ib, 1898-99), P H Gible, *Men and Women of the French Revolution* (Philadelphia, 1906), C Sarolea, *The French Revolution and the Russian Revolution Historical Parallel* (Edinburgh, 1906), E B Box, *Story of the French Revolution* (London, 1907), E Lamy, *Témoins de jours passés* (Paris, 1907), J H Rose, *The Revolutionary and Napoleonic Era, 1789-1815* ("Cambridge Historical Series," London, 1907), A Marty, *La dernière année de Marie-Antoinette* (Paris, 1907), E Daudet, *Récite des temps révolutionnaires* (ib, 1908), C F Warwick, *Danton and the French Revolution* (Philadelphia, 1908), R M Johnston, *The French Revolution* (New York, 1909), P A Kropotkin, *La Grande Révolution, 1789-1793* (Paris, 1909), F M Fling, *Mirabeau and the French Revolution* (New York, 1909), C M Bearne, *Four Fascinating Frenchwomen* (London, 1910); L L T Gosselin, *A Gascon Royalist in Revolutionary Paris, the Baron de Batz, 1792-1795* (New York, 1910), F W A Aulard, *French Revolution A Political History* (ib, 1910), G Le Bon, *Psychology of Revolution* (ib, 1913).

FRENCH RIVER A stream in Ontario, Canada, emptying Lake Nipissing into the Georgian Bay of Lake Huron, after a course of 55 miles (Map. Ontario, D 2). It is noted for its magnificent scenery, and for 150 years was the regular route to the Upper Lakes.

FRENCH SPOILIATION CLAIMS Demands made upon the United States government by American merchants for losses of ships and cargoes between 1793 and 1800 at the hands of the French, whose chief excuse for the depredations was that the United States had violated its pledges under the Treaty of 1778. By the Treaty of Sept 30, 1800, and by the Convention of April 30, 1803, France released the United States from certain treaty obligations, and in return was released from paying the merchants' claims, the United States securing peace at the expense of her citizens. Between 1800 and 1885 some 50 bills to reimburse the claimants or their descendants came before Congress, and appropriations were twice voted, but were vetoed in each case by Presidents Polk and Pierce respectively. No redress was obtained until 1885, when the adjudication of the claims was given to the Court of Claims, and decisions were reached awarding some \$4,800,000 to the petitioners.

FRENCH SUDAN, sū'dan' A name formerly used to designate the territory forming a French dependency in western Africa extending from about 12° W long to Lake Chad, and from the Sahara on the north to the northern boundaries of the countries along the northern coast of the Gulf of Guinea (Map Africa, D and E 3). By the Decree of Oct 17, 1899, French Sudan ceased to exist, being in part allotted to Senegal, French Guinea, the Ivory Coast, and Dahomey, while the remainder was erected into two military territories and the Civil Territory of Upper Senegal and Middle Niger. The Decree of Oct 1, 1902, attached Upper Senegal and Middle Niger to the protectorate dependent upon Senegal, under the name of the Territories of Senegambia-Niger. The Decree of Oct 18, 1904, established the Colony of Upper Senegal and Niger, comprehending a civil territory and the Military Territory of the Niger. All of the possessions above mentioned are within the Government General of French West Africa (qv.). The Military Territory of the Niger was detached from Upper Senegal and Niger and constituted an autonomous administrative subdivision of the Government General of French West Africa by Decree of Sept 7, 1911 (effective Jan 1, 1912). Consult. A L Gatelet, *Histoire de la conquête du Soudan français, 1878-99* (Paris, 1901), H Sarrazin, *Les races humaines du Soudan français* (Chambéry, 1901), C Favard, *France africaine, Sahara et Soudan* (Paris, 1905). See **MILITARY TERRITORIES OF FRENCH SUDAN**.

FRENCH TOWN A township in Monroe Co, Mich, on the river Raisin, about 22 miles southwest of Detroit, formerly the name of a village on the site of the present Monroe. Here on Jan 18, 1813, during the second war between the United States and Great Britain, an American force of about 650, under Colonel Lewis, defeated a force of about 100 British, under Major Reynolds, and of about 400 Indians, under Round-Head and Walk-in-the-Water, the American loss being 12 killed and 55 wounded, and the British and Indian loss, though not definitely known, probably being considerably larger. On the 20th Colonel Lewis was joined

by General Winchester with about 250 men, and on the 22d the combined force was defeated by a force of about 500 British, under Colonel Proctor, and about 600 Indians, under Round-Head and Walk-in-the-Water. In accordance with the orders of General Winchester, who had been captured by the Indians, Major Madison surrendered his troops as prisoners of war, on condition that protection be afforded by Proctor against the Indians. The prisoners who were able to march were taken by Proctor to Malden, Canada, and the wounded were left in the charge of an insufficient guard commanded by Major Reynolds at Freetown. On the 23d the wounded were massacred by the Indians, in what is known as the Massacre of the River Raisin. Of the total American force 397 were killed or were missing, 537 were captured, and only 33 escaped. The British lost about 24 killed and 158 wounded, while the Indian loss, though doubtless very large, was never accurately determined. Throughout the rest of the war "Remember the River Raisin" was used as a battle cry by the frontiersmen. Consult Dawson, *Battles of the United States* (New York, 1858), Cullum, *Campaigns of the War of 1812* (ib, 1879), Johnson, *History of the War of 1812* (ib, 1882).

FRENCH VERSION See BIBLE

FRENCH WEST AFRICA. A French government-general created by Decree of June 16, 1895, to embrace Senegal, French Sudan, French Guinea, and the Ivory Coast (Map Africa, CDE3). The Decree of Oct 17, 1899, dissolved and reallocated French Sudan (qv) and added Dahomey to the government-general. Up to 1902 the seat of government was at Saint-Louis in Senegal, and the Governor of Senegal was also the Governor-General, in that year, by Decree of October 1, Senegal was placed under a lieutenant governor (at Saint-Louis) and the seat of the government-general was transferred to Dakar (Senegal). This decree also attached Upper Senegal and Middle Niger to the protectorates dependent upon Senegal, under the name of the territories of Senegambia-Niger, to be administered by the Governor-General. The Decree of Oct 18, 1904, which established the Colony of Upper Senegal and Niger, defined French West Africa as follows: (1) the Colony of Senegal (which embraces the territories of direct administration forming the actual circumscription of Senegal, and the protectorates on the left bank of the Senegal River, which cease to be a part of Senegambia-Niger), (2) the Colony of French Guinea, (3) the Colony of the Ivory Coast, (4) the Colony of Dahomey, (5) the Colony of Upper Senegal and Niger, (6) the Civil Territory of Mauritania. The estimated area and population (1911) are reported as follows:

	AREA		Population
	Sq km	Sq m	
Senegal	191,600	73,977	1,247,096
Upper Senegal and Niger	782,700	302,200	
Military Territory of the Niger	1,363,700	534,347	6,035,090
Mauritania	893,700	345,058	
French Guinea	239,000	92,278	250,000
Ivory Coast	325,200	125,560	1,927,000
Dahomey	107,000	41,313	1,265,000
French West Africa	3,922,900	1,514,632	11,626,000

By a Decree of Sept 7, 1911 (effective Jan 1, 1912), the Military Territory of the Niger ceased to be a part of the Colony of Upper Senegal and Niger and was formed into an administrative subdivision of French West Africa.

The figures in the foregoing table must not be regarded as having the accuracy of a survey or a census. They are careful estimates, but in the nature of the case cannot be exact. In 1911 and 1912 respectively the general commerce of French West Africa showed imports valued at 150,817,649 and 134,781,982 francs, of which 67,573,618 and 55,336,990 from France and 2,273,595 and 2,516,518 from French colonies, and exports valued at 117,125,103 and 118,567,231 francs, of which 58,552,000 and 57,614,182 to France and 76,213 and 95,281 to French colonies. In 1911 there entered at the ports 2431 vessels, of 4,172,000 tons. Railway in operation (1913), 2400 kilometers, telegraph line, upwards of 20,500 kilometers. The several colonies of French West Africa are in wireless-telegraphy communication. Post offices (1913), 231. The budget for 1911 balanced at 56,250,000 francs. The public debt (Jan 1, 1912) was 156,277,000 francs. See the articles on the colonies included in French West Africa, and consult Henry Chevens, *La mise en valeur de l'Afrique occidentale française* (Dijon, 1907).

FRIEND, WILLIAM (1757-1841). An English reformer. He was born at Canterbury and was educated at Saint-Omer, France, and, after a few weeks spent in business in Quebec, first at Christ's and then at Jesus College, Cambridge, where he studied for orders and took high honors. In 1781 he was chosen fellow, and in 1783 was appointed rector at Madingley, near Cambridge. In 1787 he became a Unitarian, issued an *Address to the Inhabitants of Cambridge to turn from the false Worship of Three Persons to the Worship of the one True God* (1788), and did his best to do away with obligatory subscription to the Thirty-nine Articles as a preliminary to the master's degree. In 1788 he was removed from his office of tutor. Five years later, after travels abroad, he wrote a radical pamphlet, *Peace and Union Recommended to the Associated Bodies of Republicans and Anti-Republicans*, for which he was tried and found guilty of breaking the Statute *De Concionibus*. At this time he seems to have been popular among the undergraduates and to have made a disciple of S. T. Coleridge. He was banished from the university, but continued to hold his fellowship until he was married (1808). In 1806 he went to London and was connected with the Rock Life Assurance Company until 1826. His daughter Sophia married the mathematician Augustus De Morgan and was the mother of the novelist William Friend De Morgan. William Friend was an able mathematician, an excellent Hebraist, and prominent in all radical movements of his time. He wrote *Principles of Algebra* (1796-99) and published an annual called *Evening Amusements, or the Beauty of the Heavens Displayed* (1804-22). His pamphlets, besides those mentioned above, were *Thoughts on Religious Tests* (1789), *An Account of the Proceedings in the University of Cambridge against William Friend* (1793), *Scarcity of Bread* (1795), *A Letter to the Vice-Chancellor of Cambridge* (1798); *Principles of Taxation* (1799), *The Effect of Paper Money on the Price of Provisions* (1801), *A Letter on the Slave Trade* (1817).

FRENEAU, frē-nô', PHILIP (1752-1832) An American poet, born of Huguenot parentage in New York, Jan 2, 1752. When he was a year old his family moved to New Jersey, near what is now Freehold. He was educated by his mother till he was 10 years old, and then was tutored in Latin and Greek by a clergyman. He graduated (1771) from Princeton, where he was a college mate of James Madison, with whom he roomed, and of H. H. Brackenridge (qv). He wrote with the latter for the college commencement a poem on "The Rising Glory of America." He had begun writing verses early, and did much ephemeral work immediately after graduating. After teaching school for a time he studied law and made his first essay in journalism in Philadelphia. In 1776 he made a voyage to the Danish West Indies, serving as mate and acquiring nautical experience. On his return to the United States he did some editing with Brackenridge, then took out letters of marque and made a voyage in a privateer, the *Aurora*, which he had built (1780). In May he was captured by the English, and recorded his experiences on a prison ship at New York in a prose narrative and in a strong poem in four cantos, "The British Prison Ship." He regained his liberty in July, 1780, wrote much in prose and satiric verse in periodicals, collected his poems (1786), and occupied himself as shipmaster and journalist till Aug 16, 1791, when Jefferson made him translator for the State Department and induced him to take charge of the violently Anti-Federalist *National Gazette*. Two years later, on Oct 1, 1793, Freneau retired to his home at Mount Pleasant, N. J., and edited the *Jersey Chronicle* for a year. Then he tried journalism in New York, but soon abandoned it for the sea. He made several voyages, one as far as Calcutta, but retired in 1809 in consequence of the laws restricting navigation. In 1789 he had married Miss Eleanor Forman. An enthusiastic walker, he insisted on returning on foot from the house of a friend, where he had been spending the evening, Dec 18, 1832. He was overtaken by a severe snowstorm, lost his way, and was found dead the next day. Editions of Freneau's poems (which are hard to obtain) were published during his life in 1786, 1788 (containing some prose), 1795, 1809, and 1815. The last was filled with panegyrics on the soldiers and sailors of the War of 1812. The edition of 1786 was reprinted in London and New York, 1861 and 1865. Freneau was the first genuine American poet of marked ability. His best poems are lyrics, such as "The Indian Burying-Ground," "The Wild Honeysuckle," and "Eutaw Springs." He published a few volumes of mediocre prose under the pen name of "Robert Slender." Consult the biography by Mary Austin (New York, 1901), Tyler, *Literary History of the American Revolution* (ib., 1897), Wendell, *Literary History of America* (ib., 1900), E. F. De Lancey, *Philip Freneau, the Huguenot Patriot Poet of the Revolution* (ib., 1891), S. E. Forman, *The Political Activities of Philip Freneau* (Baltimore, 1902), P. E. More, *Shelburne Essays* (5th series, New York, 1908), Paltsits, *Bibliography of the Works of Freneau* (ib., 1903). A complete edition of Freneau's poems was prepared by F. L. Pattee (3 vols., Princeton, 1902-07).

FRENSSEN, frēn'sen, GUSTAV (1863-) A German novelist and clergyman, born at Barlt in Holstein. He studied theology at Tübingen,

Kiel, and Berlin and lived as pastor at Hemme from 1890 to 1902, when he moved to Meldorf. Later, at Blankenese, he devoted himself exclusively to literature. His first novel, *Die Sandgräfin* (1896), showed little originality, his second, *Die drei Getreuen* (1898), showed progress, in *Jorn Uhl* (1901), a strong novel of peasant life, he struck his pace and became famous. An English translation appeared in New York in 1905. His fourth, *Hillegentlei* (The Land of Happiness) (1905), less successful, shows traces of the purpose novel. His next, *Peter Moors Fahrt nach Südwest* (1906), with its interesting pictures of life in German Africa, is better done. *Klaus Hinrich Baas* (1909) is a realistic novel of money worship, while *Der Untergang der Anna Hollmann* (1911) is a pessimistic sea tale of sustained interest with some of the characteristics of the fate tragedy. It is not the equal of *Jorn Uhl*. He wrote also the drama *Sonke Erichsen* (1912). Consult Lowenberg, *Frenssen, von der Sandgräfin bis zum Jorn Uhl* (1903).

FRENTA'NI. A people in central Italy, on the east coast, in the early ages, descended from the Samnites. They dwelt in a hilly region on the shores of the Adriatic Sea, and their chief town was Histunon (see VASTO). Consult Conway, *Italic Dialects* (2 vols., Cambridge, 1897).

FRENZEL, frēnts'el, KARL WILHELM (1827-1913). A German journalist and novelist, born and educated in Berlin. In 1861 he became dramatic and literary critic of the *National-Zeitung* of Berlin. His works include many historical novels depicting eighteenth-century French life and later German life, e.g., *Frau Venus* (2 vols., 1880), *Schönheit* (1887), and *Wahrheit* (1889). Several of these are well known, such as *Charlotte Corday* (1864), *Watteau* (1864), *La Pucelle* (1871), *Lucifer, ein Roman aus der Napoleonschen Zeit* (1873). His *Berliner Dramaturgie* (reprinted 1882) is a valuable contribution to the history of the modern German drama.

FRÉPPEL, frē-pēl', CHARLES EMILE (1827-91). A French prelate and historian. He was born at Obernai, Lower Alsace, studied at Strassburg, and, after being ordained a priest, taught there. In 1870 he became Bishop of Angers. He was a champion of the doctrine of the infallibility of the Pope, and defended it before the Ecumenical Council at the Vatican. After the Franco-German War he publicly counseled the restoration of the monarchy, and on numerous occasions, more particularly during the controversy between Bismarck and the Vatican, he revealed his anti-German tendencies. The Catholic University at Angers was founded by him in 1875. He was, after 1881, a leader of the Clericals in the French Chamber of Deputies. His 30-odd volumes on Church history and kindred subjects include *Les pères apostoliques et leur époque* (3d ed., 1870), *Les apologistes chrétiens au IIe siècle* (3d ed., 1887), *Examen critique de la vie de Jésus-Christ par M. Renan* (15th ed., 1866), a violent polemic, *St Irénée* (1861), *Tertullien* (1863), *Origène* (1867). His complete works were published in 10 volumes (1880-88). Consult the biographies by Cornut (Paris, 1893) and Charpentier (Angers, 1904).

FRÈRE, frâr. A family of French painters. CHARLES THÉODORE (1815-88), the eldest, genre and landscape painter, was born in Paris. He was a pupil of Cogniet and Roquellan, and made

his first exhibit in 1834. Two years later he went to Algeria, traversed the desert, visited the East, and was present at the fall of Constantine, in October, 1837. In 1869 he accompanied the Empress Eugénie in her voyage up the Nile, making a sketchbook of aquarelles at her request. His favorite subjects for pictures were scenes from Eastern life, but he occasionally produced military pieces. Although much prized in their day, his pictures are distinctly inferior to the best Orientalist art. Among the best of them are a series of scenes in Constantine (1840-48), a "Bazaar in Damascus," a "Harem in Cairo," "Festival in Constantinople," "Ruins of Karnak," "Caravan of Mecca." The Metropolitan Museum, New York, possesses "Cairo, Evening," "View of Jerusalem," "Departure from Jerusalem for Jaffa." He received medals in 1848 and in 1865. He died in Paris, March 25, 1888. — **PIERRE EDOUARD** (1819-86). A genre painter, brother of the preceding. He was born in Paris, Jan. 10, 1819, and studied under Paul Delaroche and in the Ecole des Beaux-Arts. He exhibited his first picture in the Salon of 1843. At the close of the Exposition of 1855 he was decorated with the cross of the Legion of Honor. He was one of the most sane and wholesome of French genre painters, and his portrayal of humble household scenes and child life are marked by true sentiment. He possessed also a fine sense of color. His pictures are well known through reproductions. Among the best are the "Little Goumand," "Curiosity," "Repose," "The Little Cook," "First Steps," "The Library," "Going to School." There are six of his pictures in the Walters Gallery, Baltimore, and one in the Metropolitan Museum, New York. Frère died at Anvers-sur-Oise, May, 1886. — **CHARLES EDOUARD** (1837-94). A genre, landscape, and portrait painter, son and pupil of Théodore. He also studied under Couture. He received a first-class medal in 1865. Among his paintings are the "Muleteer in the Alps" (1865), "The Basket-Sellers," "Before the Rain" (1875), "The Surgical Operation" (1884).

FRÈRE, frër, SIR HENRY BARTLE EDWARD, familiarly known as **SIR BARTLE FRÈRE** (1815-84). A British diplomat and administrator. He was born at Clydach, Brecknockshire, March 29, 1815, and after education at Bath Grammar School went to Haileybury College to prepare for the Indian Civil Service, which he entered in 1834, and in 1835 he was appointed assistant revenue commissioner at Poona. His judicious treatment of native agriculturists led to beneficial results and to his advancement. In 1842 he became secretary to Sir George Arthur, Governor of Bombay, in 1846 proceeded to Sindh as British Resident, and in 1850 was appointed Chief Commissioner. In 1859 he was created K C B in recognition of valuable services during the Indian Mutiny, for which he twice received the thanks of Parliament. From 1862-67 he was Governor of Bombay. On his return to England he was created G C S I and nominated member of the Indian Council in London. In 1872 he went as special commissioner to East Africa and induced the Sultan of Zanzibar to sign a treaty abolishing the slave trade. In 1875 he was chosen to accompany the Prince of Wales to Egypt and India. He was Governor of Cape Colony 1877-80, and as High Commissioner for British South Africa was deputed to arrange the confederation of the South African colonies, which was frustrated by the Kaffir and Zulu

wars and trouble with the Boers. He was recalled and lived in retirement at Wimbledon until his death, March 29, 1884. He was several times president of the Royal Asiatic Society, and in 1872-73 was president of the Royal Geographical Society. His writings, consisting of letters, speeches, etc., include a *Memoir of the Right Hon John Hookham Frere*, prefixed to the latter's works (1871-74), *Pandurang Hari, or Memoir of a Hindoo, Eastern Africa as a Field for Christian Labor* (1874). Consult Martineau, *Life and Correspondence of Sir Bartle Frere* (London, 1895).

FRÈRE, JOHN HOOKHAM (1769-1846). An English diplomat and author. He was born in London, and in 1785 went from a Putney preparatory school to Eton. He proceeded to Caius College, Cambridge, graduated B A, 1792, M A in 1795, and was elected a fellow. He entered the Foreign Office under Lord Grenville, and from 1796 to 1802 represented West Looe, Cornwall, in Parliament. As a contributor to the *Anti-Jacobin* he supported Canning's defense of Pitt's administration, and in 1799 was made Undersecretary of State. He was appointed Envoy to Lisbon in 1800, and twice went as Minister to Spain in 1802 and 1808. His counsel, resulting in Sir John Moore's disastrous retreat to Corunna, caused his recall. He afterward refused an ambassadorship at St Petersburg, and he twice declined the offer of a peerage. Owing to his wife's ill health, he retired to Malta and devoted himself to literature and languages. His mock-heroic poem, *Prospectus and Specimen of an Intended National Work by William and Robert Whistlecraft, of Stow-Market in Suffolk, Harness and Collar Makers, intended to comprise the most interesting particulars relating to King Arthur and his Round Table* (1817), furnished the model for Byron's *Beppo* and *Don Juan*. Frere's fame rests on his translations of Aristophanes, *The Acharnians*, *The Knights*, *The Birds*, and *The Frogs*, which were privately printed, and only made public in 1847 by Sir G. Cornwall Lewis in *The Classical Museum*. Consult *Memoir and Works of the Right Hon John Hookham Frere*, by W E and Sir Bartle Frere (London, 1874), and Festing, *J H Frere and his Friends* (ib., 1899).

FRÈRE-ORBAN, frâr' ôrban', HUBERT JOSEPH WALTHER (1812-96). A Belgian statesman. He was born at Liège, received his education at home and in Paris, and began the practice of law in his native town. He identified himself with the Liberal party, and was conspicuous in the controversy with the Catholic clergy. In 1847 he was elected to the Belgian Chamber and appointed Minister of Public Works, and from 1848 till 1852 he held the portfolio of Finance. He founded the national bank of Belgium, reduced postage, and was a strong advocate of free trade. His work, *La main-morte et la charité* (1854-57), directed against the Conservatives, produced a great effect on the position of parties in Belgium. As a result, in 1857 the Liberals returned to power and Frère-Orban became once more Minister of Finance in the cabinet of Rogier, whom he succeeded as Prime Minister in 1868. In 1870 the Catholics regained their supremacy and forced him to retire, but from 1878 to 1884 he was again at the head of the cabinet. Subsequently he led the Opposition in Parliament till 1894, when he lost his seat, over the suffrage extension question. He was a successful financier

and a believer in the doctrine of free trade His liberalism consisted in the assertion of the authority of the state over the church and the defense of the system of secular public instruction against the clergy He was at all times opposed to the undue extension of the suffrage Among other works he wrote *Le question monétaire* (1874)

FRERICHS, frä'riks, FRIEDRICH THEODOR VON (1819-85) A German physician, born at Aurich and educated at Göttingen and Berlin After holding a professorship at Kiel and conducting the clinical institute and hospital in that city, he was for eight years professor of pathology and therapy at Breslau (1851-59), whence he was called to Berlin in 1859, where he became permanently established He was considered one of the leading medical authorities in the German capital, and as physician on the general medical staff of the Prussian army rendered particularly valuable services during the Franco-German War His principal work is the *Klinik der Leberkrankheiten* (2d ed, 1861, Eng trans, 1860, under the title *A Clinical Treatise on the Diseases of the Liver*, also translated into French and Italian)

FRÉRON, frä'rôn', ELIE CATHERINE (1719-76) A French critic and controversialist A brilliant pupil of the Jesuits, he was made professor at the Collège Louis-le-Grand at the age of 20, and on leaving the Jesuits (1739) was engaged for 35 years as contributor to literary journals, in which he carried on a relentless war with Voltaire in particular and against the encyclopedic movement in general, on account of its antireligious doctrines His work is not without cleverness and good literary judgment, but is best remembered for the retorts it evoked from Voltaire, notably *Le pauvre diable*, *L'Ecosseuse* and *L'Âne littéraire* (The Literary Donkey), the title of which parodied that of Fréron's journal *L'Année Littéraire* (1754-76) and reminds one of Pope's famous *Dunciad* Fréron wrote also histories of *Mary Stuart* (1742) and of *Germany* (1771), as well as negligible verses He died in Paris, March 10, 1776 Consult Nisard, *Les ennemis de Voltaire* (Paris, 1853), Monselet, *Fréron* (ib, 1864); J Trévedy, *Notes sur Fréron et ses cousins Royon* (ib, 1902)

FRÉRON, LOUIS MARIE STANISLAS (1754-1802) A French journalist and legislator, son of the preceding, born in Paris He was educated at the Collège Louis-le-Grand and was a schoolmate of Robespierre He first came prominently before the public as editor of the *Année Littéraire* In 1790 he founded the revolutionary journal *L'Orateur du Peuple* He was elected a deputy to the Convention in 1792, was a follower of Danton, and after persecuting the Royalists with great cruelty, contributed to the downfall of Robespierre and attacked the Terrorists, finally entering into negotiations with the Monarchist faction He was an unsuccessful suitor of Pauline Bonaparte, and in 1799 was made subprefect of Haiti, where he died soon afterward from the effects of the climate His *Mémoire historique sur la réaction royale et sur les massacres du Midi* (1796) defends his conduct at Toulon in 1793, as commissioner of the army of Italy Consult Arnaud, *Le fils de Fréron* (Paris, 1909).

FRES/CO (It, cool, fresh), or **FRESCO PAINTING** The term properly applied to

the process as well as to the painting executed upon plaster while it is still wet or fresh hence the Italian name *al fresco* It is also improperly used for painting executed directly on the surface of a wall, such as *tempera* (qv), also called *distempera*, which is the process in which water colors mixed with egg or some glutinous substance are used The method of true fresco painting is as follows A wall, either of brick or stone (better than laths) and perfectly dry, is plastered with lime and water (hydrate of lime), which has been prepared and allowed to stand for at least a year Before using it is mixed with sand, and while the water is in process of being expelled by the carbonic acid in the lime, the pigments must be applied in order that the protective covering of carbonate of lime may form over them The first and coarser coats, called *arriccio*, may be applied over the entire wall about half an inch thick and with a roughened surface, the two finer finishing coats, called *intonaco*, are applied only on whatever portion of the surface can be painted in a day This surface is then covered by the corresponding portion of the artist's cartoon, of the same size as the finished fresco is to be This cartoon is executed usually in black and white and quite sketchily, though the artist often has for further assistance a smaller sized colored sketch for use in the details and color scheme The impression of the cartoon is left on the plaster either by pouncing or by indenting the outlines with a pointed implement of wood or bone, and the cartoon being then removed, the painter proceeds to apply the colors, these are mostly earths or minerals, as few others will stand the action of lime, and they are ground and applied with pure water The coloring is necessarily thin, transparent, and light, though since the late Renaissance the more liberal use of *impasto* has lessened these qualities, giving greater opacity When the day's work is finished the artist cuts away any of the plaster that he has not painted on, beveling it at the very edge of his finished work, and the next day the plasterer joins closely another portion of plaster to the edge of the portion painted on the previous day The lime, in drying, throws out a kind of crystal surface, which protects the color and imparts a degree of clearness much superior to, and easily distinguishable from, that of a work in *tempera* or size paint This process, although apparently simple, nevertheless requires great dexterity and certainty of hand; for the surface of the plaster is delicate and must not be overworked, besides, the lime only imbibes a certain quantity of additional moisture in the form of liquid colors, after which it loses its crystallizing quality and the surface, or a portion of it, becomes what painters call rotten Many frescoes are defective in this way It is only after the lime has dried that such flaws are discovered, the proper plan in such a case is to cut away the defective portion, have fresh plaster laid on, and do the work over again But the flaws are too often retouched with *tempera* or size colors, and though they may escape notice for a time, the parts touched will change or come off in the course of a few years All retouching must, of course, be done *a secco* on the dry plaster and must be sparingly used Another difficulty in fresco is that the colors become much lighter after the plaster dries, and for this allowance must be made However, by practice the painter

may soon get over this difficulty and he can test the difference between the color as wet and as dry by putting a touch on a piece of umber he has generally at hand which instantly dries the color and shows it as it will be when the lime has dried. *Fresco secco* is a spurious kind of fresco, ordinarily used only in house decorations. The colors are the same, but they are laid on after the plaster is dry. Before the work begins the dry plaster is rubbed with pumice stone to remove the crust, and then washed with water mixed with a little lime. The effect is coarse, dry, and common, and the thin protecting crust is inadequate to preserve the painting.

The preeminence claimed for fresco painting is founded on (1) clearness and purity of color, (2) a dead surface as far removed from the dullness of tempera as from the gloss of oils and so capable of being viewed from all points, (3) durability under all conditions, (4) cheapness of process, (5) necessity for quick work, precluding the frittering of artistic energy on unessentials. On the other hand, it labors under the disadvantage of the fragility of the plaster, the lack of depth and richness, and the necessity of more or less retouching by another process (*a secco*).

History Fresco painting seems to have been known to the Egyptians, and it was certainly practiced by the Greeks and after them by the Romans, but the only surviving examples were found in Herculaneum and Pompeii. It occurs also in the catacombs of Rome and Naples, but was neglected in the Middle Ages. The peculiar construction of the Italian Gothic, with its flat wall surfaces, offered a splendid opportunity for fresco painting on a grand scale. The church of St. Francis of Assisi, which became a museum of fresco painting of the thirteenth and fourteenth centuries, led the way, and soon, particularly through the influence of Giotto, the greatest development of the art that the world has ever seen began in Italy. In the fifteenth century it flourished especially in Florence in the works of Massaccio, Ghirlandajo, and others, whose achievements paved the way for its supreme achievement in Michelangelo's ceiling of the Sistine Chapel and Raphael's Stanze in the Vatican. In northern Italy it flourished at Padua in the fifteenth century, at Milan, and especially at Parma in the cupola decorations of Correggio, perhaps the consummate master of the technique, but whose exaggerations of movement contributed to the extravagances of the baroque (seventeenth century). Fresco painting was very widely practiced in the eighteenth century, but degenerated into superficial decoration, and only charms by its gay lightness in the works of such masters as Tiepolo and certain French rococo painters. In the early nineteenth century it was practically rediscovered by the German Nazarenes (see *Pre-Raphaelites*) at Rome, and an important development in Germany was made possible by the commissions of Louis I of Bavaria, who caused churches, palaces, and museums of Munich to be decorated in this medium, chiefly after the designs of Overbeck. Its practice continued in Germany, and it was also introduced into England in the decorations of the Houses of Parliament, but its use has of late diminished, giving place to oil and encaustic painting (q.v.).

Bibliography. The process of fresco, as practiced by the early Italians, is described in the

well-known work of the contemporary painter Cennino Cennini. Its development is also treated in the paragraph *History* of the general article *PAINTING*. Modern treatises on the subject are those of Taylor, *A Manual of Fresco and Encaustic Painting* (London, 1847), von Seidlitz, "Ueber Frescotechnik," in *Kunst für alle*, vol. xv (Munich, 1900), Ward, *Fresco Painting, its Art and Technique* (London, 1909).

FRESCOBALDI, frēs'kō-bal'de, GIROLAMO (1583-1644). A celebrated Italian organist and composer, born at Ferrara. Very little of his earlier life and training is known, although he had published a collection of five-part madrigals as early as 1607. He appears to have studied with Luzzaschi in his native place, afterward taking up his residence in Belgium. Returning to Italy, he lived first in Milan and later on in Rome, where some time about 1614 he obtained the position of organist at St. Peter's. By this time he had acquired wide fame as an organ virtuoso, as many as 30,000 people, it is recorded, having gone to hear his first performance at St. Peter's. With the exception of one short interval (1628-33), during which period he held the appointment of court organist at Florence, he retained his position at Rome. He is regarded by many historians and musical authorities as the greatest organist of the first half of the seventeenth century, while as a composer he is scarcely less famous. In the latter capacity he is credited with anticipating the modern key system and the introduction of advanced ideas in fugal form and musical notation. Frescobaldi's music is the highest type of early seventeenth-century music and displays the consummate art of the early Italian school. His vocal compositions include canzones, motets, hymns, and the collection of madrigals already noted. Consult F. X. Haberl, *Frescobaldi* (Leipzig, 1887).

FRESENIUS, frē-zī'nē-us, KARL REMIGIUS (1818-97). An eminent German analytical chemist. He studied at Bonn and at Gießen and was assistant to Liebig. In 1845 he became professor of chemistry and allied sciences at the Agricultural Institute of Wiesbaden. Fresenius carried out numerous important investigations in analytical chemistry and did much towards systematizing this art by the publication of excellent works. His exhaustive standard treatises, well known to every student of chemistry, have passed through many editions in German and have been translated into several languages. They include *Anleitung zur qualitativen chemischen Analyse*, first published in 1841, and *Anleitung zur quantitativen chemischen Analyse* (1845). In 1862 he founded the *Zeitschrift für analytische Chemie*. See *ANALYSIS, CHEMICAL*.

FRESENIUS, REMIGIUS HEINRICH (1847-) A German chemist, born in Wiesbaden, son of the chemist, Karl Remigius Fresenius. He studied at the universities of Berlin and Leipzig (under Kolbe), in 1872 became docent in the Wiesbaden chemical laboratory, in 1881 head of the agricultural experiment station there, and in 1897 director of the Fresenius Chemical Laboratory, and was editor of the *Zeitschrift für analytische Chemie* (in 1882-97 with his father, after 1897 with his brother Wilhelm and E. Hintz). He wrote valuable monographs on many European mineral springs.

FRESH-AIR WORK. A form of charity which consists in taking poor children from the slums of great cities into the country or to the

seashore for recreation. The first authenticated case of charity of this kind was in 1849, when Rev William A Muhlenburg a pastor in New York City, sent poor and sick people from his parish into the country for short vacations. In 1872 the New York *Times* inaugurated a system of free excursions, and its example was followed in other parts of the country. The first general fresh-air societies were organized in 1874. Since that time the number of such societies has greatly increased. In 1914 they numbered nearly 100. General agencies, church organizations, and private funds provide for between 2,500,000 and 3,000,000 days' outing for poor children of the cities. The beneficiaries are for the most part children from 6 to 12 years old, though some of them are infants. A few adult women usually accompany them. They are sent away from the city for periods varying from a few hours to a fortnight spent in the so-called country "homes," or as the guests or boarders of private families. As a rule, the parents of the children are not required to bear any of the cost. In London, on the other hand, parents often pay as much as a third or more of the expense.

On the continent of Europe, *Switzerland* was the first country to develop this form of charity. The Rev W Bion, of Zurich, established the first of the vacation colonies in 1876. Provision had been made for poor children previously, but it was not until that year that the work was systematized and brought into close relation with the public schools. The colonies are usually situated in the mountains. Comfortable lodgings and wholesome food are furnished free of charge. Part of the expense is borne by the state and by municipal governments. The organization of fresh-air charity in *Germany* was contemporaneous with its organization in *Switzerland*. The first children's sanatoriums were organized in Kolberg and Rothenfelde in 1874. Two years later the first children were sent to vacation colonies. The plan soon gained favor throughout Germany, most of the important cities make provision through public and private agencies for vacations in colonies for considerable numbers of the children of the poor. In addition, large numbers of children are given excursions lasting a day. Those who are sent to a distance, to seaside or health resorts, are usually accompanied by a teacher. It is also common in Germany and Denmark for the artisan classes in the city and country to make a temporary exchange of children during a part of the summer. In *France* fresh-air charities are less developed than in any other important European country, but they are gradually rising in importance. Paris, Lyons, Bordeaux, Lille, Toulouse, Nancy, Besançon, and other cities have established colonies.

Vacation colonies have also been established in Spain, Italy, Austria-Hungary, Belgium, Russia, and in Argentina. The system in Europe is superior to the system in the United States in two respects—there is marked cooperation of fresh-air agencies in Europe by means of conferences and exchange of reports. The most important recent development of fresh-air work is the founding of seaside and country homes for children suffering from surgical tuberculosis. Experiments with open-air treatment for children of the cities suffering from nonpulmonary tuberculosis have been conducted in European countries for several decades, the first being at

Calais, where a hospital was founded for this purpose in 1861. In America the first systematic experiment was conducted at Sea Breeze, near New York City, in 1904, and it was demonstrated that a few months in the sea air would cure children who otherwise would be hopelessly crippled. Since that time an active propaganda for this form of fresh-air work has been carried on by the New York Association for Improving the Condition of the Poor, and elsewhere. Consult Ufford, *Fresh Air Charity in the United States* (New York, 1897), German, "Vacation Colonies in Switzerland," in *Consular Reports*, vol. lii, No 193, Comte, "Les colonies de vacances," in *Revue philanthropique* (Paris, 1898), Allen, "The Sea Air Treatment for New York's Bedridden Children," in *Review of Reviews*, vol. xxxii (New York, 1905), Delperier, *Les colonies de vacances* (Paris, 1908).

FRESHFIELD, DOUGLAS WILLIAM (1845–) An English geographer and mountaineer. He was educated at Eton and at University College, Oxford, became a member of the Alpine Club in 1864 (president, 1893–95) and edited the *Alpine Journal* in 1872–80, and prominently identified himself with the Royal Geographical Society (president, 1914), the Geographical Section of the British Association (president, 1904), and the Association of Geographical Teachers. He traveled and climbed mountains in many parts of the world, being the first to make ascents in the Caucasus (Elbruz and Kasbek, 1868, later, Gulba, Tetnuld, 1887, Laila, 1889). In 1899 he visited the Sikkim Himalayas and in 1905 the base of Ruwenzori (Equatorial Africa). Much interested in historical problems relating to the Alps, especially as to the pass utilized by Hannibal, he published *Hannibal Once More* (1914). His other writings include *Travels in Central Caucasus and Bashan* (1869), *Italian Alps* (1875), *Exploration of the Caucasus* (1896, 2d ed, 1902), *Round Kangchenjunga* (1903).

FRESH-WATER MARSH HEN See **RAIL**.
FRESH-WATER MUSSEL Any of the great many species of *Umo* or *Anodon*—bivalve or pelecypod mollusks of rivers and ponds, especially abundant in North America. See **MUSSEL**.

FRESNEL, frā'nēl', AUGUSTIN JEAN (1788–1827) A French physicist. He was born at Broglie and was educated at Caen at the Ecole Polytechnique and at the Ecole des Ponts et Chaussées. On the completion of his studies he was sent as government engineer to the Department of Vendée, and afterward to the Department of Drôme, where he remained till 1814. He lost his position on the return of Napoleon from Elba, because he, as a Royalist, had offered his services to the Bourbons. After the Second Restoration he returned to Paris, where he resumed his duties as government engineer. In the interval he devoted his enforced leisure with great success to physicomathematical researches, investigating in particular the polarization of light. In ignorance of the work of Thomas Young (qv), Fresnel demonstrated to his countrymen the error of the Newtonian theory of the propagation of light (qv) by the emission of material particles and so ably advocated the undulatory hypothesis that Arago, who was a member of a commission appointed to consider the paper containing the new theory, became an enthusiastic convert to his ideas. Fres-

nel's crowning experiment, which demonstrated the truth of the theory, was with the two mirrors inclined at an angle of nearly 180°, so that the incident beams were reflected to the same point, and alternate light and dark bands or fringes were seen. This was not caused by diffraction, as the beams were reflected from the surface of the mirrors. Having convinced himself that light was due to wave motion, he further advanced the theory that these waves in the ether were *transverse*, i.e., that the displacements in the ether were perpendicular to the direction of propagation of the waves. No contribution to the theory of light is more important. With Arago he investigated the action of polarized light, and their discoveries, published in a joint memoir, confirmed the new theory of the mode of the propagation of light. His theory of the explanation of double refraction by biaxial crystals, involving a most complicated wave surface, has stood the test of modern work. He elaborated a theory of reflection and refraction and deduced formulæ which observations have proved to be correct, even though his theory was defective. Mention should also be made of his theory of the aberration of light and its resulting formulæ. His practical application of scientific optics to the improvement of lighthouse illumination was of incalculable value, and he served for several years as a member of the lighthouse commission. Consult Robert Moon, *Fresnel and his Followers* (Cambridge, Eng., 1849), and D. F. Arago *Biographies of Distinguished Scientific Men*, vol. 11 (Boston, 1859). See LIGHTHOUSE.

FRESNILLO, frás-nél'yō. A town in the State of Zacatecas, Mexico, 36 miles by rail northwest of the city of Zacatecas, on the Mexican Central Railway (Map Mexico, H 6). It is situated at an elevation of nearly 6900 feet and is well built and laid out with broad, straight streets. Stock raising is carried on in this region, but the town derives its chief importance from the rich silver and copper mines of the Cerro del Proaño, discovered in 1554. There are other mineral deposits. Pop (est), 6500.

FRESNO, fréz'nō. A city and the county seat of Fresno Co., Cal., 209 miles southeast of San Francisco, on the Southern Pacific and the Atchison, Topeka, and Santa Fe railroads (Map California, F 6). It is situated in the centre of the San Joaquin valley and has many attractive buildings, among which are the Federal building, erected at a cost of \$250,000, Carnegie library, city hall, and courthouse. Places of interest in the vicinity are King's River Cañon, Roeding Park, and Kearney Park, an irrigated experimental farm owned by the University of California. The city is the centre of an agricultural and stock-raising district, has important petroleum interests, and extensively exports raisins, wines and brandies, grapes, oranges, olives, and other fruits, shipping more than 12,000 carloads annually, besides wheat, sheep, and horses. The chief industrial establishments are fruit-packing plants, a cooperage, icing plants, planing and flour mills, an oil refinery, macaroni factories, a brewery, wagon works, etc. Under a charter of 1901 the government is vested in a mayor, elected every four years, a municipal council, and administrative officials, all of whom are appointed by the mayor with the consent of the council, excepting the city clerk, police judge, and school directors, chosen by popular

vote. Settled in 1872, Fresno became the county seat in 1874 and was chartered as a city in 1885. Pop., 1900, 12,470, 1910, 24,892, 1914 (U. S. est.), 28,809, 1920, 44,616.

FRET (probably from OF *frete*, iron band, ferrule, syncopated from It. *ML ferrata*, iron grating, from *ferrare*, to bind with iron, from Lat. *ferrum*, iron). A charge in heraldry (qv).

FRÉTEAU DE SAINT-JUST, frâ'tō' de sâ'n-zhust', EMMANUEL MARIE MICHEL PHILIPPE (1745-94). A French politician, born in Paris. In 1787 he was imprisoned in the castle of Doullens for his opposition to the King, but returned to his seat in Parliament a year later. He was a deputy to the States-General and was one of the first of his rank to join the Third Estate. He became a member of the Constitutional Committee, then Secretary and twice President of the Assembly. In 1790 he introduced a resolution that only the Assembly, acting on the King's initiative, had the right to make war, demanded that the title of Archbishop should be done away with and voted for the suppression of all titles of nobility, and near the end of the year was elected judge in Paris. In 1792 he resigned from the presidency of the First Arrondissement and retired to his home at Vaux-le-Pénil. Two years afterward he was arrested on the charge of joining two priests in an antirevolutionary plot. He was acquitted, but was kept in prison, and two months later was tried and executed for favoring the schemes of Capet and for complicity with Thouret and Le Chapelier.

FRETUM GALLICUM. See BONIFACIO.

FRETUM HERCULEUM. See GIBRALTAR.

FRETUM MAMERTINUM. See MESSINA, STRAIT OF.

FRETUM SICILIÆ, frê'tûm sî-sîl'i-ë, or **FRETUM SICILIEN'SE**. One of the ancient names of the strait between Italy and Sicily. See MESSINA, STRAIT OF.

FREUD, froit, SIGMUND (1856-) An Austrian physician and psychopathologist. He was born in Freiburg, Moravia, May 6, 1856. After graduating in medicine from the University of Vienna, he was, in turn, demonstrator in the physiological institute, assistant physician in the general hospital, and lecturer on nervous diseases. In 1885 he went to Paris, where for a year he was a pupil of Charcot. In 1902 he was made associate professor of neuropathology in the University of Vienna. He visited America in 1909 and received the honorary degree of LL.D. from Clark University. His most important works are: *Zur Auffassung der Aphasie* (1891), *Studien ueber Hysterie*, with J. Breuer (1895, 2d ed., 1908, Eng. trans. by Jelliffe and White, 1913), *Traumdeutung* (1900, 3d ed., 1911, trans. by Brill, *Interpretation of Dreams*, 1913), *Ueber den Traum* (1901, 2d ed., 1911), *Psychopathologie des Alltagslebens* (1904, 4th ed., 1912, Eng. trans., 1914), *Der Witz und seine Beziehung zum Unbewussten* (1905; 2d ed., 1912), *Drei Abhandlungen zur Sexualtheorie* (1905, 2d ed., 1910, trans. by Brill, *Three Contributions to the Sexual Theory*, 1910), *Sammlung kleiner Schriften zur Neurosenlehre* (1906, 2d ed., 1911), *Zweite Folge* (1909, 3d ed., 1913), *Ueber Psychoanalyse* (1910, 2d ed., 1912), *Totem und Tabu* (1913). He also became editor of *Jahrbuch für psychoanalytische und psychopathologische Forschungen*, *Internationale Zeitschrift für ärztliche Psychoanalyse*,

Imago, and *Schriften zur angewandten Seelenkunde*

Freud's principal contributions to science have been a new method for the analysis and treatment of hysteria (psychoanalysis) and a comprehensive theory of dreams (See DREAMING). He believes that most cases of hysteria are the indirect result of a nervous shock, emotional and usually sexual in nature. The ideas involved are, for various reasons, suppressed or inhibited until at length they are forgotten, i.e., cannot voluntarily be recalled. They find expression, however, in the hysterical state. The method of psychoanalysis, which is highly technical, consists in the employment of the patient's free associations as an aid to the subsequent recall of the forgotten or submerged group of ideas. When this end is accomplished, the patient is believed to be on the highroad to recovery, since the ideas, once suppressed, are now brought into connection with normal associations and the cause of the hysteria is removed. Consult Freud, *Selected Papers on Hysteria*, trans by Brill (New York, 1909), Hart, "Freud's Conception of Hysteria," in *Brain* (London, 1911), *Zentralblatt für Psychoanalyse* (Wiesbaden, 1911), Brill, *Psychoanalysis* (New York, 1913), Hitschmann, *Freuds Neurosenlehre* (Vienna, 1911), Putnam, in *Journal of Abnormal Psychology*, iv (Boston, 1909), Jones, in *Psychotherapeutics* (ib., 1909). Jelliffe and White of New York founded in 1911 an American Psychoanalytic Association and in 1913 the *Psychoanalytic Review*.

FREUND, FRIEDRICH, WILHELM (1806-94). A German classical scholar, born of Jewish parents at Kempen, Posen. He was educated at Berlin, Breslau, and Halle, and taught at Breslau (1828-29), at Hirschberg (1848-51), and at Gleiwitz (1855-70). After 1870 he worked at Breslau. His great work is the *Wörterbuch der lateinischen Sprache* (1834-45), based on the great lexicon of Forcellini (qv). He wrote also *Gesamtwörterbuch der lateinischen Sprache* (1844-45) and the *Lateinisch-deutsches und deutsch-lateinisch-griechisches Schulwörterbuch* (1848-55). The Latin-English dictionaries by Andrews, Smith, Lewis and Short, and Riddle and White are all based upon his work. Only a little less important than his lexicographical work was the valuable *Wie studirt man Philologie?* (6th ed., by Deiter, Stuttgart, 1903). He also wrote *Tafeln der Literaturgeschichte* (1877), *Triennium Philologicum* (3d ed., 1906 et seq.), a long series of *Präparationen zu den griechischen und römischen Klassikern*, beginning in 1859, *Wanderungen auf klassischem Boden* (1889-92).

FREY, FRÉY, or FREYR (Icel., lord). The son of Njord, of the dynasty of the Vanagods. He was adopted with his father among the Æsir, who, when he got his first tooth, bestowed upon him the celestial castle Alfheim. He is the god of peace and fruitfulness, but particularly of light; dispenses rain and fertility, and to him prayers for a good harvest are addressed. He wakens the earth from the sleep of winter. His wife is Gerda, daughter of the giant Gymer. Frey had seen her as he once ascended the lofty seat of Odin, Hlidskjalf, from which everything on earth is seen. Gerda was so beautiful that the brightness of her arms illuminated air and sea. Seized with love, Frey sent Skirnir as spokesman, and for his services had to give him his sword, which he will miss in the final contest or eclipse of the gods. His magic ship

Skidbladnir, which could be folded up like a cloth, represents the clouds that dissolve at the rays of the sun. Like Freyja, he was the patron of marriage, and probably the two were at one time conceived as united hermaphroditically. Frey was held in great veneration, especially in Sweden, of which he was patron god, in Norway, and from there also in Iceland. His chief temple was at Upsala, where a bloody offering was yearly made to him of men and animals. His festival was at the winter solstice, and while the god was borne round the land all strife was laid aside. Oaths were often sworn in his name, and he was called on to avenge wrongs. He is even called the god of the world and the prince of gods. Both Njord and Frey are very much like Nerthus, described by Tacitus in the *Germania* as *terra mater*, possibly through a confusion of gender the feminine Nerthus became the masculine Njord. Consult Paul, *Grundriss der germanischen Philologie*, iii (Strassburg, 1900).

FREY, FRI, EMIL (1838-1922). A Swiss statesman. He was born at Arlesheim and, after studying at Jena, came to the United States, where during the Civil War he fought with distinction in the Union army, was taken prisoner at Gettysburg, and was not released until 1865. He was advanced to the rank of major. In 1865 he returned to Switzerland. In the Nationalrat he was a leader of the Left in 1872-82 and President in 1875-76. He was editor of the *Baseler Nachrichten* from 1872 to 1882, when he was appointed Minister Plenipotentiary to the United States. Returning in 1888, he was in 1893 elected President of the Swiss Confederation. He became an active promoter of educational reform and an advocate of international legislation for the regulation of factory service. He worked for the construction of the St Gotthard Tunnel and of other avenues of intercourse, the modification of the forestry laws, the extension of the fortification system, and the improvement of the army. In 1897 he was made director of the International Telegraph Bureau at Bern. In 1906 he was president of the first Conference for International Protection of Workingmen.

FREY, FRIEDRICH HERMANN. See GREIF, MARTIN.

FREY, HEINRICH (1822-90). A German anatomist and zoologist. He was born at Frankfurt on the Main and studied medicine at Bonn, Berlin, and Göttingen. In 1848 he was appointed professor of comparative anatomy and histology at Zurich, and professor of zoology at the Polytechnic Institute in that city. Most of his works are devoted to histology and microscopy and are considered among the best productions on those departments of science. Especially important are the following *Histologie und Histochemie des Menschen* (5th ed., 1876; Eng. trans. by A. E. J. Barker, 1874); *Das Mikroskop und die mikroskopische Technik* (8th ed., 1886; Eng. trans. by G. R. Cutter, 1874), *Grundzüge der Histologie* (3d ed., 1885). He was especially skillful in researches in the subject of microlepidoptera, which topic he discusses in the works entitled *Die Tineen und Pterophoren der Schweiz* (1856) and *Lepidopteren der Schweiz* (1880).

FREY, JAKOB (1824-73). A German-Swiss editor and novelist, who wrote but little, but that of rare quality. He was born at Guteschwyl, Canton of Aargau, studied at the universities of Tübingen, Munich, and Zurich, was

editor of a paper at Aarau and afterward at Bern, and, having for some years lived at Basel, settled in 1868 at Aarau, where he died. His collection of tales, *Zwischen Jura und Alpen* (1858), the novel *Die Waise von Holligen* (1863), and the three volumes of *Schweizerbilder* (1864 and 1877), are all works of distinction and artistic genius, worthy to rank with the works of Jeremias Gotthelf and Gottfried Keller. Consult A. Frey, *Jakob Frey, Lebensbild* (Aarau, 1897).

FREY, JOSEPH SAMUEL CHRISTIAN FREDERICK (1773-1850). An American clergyman, born at Mainstockheim (Bavaria), Germany. As a Jew, he was instructed in Hebrew theology, and in 1794 became a reader in the Synagogue, but in 1798 he turned Protestant Christian and in 1800-07 was a missionary of the London Missionary Society among Hebrews in the United Kingdom. In 1816 he came to the United States, in 1818 founded and was appointed pastor of the Mulberry Street Congregational Church, New York City, and in 1820 established the American Society for Ameliorating the Condition of the Jews, which worked among Hebrew immigrants. He left the Congregational church to join the Baptists in 1827 and, after having occupied several pastorates in the Baptist denomination, resigned and in 1837-40 labored with little success in Europe as a representative of the American Society for the Conversion of the Jews. In 1840 he returned to the United States, and later he settled at Pontiac, Mich., where he was instructor in Hebrew in the preparatory department of the University of Michigan. His publications include *A Narrative of my Life* (1809), *Judah and Israel* (1837), *A Hebrew and English Dictionary* (1839), a *Hebrew Grammar*, which passed through many editions, *Joseph and Benjamin A Series of Letters on the Controversy between Jews and Christians* (2 vols., 1842).

FREYCINET, frâ'sé'nâ', CHARLES LOUIS DE SAULCES DE (1828-1923). A French statesman and engineer. He was born at Foix, in the Department of Ariège, and was educated at the Ecole Polytechnique in Paris. In 1856 he was appointed *chef d'exploitation* of the Railway Company of the South. From 1856 to 1861 Freycinet undertook several journeys in the employ of the government and published as a result of his observations an admirable work on city sanitation and another on child labor in England. After the fall of the Empire Gambetta appointed Freycinet Prefect of the Department of Tarn-et-Garonne, and in October, 1870, he was associated with Gambetta as "personal delegate of the Minister of War." In this capacity Freycinet displayed remarkable energy and ability, particularly in the rapid organization of the military railway and telegraph service, and the furnishing of the staff with strategic maps. He retired after the armistice and published *La guerre en province pendant le siège de Paris* (1872), which was a defense of his administration. He was elected to the Senate in 1876, was appointed Minister of Public Works in 1877, and was intrusted with the formation of a cabinet by President Grévy, in 1879, assuming the portfolio of Foreign Affairs. Not being in accord with Gambetta, he resigned the premiership in 1880, but on the resignation of Gambetta in 1882, Freycinet formed a new cabinet, which resigned a few months later, upon being refused a vote of credit for the protection

of the Suez Canal. It was through this that France lost all her influence in Egypt. In 1885, on the downfall of the Ferry cabinet, he was summoned by President Grévy to form a new ministry, but not succeeding in harmonizing the conflicting elements, he entered the cabinet formed under Henri Brisson as Foreign Minister. He formed a new cabinet in January, 1886, but was forced to resign in December. He was Minister of War from 1888 to 1893, being also Premier from 1890 to 1892. He went out of office, together with the rest of the cabinet, in January, 1893, as a result of the investigations into the Panama affair. From November, 1898, to May, 1899, Freycinet was once more Minister of War in the Dupuy cabinet. In 1887 he was elected a member of the Academy of Sciences and in 1890 a member of the French Academy. He has written a number of works on engineering and mathematics, among others *Traité de mécanique rationnelle* (1858) and *De l'analyse infinitésimale* (1860), also *Essais sur la philosophie des sciences* (1895), and *La Question d'Égypte* (1905). In 1914 two volumes of his *Mémoires* had appeared.

FREYCINET, LOUIS CLAUDE DESAULCES DE (1779-1842). A French naval officer and navigator. He was born at Montélimar in the Department of Drôme, Aug. 7, 1779. Joining the navy in 1793, in 1795 he took part in several engagements against the English and Spanish. In 1800 he joined, with his brother Louis Henri, who afterward rose to the rank of admiral, the expedition sent out under Captain Baudin in the *Naturaliste* and *Géographe* to explore the south and southwest coasts of Australia. Much of the ground already explored by Flinders was revisited and renamed. In 1805 Freycinet returned to Paris and was given an appointment in the Department of Marine Maps and Charts, in order to make maps of the territory the expedition had covered. In 1817 he commanded the *Urame*, in which Arago and others went to Rio de Janeiro to take a series of pendulum measurements. This was part of a larger scheme for obtaining observations, not only in geography and ethnology, but in astronomy, terrestrial magnetism, and meteorology, and for the collection of specimens in natural history. For three years Freycinet cruised about, visiting Australia, the Marianne, Hawaiian, and other Pacific islands, and South America, returning to France, notwithstanding the loss of the *Urame*, with fine collections in all departments of natural history. He published several scientific memoirs and two accounts of his travels: *Voyages de découverte aux terres australes pendant les années 1800-04* (2d ed., 1824-25) and *Voyage autour du monde entrepris par ordre du roi* (13 vols., 1824-44). He was one of the founders of the Geographical Society of Paris.

FREYJA, frëy'ya (Icel, lady, fem. of *Frey*), and **FRIGGA** (woman, wife). Two goddesses in northern mythology. Frigga, the older, is found among nearly all Germanic peoples, while Freyja is a later creation of the Icelandic. Frigga, in the genealogy of the *Æsir* (qv), is the supreme goddess, wife of Odin, and presides over marriages. Freyja is the daughter of Njord, sister of Frey, and goddess of love. She is drawn on a car yoked with cats, to her deceased women go and also the half of all men that fall in battle, whence she is called Val-Freyja. In this last respect she must be considered as signifying the earth, but the earth is

also represented by Frigga, the wife of Odin, and when Freyja seeks Odin, Odin symbolizes the sun. The names "Frigga" and "Freyja" are in signification almost alike, and the two are often confounded in mythology. The Anglo-Saxons and Lombards worshiped the wife of Odin as Frea. The name yet survives, probably, in *Friday*. Consult Mortensen, *Handbook of Norse Mythology* (New York, 1913), and Craigie, *Icelandic Sagas* (ib., 1913).

FREYLINGHAUSEN, frī'ling-hou'zen, JOHANN ANASTASIUS (1670-1739). A German pietistic theologian and religious poet, born at Gandersheim. He studied theology at Jena and in 1695 went as Francke's assistant to Halle, where he later became chief pastor and director of the Pedagogical Institute. His *Compendium der christlichen Lehre* was translated into English by J. Planta in 1804 under the title *An Abstract of the Whole Doctrine of the Christian Religion*. His *Grundlegung der Theologie* (14th ed., 1744) was also very popular in its day. It is chiefly, however, as a writer and editor of hymns that Freylinghausen is known, among his principal publications of this kind being the collection *Geistreiches Gesangbuch* (1714), containing 683 hymns, and *Neues geistreiches Gesangbuch*, containing 798 hymns. These hymns obtained a wide popularity in the Protestant church service and have been frequently republished. Freylinghausen is said also to have been an excellent musician.

FREYR. See **FREY**.

FREYTAG, frī'tag, GEORG WILHELM FRIEDRICH (1788-1861). A distinguished German Orientalist, born at Luneburg. He studied theology and Oriental philology at Göttingen and from 1811 to 1813 acted as tutor there. In 1813 he became public librarian at Königsberg, and in 1815 chaplain in the Prussian army, in which capacity he visited Paris, and remained there after peace was proclaimed in order to continue the study of Persian, Turkish, and Arabic under the famous De Sacy. In 1819 he was appointed to the professorship of Oriental languages in the recently established University of Bonn, and this post he held until his death. He edited and translated into Latin two volumes of Arabic songs, *Hamasæ Carmina* (1828-52), and edited three volumes of Arabic proverbs, *Arabum Proverbia* (1838-43). He also published a Hebrew grammar and a treatise on Arabic versification. His greatest work, however, was his *Lexicon Arabico-Latinum* (4 vols, 1830-37, abridged ed., 1837).

FREYTAG, GUSTAV (1816-95). A German novelist, dramatist, and critic of distinction. He was born at Kreuzburg, Upper Silesia, July 13, 1816, studied at Breslau and Berlin, lectured on German literature as privatdocent at the University of Breslau, and after a brief residence in Dresden went to Leipzig to become editor of *Die Grenzboten* (1848-70). During this period he had published, together with other dramas of minor interest, *Die Journalisten* (1853), still often acted, one of the very few modern German comedies that can be ranked with Lessing's (qv) *Münna von Barnhelm*, the admirable novel *Soll und Haben* (1855, translated into nearly all European languages), dealing with the inevitable conflict between the spirit of caste and privilege, rooted in the feudal past of Germany, and the new industrial and democratic spirit of the age; a novel of less merit, *Die verlorene Handschrift* (1864), a valuable

contribution to the theory of dramatic criticism, *Die Technik des Dramas* (1863), indifferently translated into English by McEwen (Chicago, 1894), and the most popular historical essays of his generation, *Bilder aus der deutschen Vergangenheit* (4 vols, 1859-62). From 1867 to 1870 Freytag represented Erfurt in the North German Reichstag, and during the French war he was for a time attached to the staff of the Crown Prince. A journal of these days, *Der Kronprinz und die deutsche Kaiserkrone*, published in 1889, one of Freytag's few weak productions, revealed, in a way unwelcome to the court, the liberal tendencies of the deceased Frederick III and supplemented the brief autobiographic *Erinnerungen aus meinem Leben* that had accompanied Freytag's collected *Works* (22 vols, 1887-88). In his novels he was influenced by Scott and Dickens. His great work after 1870 was the series of historical novels *Die Ahnen* (1872-80), a monument to the continuity of German character through all the ages of its history and already a classic in its literature. To this national task Freytag gave eight of his maturest years, and he brought to it the preparation of long historic investigations. The stories reach back in *Ingo und Ingraban* to the twilight of German history and bring the reader to the Christian conversion, show in a second volume, *Das Nest der Zaunkönige*, the growing dominance of the Roman church, in a third, *Die Brüder vom deutschen Hause*, the struggles of the Teutonic Knights, and in a fourth, *Markus König*, the Reformation and the founding of the Prussian state. The fifth, *Die Geschwister*, deals with the Thirty Years' War, and the last, *Aus einer kleinen Stadt*, with the revival of national life after the humiliations of the Napoleonic conquest. They are, however, marked rather by historical learning and a thorough insight into German character than by great artistic merit. While these novels were appearing, Freytag wrote much for a weekly, *Im neuen Reich*, but in 1879, *Die Ahnen* finished, he withdrew from active life and lived chiefly at Wiesbaden, where he died, April 30, 1895. His complete works were published in 22 volumes (1887-88). For his biography, consult Alberti (Leipzig, 1885), Seiler (ib., 1898), Enich Schmidt, "Dem Andenken Gustav Freytags," in *Deutsche Rundschau*, xxi (Berlin, 1895); E. Elster, "Gustav Freytag," in *Biographisches Blätter*, ed. by Bettelheim, vol. II (Berlin, 1896).

FRIANT, frī'an', LOUIS, COUNT (1758-1829). A French general, born at Villers-Morlancourt, Somme. After participating in the wars of the French Revolution he accompanied Napoleon as brigadier general to Egypt in 1798 and was appointed Governor of Upper Egypt by Kléber. He fought with distinction at Heliopolis (March 20, 1800) and Cairo and was appointed general of division, but after a futile defense of Alexandria was compelled to surrender to the allied armies of England and Turkey (August, 1801). The title of Count was conferred on him at the coronation of Napoleon. He participated in nearly all the great battles of the Napoleonic wars, from Austerlitz to Waterloo, particularly distinguishing himself at Borodino. Consult the *Vie militaire* (Paris, 1857), by his son, Gen. Jean François Friant.

FRIAR (OF *frere, frere*, Fr. *frère*, Sp. *fray, fraile*, It. *frate*, from Lat. *frater*, brother). A generic name applied to the members of cer-

tain comparatively modern religious communities in the Roman Catholic church, in contradistinction to the older title of monk, which designated especially the Benedictines and their branches. Friar belongs to the members of the four great orders—Franciscan, Dominican, Carmelite, and Augustinian, and of the lesser orders. These orders, unlike those of the monks, are devoted primarily to service in some form, and their vow of poverty originally applied to the order, as well as the individual, so that they must beg their food and became known as mendicant orders. Their founders, from motives of humility, chose the simple title of brother to designate their followers. St Francis called his *fratres minores*, friars minor (lesser brothers), while St Dominic gave his order the name of *fratres prædicatores* (preaching friars). The popular names of these orders were derived from the color or other distinguishing mark of their habit—such as gray friars (Franciscans), black friars (Dominicans), white friars (Carmelites), crutched friars (Canons Regular of the Holy Cross), and Austin friars (Augustinians). See MONASTICISM.

FRIAR BACON A popular title for Roger Bacon. It is employed in a play by Robert Greene, entitled *The Honorable History of Friar Bacon, and Friar Bungay*, printed by Edward White in quarto (1594). A prose work, first printed in 1627, was reprinted in Thoms's *Early English Prose Romances* (Pickering, London, 1828), under the title of *The History of Friar Bacon*.

FRIAR BIRD (so called from its bare head, the ruff of feathers about its head, and its sober plumage). A well-known Australian honey eater (*Philemon*, or *Tropidorhynchus corniculatus*). It also has other names, as "Pimlico" and "Four o'clock," imitative of its loud cry. Several closely related forms inhabit the Malayan islands to the north of Australia. All are dull drab in color, have the head and neck more or less bare of feathers, and the culmen of the large curved bill furnished with an excrescence. They inhabit the tree tops, go in small flocks, and are strong, bold, noisy birds. An interesting circumstance connected with them is the fact that in each island where a local species exists there also exists an oriole which "mimics" its appearance perfectly (see MIMICRY) and thereby escapes much harm from enemies that might easily overcome it did they not mistake it for the more powerful friar bird. Consult Wallace, *Darwinism* (London, 1889).

FRIAR BUNGAY See BUNGAY, FRIAR.

FRIAR RUSH See RUSH, FRIAR.

FRIAR'S BALSAM The popular name for compound tincture of benzoin, of the United States Pharmacopœia, it is also applied to a similar preparation, *Balsamum traumaticum*. Friar's balsam is used as a dressing for wounds and ulcers, being stimulating and antiseptic. See BENZOIN.

FRIAR'S TALE, THE In Chaucer's *Canterbury Tales*, the tale told by the friar Hubert.

FRIAS, fré'as, Tomás (1805-84). A Bolivian statesman, born at Potosí. He was Secretary of State under several presidents, and after the assassination of Morales, in 1872, he was selected to conduct the affairs of the government as acting President. He was elected Vice President in 1873, and upon the death of President Ballivian succeeded to the presidency (Feb. 14, 1874). His administration was pro-

gressive and undisturbed. Two years after the completion of his term of office (1877) he was sent as Minister to France. He was one of the foremost of South American statesmen.

FRIBOURG, fré'bōor', or FREIBURG, fri'-burk A canton in the western part of Switzerland (Map Switzerland, B 2). It has an area of 646 square miles. The southeastern part is high and may be said to belong to the Bernese Oberland region, the northwestern part belongs to the basin of Lake Neuchâtel. The main rivers are the Saane and the Brove. The mountain forests furnish wood for export, limestone, gypsum, and pitch coal are found. Of the total area 88 per cent is productive. Grain, fruit, potatoes, tobacco, and grapes are grown. Dairy products, especially cheese, are exported. Fribourg produces a fine grade of draft horses and gives its name to an excellent breed of black cattle. Its manufactures are not important. They include watches, paper, tobacco and cigars, glass, and products of the loom. Straw plaiting and tanning are leading industries. The canton is administered by a Grand Council, elected by the people. It sends seven representatives to the National Council. Pop., 1900, 127,628, 1910, 139,200. The inhabitants are mostly Roman Catholics. French is the official language, although legislative measures are published also in German. The canton is on the line separating the German and French speaking population of Switzerland. The educational institutions comprise the university at the capital, Fribourg (qv), a seminary, a college, and many secondary, elementary, and industrial schools. The ancient dwellers of the land were the Celtic Helvetii. During the great barbaric migrations the district was occupied by the Alemanni in the east and the Burgundians in the west. In the sixth century it came into the possession of the Franks. It passed under the control of the Holy Roman Empire in 1032. The inhabitants refused to allow the spread of Protestantism within their borders. In 1798 the French occupied the land, and it remained under French influence till 1814. The canton, which has always been ultramontane and conservative, is the only one without the referendum and with restricted popular rights. Consult Berchtold, *Histoire du canton de Fribourg* (Freiburg, 1841-45), and Marrot, *Chronique du canton de Fribourg* (ib., 1878).

FRIBOURG, or FREIBURG The capital of a canton of the same name, Switzerland, situated on the Saane, 19 miles southwest of Bern, on the main line of railway between Berne and Lausanne (Map Switzerland, B 2). The town stands on a promontory, is ancient, and is irregularly built, with many walls and towers. The river is crossed by a number of fine bridges, including two of the suspension type, of which the larger, built in 1832, is 808 feet long. The most notable buildings are the church of St Michael, formerly belonging to the Jesuits, and the town hall, with its Gothic clock tower. Among the educational institutions are the university (founded in 1889), the College of St Michael, and the lyceum, containing the cantonal museum. A dam 590 feet long across the Saane immediately above the town supplies about 4000 horse power. The chief manufactures of the town are tobacco, pasteboard, leather, and artistic objects. Pop., 1900, 15,794, 1910, 20,394.

FRIC, or FRITSCH, frich, ANTON JOHANN

(1832-1914) A Bohemian geologist and zoologist, brother of Joseph Václav Frič, born and educated at Prague. He became professor in the Czech University at Prague (1863) and was also director of the zoological and palaeontological department of the Museum of Bohemia. Among his writings are *Les oiseaux d'Europe* (1832), *Naturgeschichte der Vogel Europas* (1853-71), *Cephalopoden der böhmischen Kreideformation* (1872), *Geologische Bilder aus der Vorzeit Böhmens* (1873), *Die Reptilien und Fische der böhmischen Kreideformation* (1878), *Fauna der Gaskohle und der Kalksteine der Permformation Böhmens* (4 vols, 1879-99), *Fischereikarte des Königreichs Böhmen* (1888), *Der Elbelachs* (1894).

FRÍČ, JOSEPH VÁCLAV (1829-90) A Bohemian poet, born in Prague. Because he took active part in the risings of 1848-49 he was punished by imprisonment and exile. He went to London in 1859, then to Paris and to Berlin, and in 1879 returned to Prague. His literary productions, which do not rise above mediocrity, include *Pláč koruny české* (The Wail of the Czech Crown, 1866), contributions to the Czech periodicals *Blaník* and *Correspondance tchèque* and to the *Agramer Zeitung* (1870-77), the historical work, with Léger, *La Bohême historique, pittoresque, et littéraire* (1868), the dramas *Svatopluk*, *Ulryk Hvitte*, and *Mazepa*, an almanac, *Lada Nola* (1885), and lyric poems in a Byronic manner, of which *Upír* (The Vampire, 1849) is the best example. His collected works, *Sebrané spisy*, were published at Prague (1879-80), and his *Memoirs* appeared in four volumes (Prague, 1885-87). He frequently used the pseudonym "Brodský."

FRICK, HENRY CLAY (1849-1919) An American manufacturer and capitalist, born at West Overton, Pa. At the age of 19 he became bookkeeper in a flouring mill at Broad Ford, in the centre of the Connelville territory. He early took an interest in the possibilities of the coking industry, then in its infancy, and in 1871 organized the firm of Frick and Company with 300 acres of coal lands and 50 ovens—one-eighth of the total number in the Connelville region. In the panic of 1873 the coking industry suffered severely. Frick had the sagacity to acquire the properties of his hard-pressed competitors, as well as the interests of his partners, thus laying the foundation for his later control of the industry. By 1889 he controlled 35,000 acres of coal lands and 15,000 ovens, representing two-thirds of the capacity of the region. This control of the fuel supply placed him in a position to enter into an alliance, on extremely favorable terms, with the rising Carnegie steel firm. In 1889 he became chairman of the board of managers of that company and was thereafter one of the chief influences in its development and during the year 1892 became director of several important corporations. During the Homestead strike of 1892 an attempt on his life was made by Alexander Berkman, the anarchist. In 1897 he was made chairman of the board of directors of the H. C. Frick Coke Company, which was soon the largest coke-producing company in the world. In 1905 he was head of a committee appointed to draw up a plan of reform in connection with the management of the Equitable Life Insurance Company.

FRICTION (Lat. *frictio*, a rubbing, from *fricare*, to rub). If a solid body with a flat surface rests on a horizontal table, it requires a

definite force to start it moving, and if it is set in motion, it will come to rest unless acted upon by a sufficient force. These phenomena are said to be due to the force of "friction" between the two surfaces. It is found by experiment that the force required to start the motion of one body over the other varies directly as the force pressing the surfaces together, but is independent of the area of contact. The ratio of the force required to produce motion to the force pressing the surfaces together is called the "coefficient of static friction." It varies largely for different kinds of material and is always diminished by lubricants.

Similarly, if one body is caused to slide over the other, a definite force is required to prevent its motion being retarded, in other words, a force is required to maintain a uniform speed. This force bears a definite ratio to the force pressing the surfaces together, which is called the "coefficient of kinetic friction" and is independent of the area of contact. This coefficient is different for different materials and for the same substances is less than "the coefficient of static friction." It is independent, further, within certain limits of the degree of speed. Some values of this coefficient of kinetic friction are as follows, oak on oak, fibres parallel, 0.48, the same, with surfaces rubbed with dry soap, 0.16, iron on oak, fibres parallel to motion, 0.62, iron on iron, surfaces well lubricated, 0.04.

The resistance noticed when a wheel rolls on a plane surface with no slipping is not a true case of friction, although it is sometimes called "rolling friction." It is due to the plane surface becoming deformed and rolled up in front of the advancing wheel or to the wheel itself flattening out. This opposition is, however, in most cases extremely small, when compared with sliding friction. Whenever work is done in overcoming friction, the surfaces which are rubbed over each other experience heat effects, and thus friction always causes loss of available mechanical energy. On the other hand, without friction most motions would be impossible—e.g., a man walking, a belt driving a pulley, a train moving on a track, etc. If there were no friction, all these motions would necessarily be produced by cog-wheels or their equivalents.

Friction between solids is due to slight unevennesses on the surfaces in contact and is therefore what may be called a force between the minute portions of the bodies, and heat effects are produced. The exact mechanical explanation is not evident. In the case, however, of friction between moving layers of liquids or gases, it is. It is known that all molecules of these forms of matter are moving about at random through distances which are considerable with respect to their own size, if, then, a layer of fluid is moving relatively with reference to a contiguous layer—e.g., the currents produced in a tumbler of water by stirring a spoon in it, or the currents of air produced by whistling—molecules move freely from one layer into the other. The effect is exactly that of having two long trains of cars, or movable platforms, on parallel tracks—one train in motion, the other not; if enough people step back and forward from one train to the other, the moving one will be slowed up, the one at rest will be set in motion, and finally both trains will be moving at the same speed. If one train is kept at rest, the other will be brought to rest also. Thus, moving layers of liquids and gases are brought to rest,

The kinetic energy of the currents goes into increasing that of the molecules, and the temperature is raised. Friction between layers of fluids is sometimes called "viscosity," and a fluid is said to be "viscous" if this frictional force is large.

There is thought to be little, if any, friction between a fluid and a solid, when, e.g., the fluid is flowing through a pipe or tube in case the fluid "wets" the solid, in general there is a layer of the fluid close against the solid and attached to it, so that any friction is between this layer and the rest of the fluid.

Still another case of friction is to be considered—that between portions of a solid body when it is making elastic vibrations, e.g., a vibrating tuning fork. When any solid is deformed, there is always to a greater or less degree a slipping of layers of the solid over each other, and thus there is produced "internal" friction. Owing to this, the energy of vibration of the body decreases, the vibrations cease, and the body as a whole has its temperature raised. Consult Thurston, *Treatise on Friction and Lost Work in Machinery and Millwork* (7th ed., New York, 1903), Davis, *Friction and Lubrication* (2d ed., Pittsburgh, 1904), Löffler, *Mechanische Triebwerk und Bremsen* (Munich, 1912).

FRIDA, frē'da, EMIL BOHUSCH (1853-1912). A leading Czech poet and dramatist, whose pen name was Jaroslav Vrchlický. He was born at Laun, Bohemia, was educated at Prague, and was appointed professor of literary history in the Czech University there in 1893. In 1901 he was called to the Austrian House of Peers. For his talent and versatility Frida has been compared to Victor Hugo. His poetic works comprise epics, tragedies, comedies, several novels, and translations from the best writers of France and Italy. Many selections from his works have been translated into German. In English appeared his one-act play, "At the Chasm," in *Poet Lore*, vol. xxiv (1913).

FRIDAY (AS *frjgedæg*, *Frigdæg*, OHG. *Frīatag*, Ger. *Freitag*, from AS *Frige*, OHG. *Fria*, Icel. *Frig*, a goddess partly identified with the Roman Venus + AS *dæg*, Ger. *Tag*, day, a German translation of the Latin name *dies Veneris*, day of Venus, whence It. *venerdì*, Fr. *vendredi*, Friday). The sixth day of the week. Among the Germanic peoples it was sacred to the goddess named above, the wife of Odin. In the Christian Church it was in very early times consecrated to the commemoration of the crucifixion of Christ, which took place on that day. (See GOOD FRIDAY.) The superstition that Friday is an unlucky day may probably be traced to association with this event. Clement of Alexandria, Epiphanius, and other early writers show that it was already marked by fasting and prayer. In the Roman Catholic church it has always and everywhere been a day of abstinence from flesh meat, except when Christmas falls on a Friday. The Anglican churches also designate all Fridays (with the same exception) as days of fasting or abstinence. Since the spread of the devotion to the Sacred Heart of Jesus in the last two centuries, the first Friday of every month has been a day marked for devout Roman Catholics by special observances in honor of it. Among the Mohammedans it is the day for religious gatherings, said to have been chosen by Mohammed in memory of the creation of man, as well as to differentiate his followers from Jews and Chris-

tians. They are not required to rest from labor except during the time of the Friday midday prayer, at which all adult males are required to be present.

FRIDAY. In Defoe's *Robinson Crusoe*, a savage whom Robinson Crusoe saved from death on Friday, and who became his faithful servant.

FRIDAY CLUB, THE. A social club, started by Sir Walter Scott, in June, 1803. It met at Fortune's Tavern and was probably modeled on Johnson's famous club at the Turk's Head. A list of the members is given in Lockhart's *Life of Scott*, vol. II (Edinburgh, 1850).

FRIDERICIA, frē'dā-rē'sē-a, JULIUS ALBERT (1849-) A Danish historian. He was born and educated at Copenhagen and was appointed assistant librarian at the university library in that city in 1891 and professor of history in 1899. Many of his works are based upon a careful study of the archives of Denmark, Sweden, Holland, England, Germany, France, and other European countries. His principal works comprise *Danmarks ydre politiske Historie i Tiden fra Freden i Lybek til freden i Bromsebro*, 1629-60 (1876-82), and *Adelsvaldens sidste Dage, Danmarks Historie fra Christian IV's Død til Enevældens Indførelse* (1894), *Revolutionen og Napoleon I 1789-1815* (1903). With Brucka he published *Christian IV's egenhændige Breve* (1878-91).

FRIDIGERN. See FRITIGERN.

FRIDOLIN, frē'dō'lān', or **FRIDOLD**, frē'dōlt (less frequently TRIDOLIN, or TRUDELIN), SAINT. A Christian missionary of the sixth century, called "the First Apostle to Allemannia." All that is known of him was written four centuries later by Balther, a monk, whose biography of the saint contains a great amount of legend intermingled with historical fact. He was an Irishman, who, after labors among his heathen country folk, went to Portiers, where he restored the church of St. Hilary, much impaired through Arian heresy, to its former prosperity. He afterward founded a church and a monastery on the island of Sackingen in the Rhine. He is the patron saint of the Canton of Glarus, Switzerland, on whose coat of arms he appears. His day is March 6. An edition of Balther's *Life* is contained in Mone's *Quellensammlung der badischen Landesgeschichte*, vol. I (Karlsruhe, 1845). Consult also Heber, *Die vorarolinguischen Glaubenshelden* (Göttingen, 1867), and Heer, *Sankt Fridolin, der Apostel Alemanniens* (Zürich, 1888).

FRIED, frēt, ALFRED HERMANN (1864-1921). A German publicist and advocate of international peace. He was born in Vienna, but about 1883 settled in Berlin, where he was first a bookseller and then an author. Having devoted himself to the peace movement in 1891, he founded the German Peace Society in 1892 and became editor of the *Friedenswarte* (founded 1899). In 1911 he received part of the Nobel award for peace. Among his many published works are *Friedenskatechismus* (1895), *Tagebuch eines zum Tode Verurteilten* (1898, in English, 1899), *Lasten des bewaffneten Friedens und des Zukunftskrieg* (1902), *Handbuch der Friedensbewegung* (1905, 2d ed., 1911); *Die moderne Friedensbewegung* (1906), *Pan-Amerika* (1910); *Der Iranke Krieg* (1910), *Der Kaiser und der Weltfrieden* (1910, Eng. version, 1912).

FRIED, OSKAR (1871-) A German composer and conductor, born in Berlin, Aug.

10, 1871 Owing to adverse circumstances, he was obliged to pick up a scanty musical education as best he could, playing for many years in inferior orchestras. While a hornist in the opera orchestra of Frankfurt, he attracted the attention of Humperdinck, from whom he received the first systematic instruction in composition. In 1900 he returned to Berlin, where he completed a thorough course in counterpoint under Philip Scharwenka. As a composer, he scored his first great success in 1904 with *Das trunke Lied*, op 11, for soli, chorus, and orchestra, a work of real power, exhibiting at the same time masterly contrapuntal and canonic skill. In 1907 he became conductor of the *Steinscher Gesangverein* in Berlin, and in 1910 he organized a symphony orchestra for the purpose of producing the latest orchestral works. As a leader of both choral and orchestral forces, he soon became famous. His principal works are a prelude and double fugue for string orchestra, op 10, the great choral works with orchestra, *Verklarte Nacht*, op 9, *Das trunke Lied*, op 11, *Erntehed*, op 15, andante and scherzo for wind instruments and two harps, op 2, and very remarkable songs published as op 1, 3, 4, 5, 7, 8. Consult H. Leichtertritt, *Oskar Fried* (Leipzig, 1906), and P. Bekker, *Oskar Fried Sein Werden und Schaffen* (Berlin, 1907).

FRIEDBERG, frēt'bērk, EMIL ALBERT (1837-1910). A German canonist. He was born at Konitz, West Prussia, and was educated at Berlin and Heidelberg. After having been a member of the faculty at Berlin, Halle, and Freiburg, he was appointed professor at Leipzig in 1869. The new critical edition of the *Corpus Juris Canonici* (1879-81) was prepared by him, as was also the *Formelbuch des deutschen Handels-, Wechsel- und Seerechts* (3d ed., 1894). Alike in his collaboration in the Prussian church laws of 1872 and as an author, he showed himself a champion of state supremacy in ecclesiastical matters, and many of his works deal with this subject in its various bearings. Perhaps the best known of his numerous publications are the following: *Die Geschichte der Zivilehe* (2d ed., 1877), *Lehrbuch des katholischen und evangelischen Kirchenrechts* (5th ed., 1903), *Verfassungsgesetze der evangelisch-deutschen Landeskirchen* (1885 et seq.).

FRIEDEL, frē'del', CHARLES (1832-99). A French chemist and mineralogist, born at Strassburg. He was educated at the Protestant gymnasium and subsequently studied, under Pasteur, at the University of Strassburg. After spending a short time in his father's banking business he went to continue his studies in Paris, where he resided with his grandfather, the celebrated zoologist Duvernois. After a thorough preparation in the mathematical sciences he entered the laboratory of Wurtz, with whom he soon formed a close friendship. In 1869 he presented two remarkable theses, one in organic chemistry and one in mineralogy, which immediately attracted to him the attention of the scientific world. In 1871 he became instructor in mineralogy at the Ecole Normale Supérieure and in 1876 succeeded Delafosse as professor of mineralogy at the Sorbonne. Two years later he succeeded Regnault as member of the Institute. On the death of Wurtz, in 1884, Friedel was appointed professor of organic chemistry and director of the research laboratory at the Sorbonne, a position which he re-

tained to the end of his life. In 1892 he organized and became director of the Ecole de Chimie, a school of industrial chemistry connected with the University of Paris. Friedel's researches contributed extensively to the development of organic chemistry and synthetic mineralogy. The results embodied in his 254 original memoirs have, without a single exception, joined the structure of science as valuable and indisputably correct data. His classic researches on the ketones, his discovery of the secondary alcohols, his total synthesis of glycerin, his discoveries of many new mineral species and of methods of reproducing many minerals artificially, his discovery of the pyroelectric properties of minerals, his researches on the chemistry of silicon and its organic compounds, and his discovery, jointly with James Mason Crafts, of the synthetic method well known as "the Friedel and Crafts reaction," entitle him to a distinguished place among experimental scientists. The Friedel and Crafts reaction consists in the action of various chlorinated compounds on aromatic hydrocarbons in the presence of aluminum chloride, thousands of different organic compounds being thus conveniently prepared on any ordinary scale. As to the compounds of silicon, Friedel, working in conjunction, partly with Crafts, partly with Ladenburg, showed that the element silicon is, like carbon, quadrivalent, and obtained a series of compounds perfectly analogous to the hydrocarbons and capable of yielding many substances perfectly analogous to derivatives of the hydrocarbons. Friedel's book-form publications include a textbook of mineralogy and crystallography, and a work on organic chemistry, entitled *Cours de chimie organique professé à la faculté des sciences de Paris* (2 vols., 1887).

FRIEDELITE, frē-dē'līt. A crystalline mineral magnesium chlorosilicate discovered by Bertrand in the mines of Adervielle. It has a dark-red color and is translucent. It was named in honor of Charles Friedel (qv).

FRIEDENTHAL, frē'den-tal, KARL RUDOLF (1827-90). A German statesman. He was born at Breslau and was educated at Breslau, Heidelberg, and Berlin. He became a member of the North German Reichstag in 1867 and was one of the founders of the Free Conservative party. He was a member of the conference convened at Versailles during the Franco-German War to assist in framing the constitution of the new German Empire. In 1874-79 he was Minister of Agriculture and then became a member of the House of Lords. His influence upon the economic development of the German Empire was most important.

FRIEDENWALD, frē'den-wald, HERBERT (1870-) An American writer on historical subjects, born at Baltimore, Md. He graduated at Johns Hopkins University in 1890 and received his Ph.D. from the University of Pennsylvania in 1894. From 1897 to 1900 he was chief of the division of manuscripts of the Library of Congress. He edited the *American Jewish Year Book* in 1908-13, was secretary of the American Jewish Committee in 1906-13, and became recording secretary of the American Jewish Historical Society. His writings include *Material for the History of the Jews in the British West Indies* (1897), *Some Newspaper Advertisements of the 18th Century* (1897), *Historical Manuscripts in the Library of Congress* (1898), *A Calendar of Washington*

MSS in the Library of Congress (1901), The Declaration of Independence. An Interpretation and Analysis (1904)

FRIEDERICIA See **FREDERICIA**

FRIEDRIKE VON SESENHEIM, frē'dēr-ē'ke fōn sā'zen-him See **BRION**, **FRIEDRIKE ELISABETH**

FRIEDHEIM, frēt'hīm, **ARTHUR** (1859–) A distinguished German pianist, born in St Petersburg, of German parents. Although he appeared as a virtuoso when only nine years of age, he did not give his entire time to music, but completed the regular courses of the German gymnasium and university. In 1880–82 he studied with Liszt in Rome. After an activity of several years as conductor at various smaller theatres, he studied once more with Liszt in Weimar. His real career as a pianist began in the United States about 1890, but recognition came very slowly. Excess of temperament led him to hammer unmercifully, rendering his playing colorless. When he gradually gained in artistic moderation, the many excellent qualities of his playing appeared, chief among which is wonderful tone color. During his extensive tours in Europe he soon became famous as perhaps the greatest Liszt player, and as such he was acknowledged also in America when he returned in 1910. In 1908 he settled in Munich. As a composer, he became known through a concerto for piano and orchestra in B flat and an opera, *Die Tänzerin*, produced in Cologne in 1905.

FRIEDLAND, frēt'lant, *Eng* pron fiēd'land. A town of East Prussia, on the left bank of the Alle, 26 miles southeast of Königsberg (Map Germany, J 1). It is celebrated as the scene of one of Napoleon's most splendid victories, gained over the Russians under General Bennigsen, June 14, 1807. On June 10 the corps of Soult, Lannes, and Murat had delivered an attack on the Russian intrenchments at Heilsberg and had been repulsed with a loss of nearly 10,000 men. Napoleon thereupon swung his army to the north of Heilsberg and took up the march for Königsberg, hoping by this manoeuvre to entice the Russian commander from behind his fortifications. On the 11th Bennigsen abandoned Heilsberg, and for three days, till the 13th, the two armies were engaged in a race for the threatened town, the Russians advancing by the right bank of the Alle, the French to the left of the river and at some distance away. On June 13 the corps of Murat and Davout were in the neighborhood of Königsberg, Soult was at Kreutzburg, about 10 miles south of Königsberg, and Lannes was at Domnau, some 15 miles southeast of Kreutzburg. Napoleon, with the Guard and the corps of Victor, Ney, and Mortier, was at Preussisch-Eylau, about 5 miles from Domnau. Early in the morning of June 14 Bennigsen began the crossing of the Alle at Friedland, in the hope, probably, of surprising Lannes's isolated corps. Had the passage of the river and the attack on Lannes been carried out with rapidity and decision, victory would have certainly resulted for the Russians. But Bennigsen's dilatoriness and Lannes's intrepid resistance allowed time for Napoleon to arrive on the field of battle with the main body of troops and to turn the advantage of numbers in favor of the French, 70,000 against 55,000. The position of the Russians was perilous in the extreme, with the greater part of their forces hemmed in within a narrow arc of the Alle

curving behind them. In case of disaster then only means of retreat were the bridges across the Alle at Friedland. Against these bridges, as the key of the situation, Napoleon directed his attack. Mortier, on the left wing, was ordered to content himself with merely holding the enemy in check, while Ney, on the right, was sent against Friedland. The battle began about six o'clock in the afternoon. Ney advanced to the attack under cover of a heavy artillery fire, but his ranks were immediately thinned under a withering cannonade and were thrown back in utter confusion by a smashing charge of the Russian Household Cavalry. The corps of Victor and the division of General Dupont were thrown into the breach, while Senarmont with 30 guns took up a position 100 yards in front of the infantry line and drove back the Russian cavalry, gaining time for Ney to rally his division. A charge by Latour-Maubourg's dragoons and a further advance of Senarmont's batteries decided the fate of the battle. The Russians fled through Friedland pursued by Ney and Dupont, a part of the army with 120 guns reaching the right bank of the Alle before the bridges were burned. The Russian right, meanwhile, under Gortchakoff, had been skirmishing with Mortier, upon the retreat of Bennigsen, Gortchakoff attempted to retake Friedland, but, failing, was forced to move northward along the river in search of a fording place, losing one-third of his men in the passage of the river. The loss of the Russians in the battle was nearly 20,000 killed and wounded, the French loss was less than half that number. On June 19 Königsberg fell into the hands of the French, and on June 25 occurred the meeting between Napoleon and the Emperor Alexander at Tilsit (qv). Pop., 1910, 3029. Consult Johnston, *Napoleon A Short Biography* (New York, 1904).

FRIEDLAND, SAGAN AND MECKLENBURG, DUKE OF. See **WALLENSTEIN**

FRIEDLAND, VALENTIN (1490–1556). A German educator, generally called Trotzen-dorf, from the little village in Upper Lusatia where he was born, Feb. 14, 1490. He taught for a time in the school at Gorlitz, soon after obtaining his baccalaureate from the University of Leipzig, but, adopting the principles of Luther and Melancthon, he was obliged in 1518 to give up his instructorship. In 1523 he became rector of the gymnasium at Goldberg in Silesia for a brief period, he came a second time to Goldberg in 1531, in the same capacity, and remained for over 20 years, making the school so famous throughout Europe that it often had several hundred pupils at once. The school administration was modeled on that of the Roman Republic, thus affording a measure of self-government among the pupils, and Latin was the only language allowed in and out of school. The complete destruction of the buildings by fire in 1554 compelled a removal to Liegnitz, and here Friedland, while superintending the erection of new buildings at Goldberg, died, April 26, 1556. For his biography, consult Pinzger (Hirschberg, 1825) and Loschke (Breslau, 1856).

FRIEDLANDER, frēt'lēn-dēr, **DAVID** (1750–1834). A German Hebrew scholar. He was born in Königsberg, Prussia, and was attracted to Berlin by the reform movement under Mendelssohn. There he devoted himself to the emancipation of the Jews and labored assiduously to improve their condition. He was the

first Jewish member of the Berlin city council. He contributed to Mendelssohn's greatest biblical work, *Das Buch Kohleleth* (1772), and also published *Aktenstücke, die Reform der jüdischen Kolonie in den preussischen Staaten betreffend* (1793), *Sendschreiben an den Propst Teller von einigen Hausvater jüdischer Religion* (1799), *Ueber die Verbesserung der Israeliten im Königreich Polen* (1819).

FRIEDLANDER, (C GOTTFRIED) IMMANUEL (1871-) A German geologist, born in Berlin, and educated there, at the University of Kiel, and at the Zurich School of Technology. He traveled in North America, Hawaii, and Samoa in 1893-94, in the Canary Islands in 1896, in Madeira in 1897, in Mexico in 1906, in Fiji and Samoa in 1907, in Japan in 1908-09, and in the Cape Verde Islands in 1912. His interest was especially in volcanoes, and in 1910, at the International Geological Congress in Stockholm, he urged the establishment of a vulcanological institute at Naples, where he had lived since 1901, studying Vesuvius, and where in 1913 he built a private institute and established the *Zeitschrift für Vulkanologie*. His writings on volcanoes and precious stones (particularly the relationship of the genesis of diamonds, etc., to volcanic action) were published mostly in technical journals.

FRIEDLANDER, JULIUS (1813-84) A German numismatist. He was born in Berlin and was educated at Bonn and Berlin. During the last 30 years of his life he was director of the cabinet of coins in the Berlin Museum, which establishment was greatly enlarged under his management. He edited the *Aufsätze und Briefe* of G. Schadow (2d ed., 1890) and published works on the coins of the Knights of St. John (1843), the coins of Justinian (1843), and on those of the Ostrogoths (1844) and Vandals (1849), also a monograph entitled *Das königliche Münzkabinett* (with Sallet, 2d ed., 1877).

FRIEDLANDER, LUDWIG (1824-1909) A German classical scholar and archæologist, born at Königsberg. He was educated at the gymnasium of his native town and at the universities of Leipzig and Berlin. He became privat-docent at Königsberg in 1847 and full professor in 1858. In 1892 he retired and lived thereafter in Strassburg. Friedlander's studies were chiefly concerned with Roman archæology and the history of Homeric criticism. His most important works are *Die homerische Kritik von Wolf bis Grote* (1853), *Analecta Homérica* (1859), *Ueber den Kunstsinne der Römer in der Kaiserzeit* (1852), *Darstellungen aus der Sittengeschichte Roms*, etc. (8th ed., 1910), an edition of Martial (1886), an edition of the *Cena Trimalchionis* of Petronius (1895, 2d ed., 1906), and an edition of Juvenal (1895). His editions of Latin authors are especially strong on the side of antiquities, i.e., of Roman life and manners. His *Sittengeschichte* has been translated into English, as *Roman Life and Manners under the Early Empire* (4 vols., London, about 1910-13).

FRIEDLANDER, MAX (1852-) A prominent German musical scholar, born at Brieg (Silesia). He gave up a business career to study singing with Garcia in London and Stockhausen in Frankfurt. In 1880 he made his début as a concert singer (bass) in London. Soon his interest in the history of music

engrossed his attention, and when, after settling in Berlin in 1883, he met Spitta (qv), he was stimulated to begin original research. He abandoned his career as a singer and in 1887 received the degree of Ph.D. from the University of Rostock. In 1894 he became instructor in the science of music at the University of Berlin, in 1903 professor. While gathering materials for an exhaustive biography of Schubert, he discovered more than 100 lost songs of that master and many old folk songs, all of which he published. Among the most valuable of his writings are *Goethe's Gedichte in der Musik*, *Gedichte von Goethe in den Kompositionen seiner Zeitgenossen*, and *Das deutsche Lied im 18. Jahrhundert*. In 1912 he visited the United States on a lecturing tour.

FRIEDMANN, fréd'man, ALFRED (1845-1923) A German novelist and poet. He was born at Frankfort on the Main, was educated at Heidelberg and Zurich, and became established at Berlin in 1886. He became known alike as a poet and novelist, his poetic productions being characterized by a thorough mastery of form and diction. His works include *Die Feuerprobe der Liebe* (a humorous epic, 3d ed., 1879), *Angioletta*, two poems (3d ed., 1879), and the novel *Zwei Ehen* (3d ed., 1890). His more recent novels are entitled *Inez de Castro* (1898), *Tantalus* (1901), *Die letzte Hand* (1902), *Tantalus, Vorurteil, Vier Liebhaber der Marquise* (1905).

FRIEDMANN, MEIR BEN JEREMIAH (1831-1908) A Hungarian Jewish scholar, born at Kraszna, Hungary, and educated in the yeshibah at Ungvar and at the University of Vienna. He was a professor in the Hebrew Theological Seminary of Vienna, and coeditor of the *Bet Talmud* in 1881-86. He is known chiefly for his editions of the Midrashim texts, which include *Sifre* (1864), *Mekilta* (1870), *Pesikta Rabbati* (1880). He also published *Eshet Hayil* (1878), *Ha Zviyyon* (1882), *Sefer Shofetim* (1891), *Tanna debe Elyahu* (1900).

FRIEDREICH, fréd'rik, NIKOLAUS (1825-82) A German physician, born at Würzburg and educated in that city and at Heidelberg. In 1857 he was appointed professor of pathology in the University of Würzburg and director of the Anatomical Institute. From 1858 until his death he held the chair of pathology and therapeutics at Heidelberg and was clinical director there. In addition to "Die Krankheiten der Nasenhöhlen, des Larynx und der Trachea," in Virchow's *Handbuch der speciellen Pathologie* (1854), he published a valuable work on cardiac diseases, entitled *Die Krankheiten des Herzens* (2d ed., 1867).

FRIEDRICH, fréd'rik, JOHANNES (1836-1917) A German theologian and historian, prominent as a leader of the Old Catholics. He was born at Poxdorf, studied at the universities of Bamberg and Munich, was ordained a Catholic priest in 1859, and in 1865 became professor of theology in the University of Munich, and in 1867 a member of the Academy of Sciences. The most noticeable of his works is the *Kirchengeschichte Deutschlands* (1867-69). He was a pupil of Dollinger and in 1869 was called to the Vatican Council at Rome. His *Tagebuch während des Vatikanischen Konzils* geföhrt (1871) and *Documenta ad Illustrandum Concilium Vaticanum* (1871) are important sources of information concerning the proceedings. This council indorsed the papal infallibility dogma,

which Friedrich with Dollinger strongly opposed. Friedrich was consequently excommunicated in 1871, and in 1882 the Minister of Public Worship, yielding to Ultramontane pressure in the Chamber, transferred Friedrich from the chair of theology to that of history. He opened in 1874 the Old-Catholic theological faculty at the University of Bern and lectured there for a year. Among his works may be mentioned *Der Mechanismus der vatikanischen Religion* (1876), *Geschichte des Vatikanischen Konzils* (1877-87), *Beiträge zur Geschichte des Jesuitenordens* (1881), *Johann Adam Möller, der Symboliker* (1894), *Jacob Fritschhammer* (1896), *I von Dollinger* (1899-1901).

FRIEDRICH, JOHN (1858-) An American violin maker, born at Cassel, Germany. He was a pupil of Oswald Moockel, a prominent German violin maker and repairer, came to the United States in 1883, and in a short time ranked among the American leaders in his profession. In addition to violins he has made also bows, violas, and violoncellos of high quality. He received the highest award bestowed for violins, violas, and violoncellos at the World's Columbian Exposition, Chicago, 1893. He has also become known among collectors as an expert in the identification and valuation of rare instruments. Four of the choicest specimens of his violins are in the possession of Dr. Frank Waldo, of Cambridge, Mass.

FRIEDRICH, KASPAR DAVID (1774-1840) A German landscape painter. He was born at Greifswald, studied there under Rustoop and afterward at the academies of Copenhagen (under Eckersberg) and Dresden. He found subjects for his pictures in his wanderings on the Baltic coast, in the island of Rugen, and later among the Harz Mountains and the Riesengebirge, and became one of the principal exponents of Romanticism in painting. His true place in art was first revealed in the German Centenary Exhibition at Berlin in 1906. In 1817 he was made a member of and professor at the Dresden Academy. A series of drawings in sepia, depicting scenery in Rugen and other regions near the Baltic coast, is among his most highly prized works. Prominent among his oil paintings are "View in the Harz" and "Moonrise by the Sea" (1823) in the National Gallery, Berlin, "Repose during Hay Harvest" (1835), in the Dresden Museum, "The Grave of Arminius," in the Hamburg Gallery, "Pine Forest with the Raven," Castle Pulbus, Rugen.

FRIEDRICH, WOLDEMAR (1846-1910) A German historical painter and illustrator, born at Gnadau, Province of Saxony. He studied in Berlin under Steffek and in Weimar under Plockhorst, Ramberg, and Verlat, took part in the Franco-German War of 1870-71 and furnished the illustrations for Hiltl's work on the war. After a visit to Italy, in 1873, he returned to Weimar, where he was made professor at the School of Art in 1881. Called to Berlin in 1885 as instructor at the Academy, he was awarded the gold medal in 1886 for his allegorical ceiling-painting in the Exhibition Building. Among several other decorative works on a large scale are to be especially noticed "The Diet of Worms" (1892), in the Aula of the Gymnasium at Wittenberg, and the two mural paintings, "Art and Science" and "Book-Trade and Printing," in the Booksellers' Exchange at Leipzig. A series of landscapes and genre pictures in water colors and the illustrations to

his work *Sechs Monate in Indien* (1893) were the fruits of a journey to India. In 1889 he became a member of, and professor at, the Berlin Academy.

FRIEDRICHSDRUH, fîs'drîks-100 A village and railway station of Lauenburg, Prussia, 16 miles southeast of Hamburg by rail. Pop., 1900, 279. Its celebrity is derived from the proximity of the castle and estate of the Bismarck family, where Prince Bismarck (qv) died and is buried.

FRIENDLY ISLANDS See TONGA ISLANDS.

FRIENDLY SOCIETY The name given to English benefit associations established as a rule by the workmen themselves for certain forms of self-help, but now developed into mutual insurance societies. The origin of the friendly society is frequently ascribed to the mediæval guild. They began as sick clubs composed of small groups, usually neighbors, who met at the public houses, uniting conviviality with the payment of sick benefits and funeral expenses. The large orders arose from the renewed interest of the eighteenth century in Freemasonry. At first they had no regular benefit funds, but grants were made to members in distress. After 1834, when the Poor Laws were changed and the opportunities for thrift were better, societies increased rapidly. Since 1870 an effort has been made to put them on a stronger financial basis.

In general the benefits given by friendly societies are for sickness and funeral allowances. The question of superannuation funds is now important. Other forms of benefit sometimes found are endowments, insurance for shipwrecks, loss or damage to boats, nets, tools, or implements, medical aid dispensaries, widows' and orphans' funds, convalescent homes, asylums for the aged, and traveling relief for those out of employment. Formerly many local societies existed, but they are gradually disappearing. A frequent form was the dividing society, which shared the surplus at the end of the year. The strongly centralized societies have no social union, but only a business relationship with their members, as the dues are paid through agents or the post office.

The members are usually clerks, tradesmen, or highly paid artisans. There are two kinds of societies, not properly friendly societies: (1) deposit societies with savings-bank features, and (2) burial societies—some merely local clubs, others large societies with many abuses, in which the cost of the management is 40 to 55 per cent, and which appeal to the poorest classes. Many children are insured in them. There are funeral and local factory and shop clubs for particular trades—often compulsory and subsidized by employers. The large railroad and coal-mining societies provide principally for accidents. The most important friendly societies are the affiliated orders, including the temperance societies and containing the pick of English workmen and of the lower middle class. The orders are democratic social centres, thoroughly educational in character. Societies for women have not been very successful. The United Sisters' Friendly Society (1885), however, promises well. Juvenile branches lately started have prospered.

Many friendly society acts have been passed since 1783. The Act of 1875 is especially important. Royal commissions have made valuable

reports (especially those of 1825-27 and 1870-74), showing the weaknesses due to small contributions, mismanagement, and competition. These reports and permissive legislation, providing a legal status and supervision, have aided reform. Many societies are still unregistered, and hence statistics are inaccurate. In 1892 there were 29,742 societies, of which 24,598 gave in returns, comprising 8,320,262 members and funds amounting to £26,003,061. In 1904 the funds of the friendly societies were over £50,000,000. More comprehensive reports have been made under the Friendly Societies Act of 1896 as amended in 1908. Of the 31,469 societies reported in 1910, 29,425, with a membership of 14,507,000 and funds amounting to £62,866,000, submitted reports. The Independent Order of Odd Fellows, Manchester Unity (1822), with about 750,000 members and an income of £1,500,000, and the Ancient Order of Foresters (1835), with 620,000 members and an income of £1,400,000, are the leading affiliated orders. The Hearts of Oak Benefit Society and the Rational Aid and Burial Association are representative of the centralized associations. Since 1870 the friendly societies have formed an association to watch legislation and protect their interests. This has led to cooperation through medical aid associations and investment associations. Scotland has many societies, they are a later growth in Ireland, several have been introduced into Australia, Canada, and the United States. The friendly society has an important place in the development of the English workingman, but it does not reach equally all grades of the working class, especially the very poor and helpless. Consult Baernreither, *English Associations of Working Men* (trans by Alice Taylor, London, 1893), Wilkinson, *The Friendly Society Movement* (ib, 1886), id, *Mutual Thrift* (ib, 1891), *Nineteenth Century*, 45, 891, Fuller, *The Law Relating to Friendly Societies* (3d ed, London, 1910). See BENEFIT SOCIETIES, FRATERNAL INSURANCE, OLD-AGE PENSIONS, POOR LAW.

FRIEND OF MAN, THE A sarcastic popular title for Victor Riquetti, Marquis de Mirabeau, the father of the revolutionist. It was suggested by the title of his work, *L'Ami des hommes*.

FRIENDS, THE, or THE SOCIETY OF FRIENDS A denomination of Christians often known as Quakers, dating from about 1647. In spite of cruel and severe persecutions the Friends succeeded in establishing themselves in Europe and America. They have never been numerically powerful, having at no time exceeded, if indeed they have ever reached, 200,000 members, but the purity of life which has so honorably distinguished them as a class has unquestionably exercised a salutary influence on the public at large, while in respect to certain great questions affecting the interests of mankind, such as *war*, *slavery*, and *oaths*, they have, beyond all doubt, originated or emphasized opinions and tendencies which are no longer confined to themselves, but have widely leavened the mind of Christendom.

History. The founder of the Friends was George Fox (q v), who was born in Fenny Drayton, Leicestershire, England, 1624. He began to preach about 1647 and soon drew around him many who, like himself, were "dissatisfied with the teachings and practices of the day and were longing for a higher and more spiritual life." Neither Fox nor his adherents at first had any

intention of establishing a new branch of the Church. Such a result, however, was inevitable from the doctrines which they preached, for such were practically incompatible with the practices of the denominations then existing.

For three or four years Fox's missionary labors were for the most part confined to the central part of England. But in 1652 he came into Lancashire, to Swarthmoor Hall, near Ulverstone, the residence of Judge Fell and his wife, Margaret. This able woman became one of Fox's strongest adherents and supporters. From this neighborhood a band of 60 Quaker missionaries went forth to preach the doctrines of the new religious movement. The continual travels of Fox, and the labors of this band of preachers, enforced by the simplicity, the truthfulness, and the spiritual power of their message, soon gathered thousands of adherents. It is estimated that in London alone there were 10,000. It has often been said that these early preachers were ignorant men from the lower classes. Such a statement is far from the truth, as among them were former Independent ministers, university graduates, officers of Cromwell's army, schoolmasters, and not a few persons of property.

The doctrines held by the Friends, and their refusal to take any oath, to pay tithes, to obey laws deemed by them iniquitous, such as the "Conventicle Act" and the "Five-mile Act," brought them into constant conflict with the authorities. During the 25 years of the reign of Charles II 13,562 were imprisoned in various parts of England, 198 were transported as slaves, and 338 died in prison or of wounds received in attacks upon their meetings. It was not until after the revolution of 1688 that they were secure from serious molestation.

The increase in numbers made necessary some kind of organization. That adopted was almost wholly the work of Fox, and in its essential features is still preserved, as described below.

After the time of persecution came a lull in the history of the denomination, and more attention was given to internal affairs than to missionary effort. The "discipline" was administered rigidly, and the number of members diminished greatly during the eighteenth and first half of the nineteenth centuries. Still as in America, great attention was paid to philanthropic work. Later foreign and home mission work was actively entered into, the loss in membership was checked, and a new spirit of earnestness, which still continues, pervaded the body.

The Quaker movement was not confined to England, it spread to Scotland, to Ireland, in some degree to the Continent, and in 1656 to America. In that year Ann Austin and Mary Fisher arrived in Massachusetts. They were cruelly treated, imprisoned, and then sent back to Barbados, whence they had come. Similar harsh treatment meted out to others, or even the execution on Boston Common (1659-61) of three men and one woman (see BOSTON, DYER, MARY), did not deter Friends from visiting America. In spite of persecution converts were made and meetings established in nearly all the English colonies. George Fox himself traveled in America (1671-72).

Their numbers were relatively large, and the Friends exercised no little influence in Rhode Island, Long Island, New Jersey, and Maryland. Perhaps the most important incident in their history, whether in the Old or New World, was

the settlement of Pennsylvania by William Penn in 1682, and the control of that Colony by the Friends for about 70 years. See PENNSYLVANIA.

Soon after the cessation of persecution the Friends withdrew from active aggressive movements and turned their attention to perfecting and administering their discipline, to the practice of philanthropy, notably to the extinction among their membership of the custom of holding slaves, and to labors in the general antislavery cause, also to caring for the American Indians, improving the condition of prisoners, the insane, etc. The rigid application of the "Discipline," especially the "disowning" (depriving of membership) of those who had married nonmembers, was one of the chief causes of a steady decline in membership which increased in extent as the years went on. The greatest blow to the Friends, however, was the "separation of 1827-28." This was a schism due to several causes. The immediate occasion was the preaching and teaching of Elias Hicks (qv), a prominent Friend. He promulgated doctrines closely approaching what are usually known as Unitarian views. He also made statements which seemed to undervalue the Holy Scriptures and their divine authority. More than one-half of the Friends in the Middle States followed Hicks, but they were largely in the minority as compared with the whole body of Friends. The larger party was recognized by the London Yearly Meeting in England. The two divisions are often called "Orthodox" and "Hicksite," and are so distinguished in the United States census reports. Neither name is strictly accurate. The smaller division prefer to be called the "Liberal Branch."

The effect of the schism upon the "Orthodox" body was to bring about a movement in favor of a higher education and a doctrinal belief more nearly allied to that of the so-called "evangelical" bodies. The leader in this movement was Joseph John Guiney (qv), a highly educated and prominent Friend, of Norwich, England. This new tendency, however, excited considerable opposition among some of the "orthodox" Friends in America, which resulted in another separation. These separatists were called "Wilburites" from John Wilbur, of Massachusetts the leader of the movement. The points of difference did not concern the essentials of Christianity, but rather their practical application, and also points of discipline and methods of administration. This schism was not general, and the number of separatists were small.

There remains still another body called the "Primitive Friends." They may be described as ultra-Wilburite. They number less than 250 members.

The Friends in Great Britain and Ireland do not differ in any important respects from their brethren in America. Owing to the conscription laws which prevail on the continent of Europe, it has been almost impossible for the Friends to maintain meetings there. In all, only about 250 members are found. In Australasia there are about 500, and there are a few in Turkey and in Asia. Bodies of considerable size of native converts to Christianity which are organized as Friends exist in India, China, and Japan.

Doctrine. It is perhaps more in the spirit than in the letter of their faith that the Friends differ from other orthodox Christians. This was

so from the first. The epistle addressed by George Fox and other Friends to the Governor of Barbados, in 1671, contains a confession of faith not differing materially from the fundamental doctrines of evangelical bodies. The Friends have no formal creed or confession, and they have avoided the use of technical theological phraseology. Declarations of faith, however, have been issued from time to time, notably in 1693, 1829, and 1887. In all of these the position taken on essential points of doctrine is substantially the same as that of the great bodies of Protestant Christianity.

Their most distinguishing doctrine is that of the immediate personal teaching of the Holy Spirit to the individual. This has often been called the "Inner Light," or the "Christ Within." This doctrine has often been misunderstood. Some of the early Friends themselves are not clear in their statements regarding it. George Fox unquestionably states the doctrine truly when he says, "I saw that the grace of God which brings salvation had appeared to all men, and that the manifestation of the Spirit was given to every man to profit withal." "The Lord opened to me," he says in another place, "how every man was enlightened by the divine light of Christ." Robert Barclay in the *Apology* taught that even the heathen were illumined by this light, though they might not know—as, indeed, those who lived before Christ *could* not know—the historical Jesus in whom Christians believe. In consequence of this view the Friends held that every one who lived up to the light which he had would be accepted of God. This fact, however, in no wise relieved the individual from the duty of seeking to obtain more light, neither did it relieve those who had the gospel from the duty of carrying it to those who had it not. The early Friends were among the most active Protestant missionaries of their day. The doctrine of the direct manifestation of the Holy Spirit to the individual lies at the root of most of their special doctrines. It is the Holy Spirit who calls and qualifies for religious service, therefore *all* believers are "priests unto God," and there is no division into clergy and laity.

The early Friends accepted the usual view of the Bible that it was a divinely inspired volume. Because, however, they exalted the direct teaching of God, it was sometimes charged that they depreciated the historic record. There does not seem to be much basis for this charge. Later in some sections a more easy view of inspiration has obtained, made possible by increasing emphasis upon the exclusive authority of the "Christ Within."

Practice. It follows from the doctrine that the Holy Spirit calls and qualifies whom He will for religious service, that the Friends do not consider human learning a necessary qualification for the minister of the gospel. They believe that the call to this work now, as of old, is "not of men, neither by man," and that it is bestowed irrespectively of rank, talent, learning, or sex. Consequently they have no theological schools or professors of divinity. At the same time education is not undervalued, and provision is made in nearly all their colleges and higher schools for instruction in Church history, biblical languages, and allied subjects, but above all in the Bible itself. These courses are, however, not restricted to any class, but are open to all.

As fitness for the ministry is held to be a free gift of God through the Holy Spirit, so it ought to be freely bestowed upon others. But, on the other hand, whenever ministers are engaged from home in the work of the ministry they are, in the spirit of Christian love, freely entertained and have all their wants, including traveling expenses, supplied. Of recent years, in some places and under some circumstances, a minister receives partial or even whole support, but neither by minister nor by congregation is the ministry put upon a pecuniary basis. In some cases "secretaries" have of late been appointed, who are expected to exercise pastoral care and attend to the various organizations of the church. These may or may not be ministers.

Their mode of conducting public worship likewise illustrates their dependence on the guidance of the Holy Spirit. The Friends meet and usually remain in silence until some one believes that he is called upon by the Spirit to speak in exhortation, praise, prayer, testimony, instruction, or the ministry. It follows from this that there may be several communications of different kinds in the same meeting, and the exercise may be from old or young, male or female, from those who are recorded ministers or from those who are not. While this theory of the meeting for worship is still realized in England and in many of the Eastern States of the United States, in the West the form more nearly approaches that of other religious bodies, with a prearranged programme and a prepared sermon.

Friends reject the ordinances of baptism and the eucharist as these are observed by other Christians. They believe that the true Christian baptism is a spiritual one and not one with water. They believe that the true communion is inward and spiritual and consists, not in any symbolic breaking of bread and drinking of wine, but in that daily communion with Christ through the Holy Spirit and through the obedience of faith by which the believer is nourished and strengthened. They believe that Christ did not command *any* outward ordinance as of perpetual observance, that if the true spiritual baptism is experienced and the true spiritual communion is partaken of, there is no need of any symbol. They believe, moreover, that the symbol tends to call attention away from the essential and beget a reliance upon the outward and nonessential.

The taking and administering of oaths is regarded by the Friends as inconsistent with the words of Christ, "swear not at all," and with the injunction of the Apostle James, "Above all things, my brethren, swear not, neither by heaven, neither by the earth, neither by any other oath, but let your yea be yea, and your nay, nay, lest ye fall into condemnation." They have also refused to contribute to the support of a state church.

The Friends have likewise consistently protested against war in all its forms, and they have repeatedly advised their members against in any way aiding or abetting military affairs. In support of this belief the Friends have at various times suffered much in person and property. They regard the profession of arms and fighting as diametrically opposed to the general spirit of Christ.

The Friends may certainly claim to have cultivated the moral sense of their fellow countrymen in regard to the emancipation of the

slaves and the abolition of the slave trade. As early as 1688 the Friends of Germantown, Pa., made a written protest against slavery. The feeling that slavery was wrong continued to grow, through the labors of John Woolman, Anthony Benezet, and others the feeling became a conviction of the body, and by the close of the eighteenth century slavery was banished from the Friends.

Discipline. By the term "discipline" the Friends understood "all those arrangements and regulations which are instituted for the civil and religious benefit of a Christian church." The necessity for such discipline made itself felt soon after the rise of the body, and the result was the gradual establishment of certain meetings or assemblies. These are four in number: first, the *preparative* meetings, second, the *monthly* meetings, third, the *quarterly* meetings, and fourth, the *yearly* meetings. Preparative meetings are wholly subordinate to the monthly meetings, they have little power, they attend exclusively to local matters, and where they exist must report to monthly meetings. The decided tendency in America is to give them up, and in the new Uniform Discipline they are discontinued. The monthly meeting is the executive power, so far as the membership is concerned, subject to appeal to the quarterly and yearly meetings. It decides in cases of violation of the discipline and has the power to receive into membership or to disown. It attends to all cases of immoral conduct, cares for the poor, and encourages the right exercise of the gifts of the members. The quarterly meetings are composed of several monthly meetings and exercise a general supervision over the latter, from which they receive reports, and to which they give such advice and decisions as they think right. The quarterly meetings send representatives to the yearly meeting. The term "yearly meeting" is used in two senses: first, the body of members who live within certain defined geographical limits, of this use mention will be made later on under the head *Statistics*; second, the annual assembly or conference, consisting primarily of representatives from the quarterly meetings, but every member has the right to take part in the deliberations and conclusions of the assembly. The function of the yearly meeting is to consider the condition of its membership in all its aspects. To it exclusively the legislative power belongs, and from its decisions there is no appeal. As its name implies, it is held but once a year, but in order that the interests of the body might not suffer between its sessions, a meeting was instituted first called the "Meeting for Sufferings," because its chief business was to take cognizance of the sufferings of Friends for conscience' sake, then, the "Representative Meeting", and still later the "Permanent Board." This body has stated times of assembling, but can, if necessary, be called together at short notice.

The officers of the organization are (1) *overseers*, appointed by each monthly meeting for a term of three years, they are two or more in number, usually equally divided between the sexes, and their duties are the oversight and watchful care of the membership, (2) *elders*, two or more in number, of both sexes, appointed by monthly meetings with the approval of the quarterly meeting, they now usually hold office for three years, their chief duty is to exercise care over the ministry, (3) *ministers*, as al-

ready implied, the Friends do not appoint ministers, but "record" those upon whom they believe the gift is conferred through the Holy Spirit

There is no doubt that a great change has come over the Friends. This is noticeable in externals rather than in doctrine. Any distinctive garb has been laid aside by almost all members, the use of the "plain language"—"the thee and thou of the Quakers"—also, except familiarly among themselves, has been practically dropped, and the numerical names of the days and months are used only in official statements and among themselves. It is true some exception to these statements must be made more particularly in regard to the "Wilburites" and the Friends in Philadelphia Yearly Meeting, but even in the latter the tendency is towards disuse. The discipline is administered in accordance with the spirit rather than the letter, and there is a general falling away from formalism. In many of the meetings of the Middle West and West there are "pastors" whose duty is pastoral visitation and the care of the meetings for worship, where the whole time of the "pastor" is given to such work a very moderate support is generally afforded.

The Friends are an active missionary body, and foreign missions are supported at various points in Madagascar, India, China, Japan, Africa, Mexico, Cuba, and Jamaica, and among the Indians of the United States and Alaska. There is an American Friends' Board of Foreign Missions, whose duty is to have a general oversight, but not control, of the foreign missionary field. Great efforts have been made to bring about a closer union of the various yearly meetings, for they are now independent. This is shown by general conferences held at various times, and since 1887 every five years. From these conferences the plan of a regular meeting with defined powers to be held every five years has been adopted. This Five Years' Meeting, as it is called, is composed of delegates from all the yearly meetings uniting in the plan, the first meeting was held in October, 1902, at Indianapolis, Ind. Besides this a "Discipline" for all the American yearly meetings has been drawn up and has already been adopted by a majority and probably will be adopted by all except one or two yearly meetings. This Discipline and the Five Years' Meeting form the basis of a union which somewhat resembles that of the United States under the Articles of Confederation. It is too soon to forecast what the result of these efforts will be. All these remarks apply only to the "Orthodox" body.

In England a most significant movement is the establishment of an "Adult School"—a movement originated and still largely managed by Friends. This now embraces some 100,000 adherents, mostly of the working classes.

A pleasant feature of recent date is the tendency for all branches of Friends to meet in conference to consider questions like peace, temperance, and social work, upon which they can unite on common grounds. The "Hicksites" have not entered into the foreign mission field, but have been active in philanthropic efforts of various kinds, and the different yearly meetings have found a close bond of union in association for this philanthropic work.

The subject of education has claimed the earliest attention of both "Orthodox" and "Hicksite" bodies. The former, besides a number of board-

ing schools, have, for higher education, Haverford College, Haverford, Pa., Guilford College, N. C., Wilmington College, Wilmington, Ohio, Earlham College, Richmond, Ind., Penn College, Oskaloosa, Iowa, Friends' University, Wichita, Kans., Whittier College, Whittier, Cal., Pacific College, Newberg, Oreg., Bryn Mawr College for Women, Bryn Mawr, Pa., though controlled by Friends, is undenominational. The "Hicksite" body has excellent schools, and Swarthmore College, for both sexes, at Swarthmore, Pa. During the past few years general summer schools for the study of religious history and biblical literature have been held at Haverford, Earlham, and Swarthmore colleges, and elsewhere, besides other summer schools of more limited extent.

Statistics. The "Orthodox" have 16 yearly meetings, viz., London (for Great Britain), Dublin, Canada, New England, New York, Philadelphia, Baltimore, North Carolina, Ohio, Wilmington (for southern Ohio and Tennessee), Indiana, Western (Indiana), Iowa, Kansas, California, and Oregon, there are also the small communities scattered throughout the world, as already noted. The "Hicksites" have seven yearly meetings—New York, Genesee (western New York), Philadelphia, Baltimore, Ohio, Indiana, and Illinois. The "Wilburites" have six—New England, Canada, Ohio, Western (Indiana), Iowa, and Kansas. In 1913 the "Orthodox" in America numbered 99,308 members, in Great Britain, Australia, and Ireland, 22,350, total, 121,658. The "Hicksites" had about 19,000 members, the "Wilburites" 4000, the "Primitive" branch 200, total, for all bodies, 144,858.

FRIENDSHIP IN FASHION. A comedy by Thomas Otway.

FRIENDS OF GOD (Ger. *Gottesfreunde*). A small body of religious reformers of mystical tendencies, which originated in the fourteenth century and labored for the reformation of the Church and society, continuing their adherence to the former. The name was derived from John xv 15. Tauler (qv), the great Dominican mystic of Strassburg, and Heinrich Suso (qv) were of the brotherhood, and Meister Eckhart (qv) sympathized with it, although probably

not belonging to it. It also included many Dominican nuns. The brotherhood is head of in Basel, Strassburg, and Cologne, but probably had members elsewhere. Sympathizing to some extent with the Brothers of the Free Spirit, they nevertheless avoided the fanaticism ascribed to that body. (See BROTHERS AND SISTERS OF THE FREE SPIRIT.) Consult Jundt, *Les amis de Dieu au quatorzième siècle* (Paris, 1879), Rieder, *Der Gottesfreund vom Oberland* (Innsbruck, 1905), Jones, *Studies in Mystical Religion* (New York, 1909).

FRIENDS OF THE PEOPLE An English society founded in 1792 by Sheridan and Grey for the purpose of promoting parliamentary reform. Among its members were Lord John Russell and Lord Edward Fitzgerald. It was opposed by Fox and Pitt. The reform bills brought forward by Grey in 1792, 1793, and 1797 received scarcely any support. In fact, during the struggle with Napoleon the times were not favorable to any constitutional change, and so the association languished, serving mainly as a school in which were trained the great leaders who 40 years later saw its original purpose accomplished in the Reform Bill of 1832.

FRIENDS OF THE TEMPLE (Ger *Tempelgesellschaft, Tempelverein, Jerusalemsfreunde*) A German sect, called also the **TEMPLE SOCIETY** and **HOFFMANNITES**, who, accepting the Scriptures in full, expect the fulfillment of all the prophecies and believe it the duty of Christ's disciples to labor to promote that end, as Christ Himself came to do. The first step is to gather the people of God in Palestine, and with this idea spiritual communities called Temples are instituted in different countries, to assist in the construction of the Temple in the Holy Land. The society originated in Württemberg towards the middle of the nineteenth century under the lead of the Rev. Christopher Hoffmann. In 1868 a colony was established at Jaffa, the following year one at Haifa, and others have been added at Saron, near Jaffa, at Jerusalem and at other places in Palestine. The doctrines of the Friends of the Temple have not been formulated into a creed. The spiritual development of the members is a matter to which careful attention is given. The rite of baptism and the Lord's Supper are observed, but are not under definite regulation, individual convictions being allowed to prevail in the choice of the method. The religious aspects of the movement have declined from Hoffmann's death in 1885, and its importance to-day is chiefly on the economic side and in its support of German interests in the East. There is a community in Württemberg, one in Alexandria, Egypt, and one in the United States, with about 350 members. There are about 1500 colonists in the East. Consult Hoffmann, *Occident und Orient* (Stuttgart, 1875), id., *Mein Weg nach Jerusalem* (ib., 1881-85), Kalb, *Kirchen und Sekten der Gegenwart* (1907).

FRIES, frēs, ADRIEN DE See VRIES.

FRIES, BERNHARD (1820-79) A German landscape painter, born at Heidelberg. He studied at Karlsruhe under Koopman and at Munich, where he was influenced by Rottmann, and later in Geneva under Calame. He traveled in France and Austria and remained eight years in Italy. His best works are a cyclis of 40 Italian views. He was forced to sell them separately, two are in the vestibule of the Technical High School in Munich. They are poetically conceived and carefully painted. Other landscapes are in the

Munich Pinakothek, the Schack Gallery, Munich, and the Stuttgart Museum.—His brother ERNST (1801-33) was born at Heidelberg. He was a pupil of K. Kuntz at Karlsruhe and afterward studied in Munich, Heidelberg, and in Italy. On his return he lived in Munich and Karlsruhe. Despite his short life, Fries left some excellent pictures, such as "A View of Tivoli," "The Waterfall of Liris at Isola di Sora" (Munich Pinakothek), "Landscape in the Sabine Mountains" (Leipzig Museum), and "A View of Heidelberg" (National Gallery, Berlin). The works show a sincere feeling for nature.

FRIES, ELIAS MAGNUS (1794-1878) An eminent Swedish botanist. He was born in the parish of Femsjö and studied at the University of Lund, where he became demonstrator in botany in 1828. In 1834 he went to the University of Upsala as professor of economic science, to which chair after the death of Professor Wahlenberg, in 1851, was united the chair of botany. In the latter year he was also appointed director of the Upsala Botanic Garden, and in 1859 he retired from active work. Fries made important contributions to all departments of systematic botany, but especially to the knowledge of lichens, fungi, and mosses, upon which groups of plants he wrote many important works. Some of his publications are *Systema Mycologicum* (3 vols., 1820-32), *Elenchus Fungorum* (2 vols., 1825), *Lichenographia Europaea Reformata* (1831), *Flora Scandinavica* (1835), *Sind die Naturwissenschaften ein Bildungsmittel?* (1844), *Summa Vegetabilium Scandinaviae* (2 vols., 1846-49), *Novæ Symbolæ Mycologicae* (1851), *Monographia Hymenomycetum Suecicæ* (2 vols., 1857-63), *Epioris Generum Hieraciorum* (1862); *Sveriges athena och giftiga svampar, Fungi Esculentæ et Venenati Scandinaviae* (1862-69), with 93 colored plates, *Botaniska utflygter*, three volumes of collected short papers (1843-64).

FRIES, JAKOB FRIEDRICH (1773-1843) A German philosopher, born at Barby, Saxony. He studied there and in the universities of Leipzig and Jena and became a lecturer in philosophy at the latter in 1801. From 1806 to 1816 he was professor of philosophy and elementary mathematics at Heidelberg, and from 1816 until his death professor of theoretical philosophy at Jena. His chief work is the *Neue Kritik der Vernunft* (3 vols., 1807), an attempt to find a new basis for the critical philosophy of Kant. His method is psychological. He holds that a knowledge of the a priori cognition of Kant is to be attained only by the a posteriori process of subjective experience. Hence, the a priori element, inasmuch as it is discoverable only by subjective experience, is not, as Kant contends, transcendental to all experience. Therefore philosophy finds its ultimate foundation in subjective knowledge and its true exposition through psychological analysis. Other differences from the Kantian teaching are also encountered in Fries, whose work, though ingenious, may be said to contribute little to the progress of speculation.

FRIES, JOHN (c 1764-1825) The leader of the so-called "Fries Rebellion" in Pennsylvania in 1799. He was the son of a Pennsylvania farmer and was successively a cooper's apprentice, a soldier (during the Whisky Insurrection), and an auctioneer. In July, 1798, Congress voted a direct tax of \$2,000,000, \$237,000 of which was fixed upon, in January, 1799, as

Pennsylvania's quota Soon afterward Federal officers began to make the assessments In Pennsylvania the tax fell chiefly on houses and lands, the value of the former being determined by the number and size of the windows Among the Germans in the counties of Montgomery, Lehigh, Bucks, and Berks, a regular opposition, under the leadership of Fries, was organized to the assessment of what they considered a "window tax" This led to open conflict with the Federal officers, and at Bethlehem, on March 7, a considerable force of disaffected farmers and some militia under Fries compelled the United States marshal to liberate 30 prisoners who had been arrested for opposing the law Finally the militia was called out by President Adams, and many of the rioters, including Fries, were captured and taken to Philadelphia Here Fries was twice tried for treason, and was each time found guilty and sentenced to death, but was eventually (April, 1800) pardoned by President Adams, who at about the same time issued a general amnesty to all who had been concerned in the uprising Afterward Fries settled in Philadelphia and acquired a considerable fortune in the tinware trade Consult Davis, *The Fries Rebellion* (Doylestown, Pa., 1899), McMaster, *History of the People of the United States*, vol. II (New York, 1907), and, for an account of the trial, *Das erste und zweite Verhör von John Fries* (Allentown, Pa., 1839)

FRIESE, frē'ze, RICHARD (1854-) A German animal and landscape painter, born at Gumbinnen, East Prussia He studied at the Academy in Berlin After traveling in the East in Norway, and as far as the polar regions, he rapidly acquired his present reputation as one of the best animal painters in Germany He is especially noted for his vivid delineations of the lion's life in the desert and also of the native deer world in the German forest The landscape portion of his pictures is especially good He became a member of the Berlin Academy in 1892 and professor in 1896 His works include "Lions Surprising Caravan's Camp" (1884), Dresden Gallery, "Elks on Field of Battle" (1890), National Gallery, Berlin, "In the Bredszell Moor" (1895), Königsberg Museum, "A Twenty-pronged Stag under Way," owned by Emperor William II

FRIESEKE, frē'ze-kē, FREDERICK CARL (1874-) An American genre painter, born at Owosso, Mich He studied at the Art Institute, Chicago, the Art Students' League, New York, and under Constant, Laurens, and Whistler at Paris After his twenty-fifth year he lived in France, spending much of his time at Giverny in Eure, the residence of Claude Monet He is a decided Impressionist, yet does not seem to have been influenced by any master of the group except Renoir His subjects are usually female figures in bright-colored interiors or in his beautiful garden The nude has played a considerable part in Frieseke's work, as, e.g., in his picture in the Luxembourg Gallery (Paris), "Before the Mirror" He made frequent and successful trips to America, painting decorations and contributing to various exhibitions The first individual exhibition of his work in New York was held in 1912 He received numerous awards, including gold medals at Munich (1904) and Philadelphia (1913), was elected an associate of the National Academy and the Société Nationale des Beaux-Arts, and is represented in the galleries of Vienna, Odessa, Venice, Savannah, and other

cities The Metropolitan Museum, New York, possesses "The Toilet", the Art Institute, Chicago, "The Open Window"

FRIESEN, frē'zen, HERMANN, BARON (1802-82) A German Shakespearean scholar He was educated at Leipzig and Göttingen and occupied several positions at the court of Saxony He became known for his *Briefe über Shakespeares Hamlet* (1864) and *Shakespeare-Studien* (1874-76) He also made valuable contributions to the *Jahrbuch* of the German Shakespeare Society

FRIESEN, KARL FRIEDRICH (1785-1814) A German patriot He was born at Magdeburg, studied at the Academy of Architecture, Berlin, collaborated on the great atlas of Mexico edited by Humboldt, and in 1810 became an instructor in the Plamann Institute In 1810-12 he rendered important services to Jahn in the establishment of German gymnastics Upon the outbreak of the German War of Liberation, in 1813, he assisted in organizing the volunteer corps of Major von Lützow, whose adjutant he became After the dispersion of the corps by Napoleon at Rheims he was captured and shot by the French at La Lobbe, Aidennoes, March 15, 1814 In 1843 his body was buried in the military cemetery at Berlin He has frequently been celebrated by German writers, in particular by E. M. Aindt in "Es thront am Elbestrande" Consult the life by Euler (2d ed., Berlin, 1899)

FRIESEN, RICHARD, FREIHERR VON (1808-84) A statesman of Saxony He was born at Thurmsdorf, Saxony, was educated at Göttingen and Leipzig, entered the civil service of Saxony, and was Minister of the Interior from 1849 to 1852, resigning because he did not agree with Von Beust on tariff questions In 1858 he became Minister of Finance and in 1867 of Foreign Affairs also He was appointed in 1870 a commissioner to arrange in Versailles treaties with the South German states looking to the unification of Germany From 1871 until his retirement in 1876 he was president of the ministry Consult his *Erinnerungen aus meinem Leben* (Dresden, 1880), and Beust's reply, *Erinnerungen zu Erinnerungen* (Leipzig, 1881)

FRIESIAN, or **HOLSTEIN-FRIESIAN**, CATTLE See *Dairy Cattle*, under CATTLE

FRIESIAN ISLANDS See AMRUM, TER-SCHELLING, TEXEL

FRIESLAND, or **VRIESLAND**, frē'zland (Lat *Frisia*) A northwestern province of the Netherlands, bounded by the North Sea, Zuyder Zee, and the provinces of Groningen, Drenthe, and Overijssel (Map Netherlands, D 1) Area (including the islands of Ameland and Schiermonnikoog), 1282 square miles The land is flat and in some parts of the northeast below the level of the sea, but very gradually ascends towards the southeast It is walled up by numerous dikes and sluices Streams are few, but there are numerous canals and lakes abounding in fish About 60 per cent of the area being composed of meadows and heath, Friesland is better adapted to pastoral than purely agricultural industries It breeds excellent horses and other domestic animals, which, with dairy products, are the chief exports On the higher ground industry is confined to peat digging The manufacturing industries are comparatively insignificant The capital is Leeuwarden (qv) Pop., 1905, 356,017, 1912, 366,305

FRIETCH'IE, BARBARA See BARBARA FRIETCHIE

FRIEZE, frēz (OF *frise*, *fruze*, Fr *frise*, OIt *frigo*, *friso*, *fregio*, It *fregio*, probably from ML *phrygum*, *frisum*, embroidered work, from Lat *Phrygius*, Gk *Φρύγιος*, *Phrygius*, Phrygian, from *Φρύξ*, *Phryx*, Phrygian, otherwise connected with OF *fiser*, *fizer*, Fr *fiser*, OFries *frisle*, *fiesle*, hair of the head) In architecture, a horizontal band, plain or decorated, especially in classic and neoclassic styles, the middle member of an entablature (q v) In the Doric order (see ORDERS OF ARCHITECTURE) the frieze is divided into square panels, called *metopes* (q v), by the vertically grooved triglyphs In the other orders the frieze is either plain or adorned with relief sculpture of figures (whence the Vitruvian name *zoophorus*, 'bearer of living forms') or ornament The celebrated frieze of the Parthenon, with its relief of the Panathenaic procession, surrounded the cella wall at the top immediately under the pteroma ceiling Other famous Greek friezes were those of the choragic monument of Lysicrates, the mausoleum of Halicarnassus, the Xanthus tomb, the Treasury building at Delphi, the temple of Nike Apteros at Athens, that of the temple of Apollo at Phigaleia and of the temple and altar at Pergamon The Romans adorned their friezes with rich carving of ornament and of symbolic forms, rarely with figure reliefs The Renaissance revived the Roman practice and developed also splendid forms of painted frieze decoration Modern art has followed both the Greek and the Roman system, but without as yet producing any consummate example

FRIEZE, HENRY SIMMONS (1817-89) An American scholar and writer, born in Boston, Mass After 1830 he was a clerk and organist He graduated at Brown University in 1841, until 1845 taught there, and then until 1854 in the grammar school of the university He then left Brown to accept the professorship of Latin at the University of Michigan, a position which he held until his death From 1869 to 1871 he was acting president of the university, during this period most of the academic privileges were thrown open to women Frieze devised a system of inspection which established an official connection between the university and the high schools of the State In the year 1880-81 he was again acting president He edited Vergil's *Aeneid* and books x and xii of the *Institutes* of Quintilian, delivered and published addresses on *Ancient and Modern Education* and *Art Museums*, and presented valuable reports to the Michigan State Board of Regents His last work was *The Story of Giovanni Dupré* (1886)

FRIG'ATE (from OF *fregate*, possibly from Lat *fabricata*, *sc navis*, ship, p p of *fabricari*, to build, from *fabrica*, workshop, from *faber*, artisan) A warship of a type now long obsolete The term was used in the Mediterranean in the fourteenth and fifteenth centuries—and perhaps for many centuries before—to designate a narrow, fast-sailing vessel, fitted also to be propelled by oars, and having holes in the sides for the passage of the latter resembling gun ports These vessels were small and were used for ordinary purposes of traffic and not for war Their shape and speed caused the model to be followed for larger craft adapted for heavy weather in the open sea In the sixteenth century the term was very generally applied to merchant ships in all the countries of western Europe Towards the close of the century certain of these merchant frigates were hired for

service in the English navy, but they appear to have been quite small craft The first frigate built in England was the *Constant Warwick*, built at Ratcliffe by Peter Pett the elder, as a privateer for the Earl of Warwick, and afterward purchased by the government The model was taken from a French frigate, according to the Earl's son, but Pett, or his friends, claimed that he was the inventor of the frigate The *Constant Warwick* carried 26 guns as a privateer, but the battery was gradually increased to 42 guns in 1677 The distinguishing characteristics of frigates grew to be speed and handiness combined with moderate size The type began to crystallize during the seventeenth century, and soon after the middle of the eighteenth it was well established Frigates were then rated as forty-fours, thirty-eights, thirty-sixes, thirty-twos, twenty eights, and twenty-fours, according to the number of guns carried Ships carrying less than 32 guns were rarely frigate-built, and it was common for frigates to carry several guns more than implied in their rating, particularly after the introduction of carronades (See CARRONADE) At the beginning of the nineteenth century a frigate was a vessel carrying guns on one covered deck and on an uncovered deck above this If these were all long guns, the gun-deck (lower) battery consisted of 26 to 32 long 18-pounders or 12-pounders, and the spar-deck battery of six to twelve 6, 9, or 12 pounders The rig was that of a ship, three masts, square-rigged on all The tonnage—a rather uncertain measure of size—of the British frigates varied between 500 and 1200, some of the United States navy were larger (See CONSTITUTION, also, section on *Navy* in article UNITED STATES) After the application of steam to war vessels the term "frigate" steadily lost significance and is now no longer used, except in some European navies, where *captain of frigate* is a title of rank of naval officers answering to that of commander in the United States navy Consult G C V Holmes, *Ancient and Modern Ships* (2 vols, London, 1906), and E K Chatterton, *Ships and Ways of Other Days* (Philadelphia, 1913)

FRIGATE BIRD (so called from their attacks on other sea birds), or **MAN-OF-WAR HAWK** A sea bird (*Fregata aquila*) of the order Steganopodes, related to the pelicans, and hence sometimes called "frigate pelican" It is a large bird, with black plumage, sometimes measuring 10 feet from tip to tip of its extended wings, and is capable of very powerful and rapid flight It inhabits the intertropical coasts, both of the Atlantic and Pacific oceans, often flying far out to sea, but most of the time remaining near shore Its aerial evolutions are extremely graceful, and it soars to a great elevation It is said never to dive for its prey, but to seize fishes only when they appear at the surface or above it, and flying fishes constitute no small part of its food It also pursues gulls and terns and eats the fish which it forces them to disgorge The feet are very small, but the bill is 5 inches long and strongly hooked at the tip A closely allied species (*Fregata minor*) is found in the Pacific and Indian oceans, and the two with perhaps a third comprise the whole genus, which is the only one in the family *Fregatidae*. These birds breed in companies on the ledges of sea cliffs, on trees near shore, or on the ground of oceanic islets, making a very rude nest and laying a single white egg In the breeding

season the gular pouch of the male becomes a vivid scarlet and is greatly distended, so that these birds form very striking objects as they roost upon the ground or wheel about in the throng of the colonies. The interior of the pouch is in communication with the air sacs of the neck and is filled or emptied (slowly) through the bronchi. When full, it is a semi-transparent balloon and reaches forward as far as the end of the beak and downward so as completely to hide the breast. When empty, it retracts to invisibility between the rami of the lower mandible. Consult Bennett, *Gatherings of a Naturalist in Australia* (London, 1860); Mosley, *A Naturalist on the Challenger* (ib, 1879); Buller, *Birds of New Zealand* (2d ed, ib, 1888); Forbes, *Wanderings in the Eastern Archipelago* (New York, 1885); Leiter, account of nesting of frigate birds on Phoenix Island, South Pacific Ocean, in *Proceedings of the Zoological Society of London* (London, 1891); Chapman, *Papers from the Tortugas Laboratory, Carnegie Institution Publication No 103* (Washington, 1908). See TROPIC BIRD, and also Plate of FISHING BIRDS.

FRIGATE MACKEREL. A species of mackerel (*Auax thazard*), abounding in all warm seas, sometimes in immense schools, but of little value. See MACKEREL.

FRIGGA, frīg'ga. See FREYJA AND FRIGGA.

FRIGIDARIUM. See BATH, *Rome*.

FRILL BACK. A domestic pigeon of an East Indian breed, whose feathers are wholly turned forward. The beak is very short.

FRILLED LIZARD. A large agamoid lizard (*Chlamydosaurus kingi*) of the tropical parts of Australia, remarkable for its erectile ruff and for its running on two legs only. Its habits are sylvan, and its chief resort is the trunk or lower limbs of a tree. It subsists on beetles almost exclusively, all captured alive and in daylight. At night it rests clinging to the bark in an upright position. Its ordinary attitude is with the hind legs spread and flexed, letting the vent and tail rest upon the ground, while the fore part of the body, with the head uplifted, is supported high upon the stiffened forearms. When this lizard runs, however, it holds the fore part of the body clear of the ground and goes upon the hind legs alone, after the manner of a bird. This feature, and its bearing upon the animal's ancient avine and

inconspicuously upon the neck (See LIZARD). It is dun-colored on the outside, like the rest of the body, but its inside, brought to view when erected, is brilliant with red and yellow mottlings, as also are the parts of the head otherwise concealed. Its function, evidently, is to act as a "scare" organ. The sudden expansion of this gaudy disk in the face of an enemy, with the wide-open, sharply hissing mouth in the centre, followed, as a rule, by an instantaneous rush forward, is calculated to terrify the foe completely. In addition to this harmless demonstration the long, whiplike tail is vigorously lashed from side to side, and able to inflict sharp blows likely to be both disconcerting and painful. Cf JEW LIZARD, and consult Saville-Kent, *The Naturalist in Australia* (London, 1897). See Plate of LIZARDS.

FRIMAIRE, frémär' (Fr, sleety). The third month in the French Republican Calendar of 1793. It began on November 21 in years 1 to 3 and 5 to 7, on November 22 in years 4, 8 to 11, 13, and 14, and on November 23 in year 12.

FRIMONT, frēmōng', JOHANN MARIA PHILIPP, COUNT, PRINCE OF ANTRODOCCO (1759-1831). An Austrian general, born at Finstingen, Lorraine. He studied at the Collège at Pont-à-Mousson, entered the Austrian army in 1776, fought against Napoleon, notably at Marengo, and commanded a cavalry division under Prince Schwarzenberg in Russia in 1812. In 1815, with the rank of general of cavalry, he was in command of the Austrian forces in northern Italy and subsequently of the army of occupation in France. He was appointed in 1821 to the chief command of the army sent to restore order at Naples and suppress the Carbonari, and for his services received the Italian title of Prince of Antrodocco and 220,000 ducats. In 1831 he suppressed a rising in Modena a short time before his death.

FRINGES (dialectic Fr *frinche*, ML *fringia*, OF, Fr *frange*, probably from Lat *fimbria*, border, fringe). In optics, the alternate bands of light and dark, due to the interference of waves of light, which are produced when a beam passes the sharp edge of a screen, or is transmitted through a narrow slit or hole, or biprism, or by reflection from a Fresnel mirror, are called fringes. See DIFFRACTION AND DIFFRACTION GRATINGS, INTERFERENCE. LIGHT.

FRINGES. In the English Bible, the translation of the Hebrew *gedilim* in Deut xxii 12, and of *sisth* in Num xv 38. The marginal reading of the Revised Version, "twisted threads" and "tassels," is probably better. In the passage in Deuteronomy the Hebrews are commanded to place fringes upon the four corners of their robes, in Numbers, in a later passage, the description is more detailed, and the reason is assigned "to remember all the commandments of the Lord." The injunction was much elaborated by the rabbis and made a matter of the first importance in Judaism (cf Matt xxiii 5). Originally the garment to which the fringes were attached was the outer one, passages in the Gospels in which it is stated that the healing power of Jesus was experienced if the hem or border of His garment were touched doubtless refer to the fringes or tassel (Matt ix 20, xiv. 36, Mark vi 56, Luke viii 44). In the course of time, because of persecution, the fringes came to be concealed and are now put by orthodox Jews on a separate garment worn under the outer, reaching only to the chest, and

A FRILLED LIZARD, RUNNING

lacertilian relationships, are discussed by Professor Saville-Kent in the *Proceedings of the Zoological Society of London* for 1895, pp 712-717. The same specialist describes, from a study of captive examples, the skin membrane about the neck as a denticulated frill, which in old lizards may measure 8 or 9 inches in diameter. It may be erected or depressed at will, but as slender processes of the hyoid bone extend into it, the membrane cannot be expanded unless the mouth is open, nor can the opening of the jaws fail to lift the bill, which is otherwise folded

called the smaller *tallith*, to distinguish it from the larger *tallith*, which also has fringes and is worn only during the recital of the prayers. In form it is a modern survival of the ancient dress of the Jews. The wearing of fringes is doubtless based on some ancient custom of a religious character, possibly they were regarded as amulets. Consult Robertson Smith, *Religion of the Semites* (London, 1894), Nowack, *Hebraische Archäologie* (Freiburg, 1894), Ben-zinger, *Hebraische Archäologie* (2d ed., Tübingen, 1907).

FRINGE TREE (*Chionanthus*) A genus of plants of the family Oleaceæ, comprising about three species of small trees or large shrubs, natives of America and China. The common fringe tree, or snowflower (*Chionanthus virginica*), is found in the United States from Pennsylvania and Delaware to the Gulf of Mexico and west to Texas. It sometimes attains the height of 20 or 30 feet, but is rarely more than 8 or 10 feet high; has opposite oval leaves 6 or 7 inches long, and very numerous snow-white flowers in

FRINGE TREE

panicle racemes. The limb of the corolla is divided into four, sometimes five or six, linear segments an inch or more long, whence the name "fringe tree." The fruit is an oval drupe. The tree is frequently cultivated as an ornamental plant.

FRINGILLIDÆ (Neo-Lat. nom. pl., from Lat. *fringilla*, a sort of small bird, probably the chaffinch) A family of typical passerine birds, having a conical or nearly conical bill, sometimes short and thick, sometimes comparatively slender and elongated, sometimes convex above, below, or at the sides, the commissure—line of junction of the mandibles—straight. The neck is short, and neither the tail nor the wings are long. The Fringillidæ are all small birds and feed chiefly on seeds, but to some extent also on insects. The family is an extremely numerous one and is distributed over all parts of the world. It is represented in America by finches, sparrows, grosbeaks, crossbills, etc., elsewhere described, and has by some systemists been

placed at the head of the list of all birds, being regarded as the most highly organized group (See FINCH). Typical forms are illustrated in the Plates FAMILIAR SPARROWS, in the article SPARROW, BUNTINGS AND GROSBEAKS, CAGE BIRDS.

FRISBY, EDGAR (1837–) An American astronomer, born at Great Easton, Leicestershire, England. He graduated from the University of Toronto in 1863 (M.A., 1864). After teaching in Canada in 1863–67, he was for a short time acting professor of mathematics at Northwestern University, in 1868–78 was assistant astronomer in the United States Naval Observatory, Washington, and in 1878 became professor of mathematics in the United States navy. He observed several eclipses for the government, computed the orbit of the comet of 1882, and had charge of the 12-inch equatorial telescope until his retirement in 1899.

FRISCH, IRISH, JOHANN LEONHARD (1666–1743) A German philologist and lexicographer, born at Sulzbach. He studied at Altdorf, Jena, and Strassburg, was for a short time a pastor at Neusohl, Hungary, and after extensive travels settled at Berlin, where in 1727 he was appointed rector of the Gymnasium zum Grauen Kloster. In 1706 he became a member of the Royal Scientific Society, and in 1731 director of the historical-philological division. Best known and most important of his works is the *Deutsch-lateinisches Wörterbuch* (1741), the result of 30 years' labor, the first work of the sort prepared on scientific principles.

FRISCHES HAF, frish'ez haf (LG, Fresh-water Bay) A large lagoon on the north coast of Prussia, southeast of the Gulf of Danzig (Map Germany, H 1). It is rather less than 60 miles in length from northeast to southwest, with a breadth which varies from 2 miles to 18 miles, and an area of 330 square miles. It has a depth of from 10 to 16 feet and was once entirely walled off from the Baltic by the Frische Nehrung, a narrow spit of land extending for about 40 miles along its north shore. In 1510, however, the waters of the Frisches Haff broke over the Frische Nehrung and formed the passage called the Gatt, which unites the lagoon with the Baltic. The Gatt, originally from 10 to 15 feet in depth, is now dredged to 22 feet. All large vessels load and unload at Pillau, which is situated at the mouth of the Gatt, on the shore of Danzig Bay. Cargoes are conveyed to and from the ports on the Frisches Haff by means of lighters. The lagoon receives the waters of the Nogat, Pregel, Frisching, and Passarge and part of the waters of the Vistula.

FRISCHLIN, frish'lén, PHILIPP NIKODEMUS (1547–90) A German philologist and Latin poet, born at Baltingen, Württemberg. He studied at the University of Tübingen and became professor of history and poetry there in 1568. Through the jealousy of his colleagues and the hatred of the nobility, whom he had angered by his satiric wit, he was compelled to relinquish his chair and in 1582 became rector of the school at Laibach in Carniola. From 1584 to 1587 he was again at Tübingen, but in 1588 became rector of a school at Brunswick. Expelled thence in 1589, as the result of a pasquinade, he wandered about for a time and finally was imprisoned in 1590 in the Hohenurach Dungeon at Mainz. He broke his neck in an attempt to escape. He wrote in Latin some indifferent tragedies, a few comedies, of some

worth, of which the best is *Julius Cæsar Redivivus* (1584), and poems, including principally *De Natali Jesu Christi*, and the *Hebræus*, a hexametric chronicle of the Jewish kings. His philological study is best represented by the *Grammatica Latina* (1585). He wrote commentaries also on Vergil and Persius and translated Callimachus and Aristophanes. Consult Strauss, *Leben und Schriften des Dichters und Philologen Frischlin* (Frankfort, 1856).

FRISCHMANN, DAVID (1863–) A Hebrew writer. He was born at Lodz and made Warsaw his residence. Beginning to write at 13, he soon caused a sensation by declaring relentless war on all the archaic traditions that hindered the development of Hebrew literature. Ever after, he endeavored to Europeanize Hebrew learning. He made admirable translations of Bernstein's *Naturwissenschaftliche Volksbücher*, Byron's *Cain*, Nietzsche's *Also Sprach Zarathustra*, and many other works. His original writings consist of both verse and prose. A complete edition of his works in 17 vols (the last consisting of critical comments on his work) was published at Warsaw.

FRIS/CO A popular abbreviation of the name San Francisco.

FRISI, frē'zē, PAOLO (1728–84). An Italian mathematician. He was born at Milan, taught philosophy at Padua, and became, in 1756, professor of mathematics at Pisa and in 1764 at Milan. In 1777 he became director of a school of architecture at Milan. When less than 23 years of age, he published a remarkable *Disquisitio Mathematica* (1751), upon the physical causes which have determined the magnitude and shape of the earth. He also published *De Atmosphæra Cælestium Corporum* (1758), *De Inæqualitate Motus Planetarum* (1760), *Del modo di regolare i fiumi e i torrenti* (1762). Consult Verri, *Memorie . . . del signor dom Paolo Frisi* (Milan, 1787), and J. C. Poggen-dorff, *Biographisch-literarisches Handwörterbuch*, vol. 1 (Leipzig, 1863–1904).

FRISIA. See FRIESLAND.

FRISIAN. See FRIESIAN.

FRISIAN LANGUAGE AND LITERATURE (OFris *Frise*, *Frese*, AS *Frīsa*, Lat *Frīsu*, possibly connected with OFris *frāse*, danger, AS *frāsan*, Goth *frāsan*, OHG *frāson*, to test). The language and literature of a branch of the Germanic family of dialects which was formerly spoken along the coast of the North Sea and on the coast islands from the Rhine to the Ems. The Frisians are first mentioned by Tacitus, who divides them into the greater and the lesser. Their boundaries varied at different periods, however, so that the entire coast line from the Scheldt to the Weser has at one time or another been occupied by those who spoke the Frisian language. Of all the Germanic dialects this is the one nearest akin to Anglo-Saxon, so that the two tongues are sometimes classed together as Anglo-Saxon Frisian. Thus, we have AS *mōna*, OFris *mōna*, moon, but OHG *māno*, Goth *mēna*, or AS. *æcer*, OFris *ekker*, field, acre, but OHG *acchar*, Goth *akrs*. On the other hand, Frisian has many points of association with Dutch and Icelandic which are not found in Anglo-Saxon, as *of*, or *wēr*, true, while the Icelandic and Anglo-Saxon have the so-called "breaking" of the vowels before *r*, *l* + consonants which does not occur in Frisian, e.g., AS *beorh*, Icel *bjarg*, hill, but OFris, OHG *berg*. It seems probable, on the whole, that the

Anglo-Saxons once occupied the land between the Frisians and the Scandinavians, and that of the Anglo-Saxon dialects the Kentish stood nearest the Frisian (e.g., OEFris *brade*, he commanded, Kent *brade*, but WS *bēode*), while next to the Kentish in this respect came the West Saxon, and finally the Northumbrian and Mercian.

Frisian is divided into numerous dialects, many of which now differ from each other to a surprising degree. Indeed, so divergent are many words in the vocabularies of the various dialects that some of the commonest terms become unintelligible after a very short distance. It is, furthermore, necessary to bear in mind the strong influence exercised by Danish over the vocabularies of many dialects. By a phenomenon, somewhat unusual in language, many terms for the most familiar objects are loan words in Frisian, being borrowed from the Danes.

Frisian may be divided first into East and West Frisian, and the former of these again into East and North Frisian. The East Frisian, using the term in this restricted sense, is subdivided into the Weser and the Ems dialects. This group has been gradually supplanted by Low German (Plattdeutsch), so that what is now often called East Frisian is, in reality, a Low German dialect. In 1890, 32 persons on the island of Wangeroog, and about 2000 in the Saterland of Oldenburg still spoke East Frisian. The North Frisian group, which formed the vernacular of about 2600 persons in 1885, is divided into seven dialects on the mainland and three on the islands. The dialects of the coast have been strongly influenced, not only by Low German, but also by Danish, and island dialects seem to show in addition the presence of West Saxon elements. Of Old North Frisian hardly any records exist, the oldest being a short inscription on a font of 1452 at Pelworm. Old West Frisian, on the other hand, is represented by literary remains which are relatively extensive, while the New West Frisian is that in which the bulk of modern Frisian literature is composed. The dialects of New West Frisian are not separated by such wide divergences as the East and North groups, although they number six, since the majority of the differences are due to the operation of analogy (q v).

The Frisian employs the Roman alphabet, but uses *u*, *v*, and *w*, as well as *c* and *k*, almost indiscriminately. The vowels have the Italian values, and the consonants are pronounced in general as in German, excepting that *s* is soft like the English *z*, and that *k* or *c* is frequently palatalized before *e* and *i* to *ch* or *sh* (written *sz*, *sth*, *ts*, *tz*, *tsz*, or, in West Frisian, simply *s*, *z*). There is a tendency to elide *r* and *l* (*dega* beside *degar*, days, Mod Fris *wood*, *woe*, AS *wolde*, Eng *would*). The guttural *g* is often vocalized to *z* (*yeld* for *geld*, payment, cf AS *geard*, Eng *yard*). The old pronunciation of *th*, as in Eng *thorn*, is still retained in some of the island dialects (WFris *thank*, thanks, but NFris *tōnk*). The sound of *h* was extremely weak. The morphology of Frisian is essentially Germanic in its type. In nouns there are the three genders, two numbers, five cases, and the division into strong and weak declensions. Even in modern North Frisian the pronoun retains the dual (*wat* and *gat*, cf AS *wit* and *gūt*), which has been lost in all other modern Germanic languages. The verbs are strong, weak, and preterite present, forming their past

tenses, as in the other dialects of this group, either by ablaut (q v), or by composition with the verb signifying to do (e.g., Frisian infinitive *finda*, to find, preterite singular *fand*, preterite plural *fundon*, past participle *funden*, AS *fundan*, *fand*, *fundon*, *funden*, Fris *hatra*, to hate, preterite *hatade*, *hatadon*, past participle *hatad*, AS *hatran*, *hatade*, *hatadon*, *gehatad*, Fris *mōta*, to be obliged, present singular *mōt*, present plural *mōton*, preterite *mōste*, AS *mōtan*, *mōt*, *mōton*, *mōste*). The passive is formed like the Germanic passive generally, except in Gothic and the Scandinavian dialects, by *wesa* (AS *wesan*), to be, with the past participle (e.g., Frisian *ih* was *funden*, AS *ic* was *funden*, I was found). The syntax of Frisian follows the general type of the older Germanic languages.

Frisian Literature Frisian literature is, relatively speaking, extremely scanty. The oldest specimens of Frisian date no farther back than the thirteenth century, although it may be shown by references to the ancient Latin chronicles that here, too, the Germanic epics had flourished at least five centuries before. These ancient epics were doubtless alliterative like the Anglo-Saxon and Icelandic poems, but beside the alliteration might be found now and then rhymed verse, as we find it, e.g., in Old High German in Otfrid's *Evangelienbuch*. As an example of such a verse, which also shows a trace of the older alliteration, we may quote

hē stifte and stīrde treuwe and wērde

(he founded and strengthened fidelity and worth). Of this class of literature the most noteworthy is the so called Privilege of Charlemagne, which purports to confer certain political rights on the Frisians. The production is, however, a forgery of the thirteenth century. It is written in rhythmic prose. The Rudolf Book, claiming to belong to the twelfth century, but probably written two centuries later, is a legendary account of the laws given by one Rudolf to the Frisians, who had been summoned to contribute a levy of troops for service against the Northmen. There is also a collection of 1671 verses edited under the title *Thet freske Ryim*, which is a translation of Low German verses and composed in a barbarous mixture of dialects which renders it practically useless for the study of the language. The prose literature is much more extensive and important. It begins about the eleventh century with an interlinear translation of the Psalms and with a late Chronicle. The remainder of the prose is devoted to legal topics. These law books fall into two sections, general and local. To the general codes belong, among others, the 17 *Keren* (petitions) and the 24 *Lōndrucht* (land rights). These were originally written in Latin and later translated into the various Frisian dialects. Besides some additions to the *Keren*, there is also the code of Upstalbōm, dating from 1323. Among the local law books by far the most important class is formed by the Prologues and Tractates. The Prologues, as the name implies, are introductions to the codes proper and deal with the history of the land or the dynasty, or treat of the theory and nature of law. Old sagas, too, are found in some Prologues, such as the saga of Karl and Redbad or that of Magnus. More miscellaneous topics contained in them are descriptions of the Day of Judgment, the Creation, the grades of the priesthood, and the like. The Tractates themselves contain the legal codes. Tax lists, formulas for taking the oath, letters,

and synodical epistles (*sinuthrucht*) are also found in the prose literature of Old Frisian.

The modern Frisian literature dates from the sixteenth century. Poetry is dead in East Friesland. In 1632 Imel Agena, of Ugent, composed a trivial poem in Alexandrines, which seems to have been a portion of a dance song. In North Friesland poetry was little better developed, although there are a few verses preserved, as well as a number of sagas current on the islands. The only important piece of North Frisian literature is J. P. Hansen's comedy *Di Gdtskals of di Sol'ring P'd'ersder* (Flensburg, 1809, 2d ed. with the addition of a story, *Di Iddelke Stjuurman*, and some poems, Sonderburg, 1833). The most important of the modern Frisian literatures is the West Frisian, which has a continuous line from the sixteenth century to the present time. Between the old and new periods of this dialect there is, therefore, almost no gap, for the last example of Old West Frisian is a law of 1559, and the first specimen of the New is a comic dialogue of 1609, *Een tsamensprekanghe van twee boesche Personen, Wouter en Tralle*. Early in the seventeenth century arose one of the greatest names in Frisian literature, that of Gysbert Japiks (1603-66). He was a true poet, turning especially towards peasant life, rich, too, in love poetry, and in the dialogue with which the modern period had begun. He was influenced by Dutch and classical models, but was, nevertheless, unaffected and unpedantic. In his last years, however, he lost his early simplicity. His imitator, Jan Althuyzen (1715-63), like Japiks, made a translation of 52 Psalms and composed in addition many occasional poems. From the time of Althuyzen till the present, no great literary name has arisen among the Frisians. Many brief poems, epithalamia, and the like, have been written, but only comedy deserves any special mention. Full of wit, and turning on the difference between the country and city, these plays portray excellently the peasant life. Most noteworthy are Eelke Menders's *It libben fen Aagtye Ijsbrants, of dy frieske boernne* (1779), *De tankbrē boeresoon* (1778), *De reys fen Marcke Juhelch* (1778), and *Het jonge nieuws boesk* (1780).

Of the later Frisian writers, the most noteworthy are the Halbertsma brothers, Joost Hiddes (1782-1869), and Eeltje (1797-1858). The latter was a poet of talent, as is evident from his *Lapehoer fen Gabe Seroar* (1822) and his *Rimen en Teltjes* (1868). Among other poets may be mentioned P. C. Salverda (*Iytljcke friesche Rympjes*, 1824), Rinse Posthumus, who wrote *Pruuewke fen friesche Ryjmmeleerje* (1824) and translated several of Shakespeare's plays, such as *Julius Caesar* and *The Merchant of Venice*. J. G. van Blom (1796-1871) was a poet of the people, and J. F. van der Wey-Rutgers, H. G. van der Veen, and C. Wielsma wrote of child life. Waling Dijkstra (1821-) is the most prolific of contemporary Frisian authors, while the most elegant is probably Pieter Jelles Troelstra (1860-), who is known not only as a lyric poet, but also as one of the editors of the Frisian monthly, *For Hús en Hiem*.

Bibliography The most complete account of the Frisian language and literature is found in Siebs, "Geschichte der friesischen Sprache," in Paul's *Grundriss der germanischen Philologie*, vol. II (2d ed., Strassburg, 1901-09), and Ge-

schichte der friesischen Litteratur, vol. III (ib., 1900), where references to all the literature on the subject are collected. Consult also Bendsen, *Die nordfriesische Sprache nach der Mooringer Mundart* (Leyden, 1860), Johansen, *Die nordfriesische Sprache nach der Fohringer und Amrumer Mundart* (Kiel, 1862), Winkler, *Allgemeen nederdutch en friesch Dialecticon* (The Hague, 1874), Cummins, *Grammar of the Old Frisian Language* (London, 1887), Colmjon, *Beknopte friesche Spraakkunst vor den tegenwoordigen Tijd* (2d ed., Joure, 1889), Siebs, *Zur Geschichte der englisch-friesischen Sprache* (Halle, 1889), Van Helten, *Altostfriesische Grammatik* (Leeuwarden, 1890), Outzen, *Glossarium der nordfriesischen Sprache* (Copenhagen, 1887), Richtshofen, *Altstfriesisches Wörterbuch* (Göttingen, 1840), Sturenburg, *Ostfriesisches Wörterbuch* (Aurich, 1862), Ten Doornkaat Kooman, *Wörterbuch der ostfriesischen Sprache, etymologisch bearbeitet* (3 vols., Norden, 1879-84), Dykstra and Hettema, *Friesch Woordenboek* (4 vols., Leeuwarden, 1896-1903), Richtshofen, *Friesische Rechtsquellen* (Berlin, 1840), Hettema, *Oude friesche Writen* (Leeuwarden, 1845-51), id., *Untersuchungen über friesische Rechtsgeschichte* (Berlin, 1880-86), id., *Bloemlezing uit oud-, middel- en nieuwfriesche Geschriften* (Leyden, 1887 et seq.), Siebs, *Sylter Lustspiele* (Greifswald, 1898), Hensei, *Alt friesisches Lesebuch mit Grammatik und Glossar* (Heidelberg, 1903), Kock, "Vocal-balance im Alt friesischen," in vol. XXX of the *Beiträge zur Geschichte der deutschen Sprache und Litteratur* (Halle, 1904), Helten, "Zum altfriesischen Vokalismus," in vol. XIX of the *Indogermansche Forschungen* (Strassburg, 1906), Jackel, "Die alt friesischen Verse vom hute des abba," in vol. XXVI of the *Zeitschrift für deutsche Philologie* (Halle, 1907), Walter, *Der Wortschatz des Altstfriesischen* (Naumburg, 1911), Sipma, *Phonology and Grammar of Modern West Frisian* (Oxford, 1913).

FRIT (Fr *fritte*, from It *fritta*, frit, from *friggere*, Lat *frigere*, to parch). An active greenish-black fly (*Oscinus frit*), of the size of a large flea, which does great injury to barley crops in the north of Europe. It lays its eggs in the flowers, and its larvæ live on the young grains. The family is represented in America by the species *Oscinus variabilis* and other minute "grass-stem flies" of the genera *Mero-myza*, *Chlorops*, etc., which damage various crops. In the Southern States they swarm in clouds at certain seasons and get into the eyes of animals and men, and to them has been attributed the spread of the disease pink eye (q v).

FRITH, or **FRYTH**, JOHN (1503-33). An English Protestant martyr. He was born at Westerham in Kent and educated at Eton and Cambridge, where Gardiner, subsequently Bishop of Winchester, was his tutor. Immediately after taking his bachelor's degree (1525), invited by Wolsey, he transferred his residence to the newly founded Cardinal College (now Christ's Church), Oxford. He made the acquaintance of Tyndal and assisted him in his translation of the New Testament. His zeal in the cause of the Reformation led to his imprisonment at Oxford for some months. At the instance of Wolsey he was released (1528) and fled to the Continent, where he resided chiefly at the newly founded Protestant University of Marburg and

was again associated with Tyndal in literary labors. At Marburg he became acquainted with several scholars and Reformers of note, particularly with Patrick Hamilton (q v). His first publication was a translation of Hamilton's *Places*, made shortly after the martyrdom of the author, and soon afterward appeared *A Pistle to the Christen Reader*, under the pseudonym "Richaede Brightwell" (1529), and *A Disputacion of Purgatorye*, a treatise against Rastell, Sir Thomas More, and Fischer, Bishop of Rochester (1531). In 1532 he ventured back to England. Warrants for his arrest were almost immediately issued, at the instance of More, then Lord Chancellor. After evading pursuit for some weeks he fell into the hands of the authorities as he was on the point of making his escape to Flanders. The rigor of his imprisonment in the Tower was abated when Sir Thomas Audley succeeded to the chancellorship, and it was understood that both Cromwell and Cranmer were disposed to leniency. But the treacherous circulation of a manuscript, *Lytle Treatise on the Sacraments*, which Frith had written for the information of a friend, with no view to publication, further excited the hostility of his enemies. He was tried and found guilty of denying that the doctrines of purgatory and transubstantiation were necessary articles of faith. June 23, 1533, he was handed over to the secular arm and was burnt at Smithfield, London, July 4. During his captivity he wrote a controversial work on the eucharist, and several tracts. Frith was the first to maintain the doctrine regarding the sacrament of Christ's body and blood which ultimately came to be incorporated in the English communion office. Twenty-three years after his death as a martyr, Cranmer, who had been one of his judges, went to the stake for the same belief, and three years later it had become the publicly professed faith of the English nation. Frith's works were published by Foxe (London, 1573), and there was another edition in 1631, Alcock, *See Heroic Men* (London, 1905).

FRITH, WALTER. An English dramatic author and critic, the son of the Royal Academician W. Powell Frith. He was born in London, was educated at Harrow and Cambridge, then studied law, and became a barrister in 1880. His best-known plays are *Brittany Folk* (1889), *Not Wisely but Too Well* (1898), *The Man of Forty* (1900), *Margaret Catchpole* (1910). He also wrote several novels.

FRITH, WILLIAM POWELL (1819-1909). An English figure and genre painter. He was born at Aldfield, Yorkshire, and was a pupil of Sass's art school in Bloomsbury and a student of the Royal Academy. In 1840 he exhibited his "Malvolio before the Countess Olivia," which attracted much public attention. His "Village Pastor," painted in 1845, made him an associate member of the Academy. For some time he continued to paint in a similar romantic vein subjects chosen chiefly from Scott, Dickens, Sterne, Goldsmith, Shakespeare, and Cervantes, such as "The Good-Natured Man" and "Dolly Varden" (South Kensington Museum), "Uncle Toby and the Widow Wadman" (Tate Gallery, London), which are good in color and well handled. After he was elected a Royal Academician in 1853 he began to depict the humorous aspect of an English crowd in such subjects as "Life at the Seaside, Ramsgate," purchased by Queen Victoria. "Derby Day" (1858, Tate Gal-

lery), and the "Railway Station" (1862, Leicester Museum). In spite of their anecdotic and literary character, these works possess real pictorial qualities. Frith was commissioned by Queen Victoria to paint the "Marriage of the Prince of Wales" (1865), and made an unsuccessful attempt to rival Hogarth in his series "The Road to Ruin" (1878) and "Poverty and Wealth." His later works include "John Knox at Holyrood" and "Private View of the Royal Academy." His pictures were exceedingly popular and often engraved. "The Dinner at Boswell's Rooms" (1869) sold in 1875 for £4567, the highest price then reached for a work by a living artist. Frith was a member of several foreign academies and a chevalier of the Legion of Honor. Consult Frith, *My Autobiography and Reminiscences* (London, 1887) and *Further Reminiscences* (ib, 1888); Ward, *Reminiscences* (ib, 1911).

FRITHJOFS SAGA, frēt'jófs sa'g'a. An ancient Icelandic myth. It was probably first written down at the end of the thirteenth or in the beginning of the fourteenth century and records the life and adventures of the hero Frithjof (properly *Frithjófr*, peace destroyer), who loved the beautiful Ingeborg, the daughter of a petty king of Norway. After being rejected by the brothers of Ingeborg and having committed various acts of revenge on his enemies, he comes to the court of the old King, Hring, to whom Ingeborg has been married, and is received with kindness. At the death of her husband Ingeborg is married to her lover, who acquires with her hand the dominions of Hring, over which he rules prosperously to the end of his days. Frithjof is supposed to have lived in the eighth century, but some writers assign to him a much earlier period. This saga was included by Björner in his collection *Nordiska Kampadaler* (Stockholm, 1737), and by Rafn in his *Fornaldar Sögur Norðrlanda* (Copenhagen, 1829). Attention has of late years been more especially drawn to this ancient saga, which is, in fact, merely one of a number of similar mythical narratives, in consequence of the Swedish poet Tegnér (qv) having selected it for the groundwork of a poem, *Frithjofs Saga*, which was published in its complete form in 1825 and at once became the most popular poem that had ever appeared in Sweden and raised its author to the height of his reputation. At times the author has preserved the severe sternness of the old viking type, often, however, he has tempered it with the sentimental characteristics of his own age. On the whole, the picture of the old Norse life is very much idealized—a fact which has brought the author much adverse criticism. But the lyric beauty alone of the poem is enough to insure it a permanent place in Swedish literature. Tegnér's *Frithjofs Saga* has been translated into most of the European languages, among the 22 or more English translations, we may instance those by Holcomb (Chicago, 1905) and Shaw (ib, 1911). For poetic beauty, Longfellow's partial translations are unsurpassed. Consult H. Hermannsson, *Bibliography of the Mythical-heroic Sagas* (Ithaca, 1912), and W. A. Craigie, *Icelandic Sagas* (New York, 1913).

FRITIGERN, frít'i-gern, or **FRIDIGERN**. A Visigothic chieftain. When, in 376, the Visigoths were crowded from Dacia by the inroads of the victorious Huns, he was permitted by Valens, Emperor of the East, to transport his

band, which nominally was Christian (Arian), across the Danube and to settle in Mœsia. Quarrels ensued between the immigrants and the Roman officials and culminated in the battle of Adrianople (Aug. 9, 378). Fritigern, in principal command of the Visigoths, there destroyed fully two-thirds of Valens's army, thus inflicting a defeat which, for actual loss on the field, was equalled in Roman annals only by the disaster at Cannæ (216 B.C.). Valens himself was killed, and his body was never recovered. Fritigern's leadership for a brief time maintained Visigothic unity, which was dissolved immediately after his death (c. 380).

FRITILLARY (from Lat. *frutillus*, dicebox, from the form of the perianth), *Fritillaria*. A genus of bulbous-rooted plants of the family Liliaceæ, natives of Europe and other temperate regions of the Northern Hemisphere. The drooping perianth, which is bell-shaped, has six distinct segments, each with a conspicuous honey pore (nectary) at the base. About 40 species, some beautiful, are known. One species, the common fritillary, or snake's head (*Fritillaria meleagris*), a native of Great Britain, blooms in April and May in meadows and pastures in the east and south of England. The stem, about 1 foot high, bears several linear leaves and, in general, only one flesh-colored, dark-spotted flower. Many varieties, including the crown imperial (*Fritillaria imperialis*), a native of Persia and the north of India, are in cultivation. Among the indigenous American species, which have scaly bulbs and are confined to the Pacific coast, the best known are *Fritillaria pudica*, *Fritillaria recurva*, and *Fritillaria camtschatcensis*, sometimes called black lily, which occurs from California to Alaska and in Siberia. In Alaska the bulbs were formerly gathered, dried, and eaten to a considerable extent. They are surrounded by many small white bulblets of the size and shape of a grain of popcorn and are sometimes called wild rice. They have been frequently taken from the crops of birds at considerable distances from where they were grown.

FRITILLARY (Neo-Lat. *frutillaria*, nom. pl., from Lat. *frutillus*, dicebox), or **SILVERSPOT**. A nymphaline butterfly, of a group mostly the genus *Argynnis*, with fulvous and black checkered wings. The hind wing is often marked with a row of silvery eyespots. There are more than 50 species in the United States, whose larvae feed at night on violets. The great spangled (*Argynnis cybele*) and the variegated fritillary (*Euptoieta claudra*) are two common North American representatives.

FRITSCH, frích, ANTON JOHANN. See FRÍCH.
FRITSCH, GUSTAV THEODOR (1838–). A German scientist and traveler, born at Kottbus (Brandenburg). He studied at Berlin, Breslau, and Heidelberg, in 1863–66 made a scientific journey to South Africa, and in 1867 became an assistant in the Anatomical Institute at Berlin. In 1868 he was a member of the expedition to Aden to observe the total eclipse of the sun, and in 1874 of the expedition sent to Ispahan, Persia, to observe the transit of Venus. He was appointed in the latter year to the chair of comparative anatomy at the University of Berlin and subsequently to that of physiology. Under commission from the Royal Academy of Sciences, Berlin, he visited the Mediterranean countries in 1881–82 for the study of electric fishes. His publications include: *Drei Jahre in Südafrika* (1868); *Die Eingeborenen*

Sudafrikas (1873), anatomical and ethnographical observations, *Die elektrischen Fische* (2 parts, 1887-90), *Die Gestalt des Menschen* (1899, 2d ed., 1905), *Aegyptische Volkstypen* (1904), *Das Haupthaar und seine Bildungsstätte bei den Rassen des Menschen* (1912)

FRITSCH, JOHANN (1849-) A German neurologist, born at Tepl, Bohemia. He studied at the University of Vienna, was appointed a lecturer there, and afterward professor of psychiatry. His publications include *Ueber die primäre Verrücktheit* (1879) and *Erfahrungen über Simulation geistiger Störung* (1890)

FRITSCH, KARL (1812-79) An Austrian meteorologist, born at Prague. He attended the university there, was for a time a government official, but privately pursued meteorological investigations, and from 1832 to his retirement in 1872 was vice director of the Austrian meteorological service. Large increase was made by him in the number of observation stations, and he contributed valuable articles to the publications of the Vienna Academy and of the Oesterreichische Gesellschaft für Meteorologie

FRITSCH, KARL, BARON (1838-1906) A German geologist, born at Weimar. He studied at the University of Göttingen and in 1873 became professor of geology at Halle. His publications include *Reisebilder von den Kanarischen Inseln* (1867), with Reiz, *Geologische Beschreibung der Insel Tenerife* (1868), *Allgemeine Geologie* (1888)

FRITZ, FRITS, DER ALTE (Ger., Old Fritz) A nickname given by the soldiers to Frederick the Great

FRITZ, JOHN (1822-1913) An American expert in the manufacture of iron and steel, born at Londonderry, Pa. He was trained as a machinist in small establishments at Parkersburg and Norristown and afterward was employed in the construction of rolling mills. In this connection he made so thorough a study of the details of iron and steel manufacture as to become an authority on the subject and to be commissioned with the equipment of the Cambria Iron Works and the well-known Bethlehem Iron and Steel Works. For many years he was manager of the latter. He was among the first to introduce the Bessemer process into the United States and was a pioneer in other methods now generally used. In his honor a medal was established by a group of scientists and manufacturers, in 1902, to be known by his name and to be awarded in recognition of notable discoveries in industry and science, and in 1910 the Franklin Institute awarded him the Elliott Cresson medal. He was president of the American Institute of Mining Engineers in 1894 and of the Society of Mechanical Engineers in 1896.

FRITZ, SAMUEL (1656-1728). A German Jesuit missionary, born in Bohemia. He entered the Jesuit Order in 1673, went to Cartagena in 1684, studied at Quito in 1685, and in 1686 became a missionary on the upper Amazon. Owing to ill health, he withdrew to the Portuguese colony of Para, at the mouth of the river, and was held prisoner as a spy there until 1691 by the Governor. Having been liberated and having reported to the Viceroy at Lima his various observations, he returned to his missionary field in 1693. During his 42 years of activity among the Indians he founded the Omaguas missions and others and prepared the material for his great map of the Amazon. This appeared at

Quito in 1707, in the *Lettres édifiantes* (vol. xii) in 1717, and was for many years the recognized authority on the region included by the river system. The Jesuits call him "the Apostle to the Omaguas"

FRITZ, UNSER (Ger., Our Fritz) A name given by the Germans to Frederick William, Crown Prince of Prussia, later Emperor Frederick III

FRITZLAR, FRITS'lar, HERBERT and HERMANN VON See HERBERT and HERMANN VON FRITZLAR
FRITZNER, FRITS'nēr, JOHAN (1812-93) A Norwegian lexicographer, born at Asko, near Bergen. He was educated at Christiania and after holding several pastorates devoted himself entirely to scientific labors, as a result of which he published the *Ordbog over det gamle norske Sprog* (1861-67, 2d ed., 1883-96), an excellent dictionary of ancient Norse

FRITZSCHE, FRIT'she, ADOLF THEODOR HERMANN (1818-78) A German classical scholar. He was born at Grotzsch, Saxony, and was educated at Leipzig, where, after an activity of several years at the University of Gießen, he occupied the chair of philology from 1850 until his death. Besides original poems in Latin and German, he published valuable editions of several works of the Greek and Roman classics, the most noteworthy being the elaborate edition of *Theocritus* (2d ed., 1869) and that of the *Satires* of Horace (1875-76)

FRITZSCHE, FRANZ VOLKMAR (1806-87) A German classical scholar, son of the theologian Christian Friedrich Fritzschke (1770-1850). He was born at Steinbach in Saxony and, after studying under Beck and Hermann at the University of Leipzig, was professor of eloquence and poetry at Rostock from 1828 until his death. His works deal chiefly with Lucian and the Greek dramatists, particularly Aristophanes. Among the most important are the *Questiones Lucianæ* (1826), an edition of the *Dialogi Deorum* of Lucian (1829), an edition of Aristophanes' *Thesmophoriazuse* (with a commentary, 1838) and *Ranæ* (1845), and a critical edition of Lucian's complete works (1860-74). In defense of his old teacher, Hermann, he published *Recension des Buches Æschylos Eumeniden von K. O. Müller* (1834)

FRITZSCHE, KARL FRIEDRICH AUGUST (1801-46) A German theologian, the elder brother of Franz Volkmar Fritzschke. He studied under his father and subsequently attended the University of Leipzig. After holding a professorship at that institution for one year he was successively professor of theology at Rostock (1826-41) and Gießen (1841-46). His philological interpretations of biblical texts are accurate, and in the defense of his views he was a skillful controversialist. His principal works are the commentaries on *Matthew* (1826), *Mark* (1830), and the *Epistle to the Romans* (1836-43)

FRITZSCHE, OTTO FRIDOLIN (1812-96) A German theologian, brother of F. V. and K. F. A. Fritzschke, born at Dobrilugk, southwest of Frankfurt, he studied at Halle, became professor extraordinary at Zurich (1837), full professor (1842), and also chief librarian at the cantonal library in 1844. He published a critical edition of Lactantius (1842-44), *The Life and Writings of Theodore of Mopsuestia* (1836) and his *Exegetical Fragments* (1847), Anselm's *Cur Deus Homo?* (1868), and other works. He is best known by his work on the Old Testa-

ment *Apocrypha and Pseudepigrapha* (6 vols, 1851-60)

FRIULI, fr̥-oolé The name of a district on the north and northeast shores of the Adriatic Sea now forming the Province of Udine, Italy, and the Austrian coast districts of Gorz and Gradiska (Map Italy, D 1) Friuli was anciently one of the 36 duchies into which the Longobards divided the north of Italy. It derived its name from that of its chief town, Forum Julii, which was said to have been founded by Julius Cæsar. This town is now known as Cividale del Friuli. Another important town in the district was Aquileia. The district was from an early period divided into Tyrolese and Venetian Friuli, the former of which came into the possession of Austria in 1500, while the latter remained attached to Venice till the Peace of Campo-Formio (1797), when it also was given to Austria. Venetian Friuli finally came into the possession of Italy in 1866. The area of the district is about 3300 square miles, its population, about 700,000. The inhabitants, called Furlani, are for the most part Italian, but speak a peculiar dialect, with many words of Celtic extraction. Consult Manzano, *Annali del Friuli* (Udine, 1858-79), and Fracassetti, *La Statistica etnografica del Friuli* (ib, 1903). See UDINE.

FRIULI, DUKE OF See DUROC, GÉRARD CHRISTOPHE MICHEL.

FRIZ'ZLE A breed of fowls, so called from the strangely curled ends of the feathers, especially those of the neck and back. They are bred largely for their grotesque appearance, but are hardy and useful.

FROBEL, fr̥'bel, FRIEDRICH WILHELM AUGUST (1782-1852). A German educationalist, the famous promoter of what is known as the kindergarten movement. He was born at Oberweissbach in Thuringia, April 21, 1782, where his father was a pastor of the old Lutheran church. As his mother died while her son was an infant, the boyhood of the future friend of children was lonely, and his father's second marriage did not increase the happiness of the child. He became strongly introspective, and the severity of the religious influences under which he was trained placed him in a morbid attitude towards life, both the present and the future—a disposition which he overcame in his majority. At the age of 10 years he was sent to his uncle in the town of Ilm, where a happier life began. When 15, he was apprenticed to a forester, and his duties were such that, while he added to his knowledge of the outer world, he could devote himself (as he says) "in many various ways to self-education, self-instruction, and moral advancement. Especially did I love to indulge my old habit of self-observation and introspection."

In 1799, when the days of his apprenticeship were over, he went to Jena and for several months came under the influence of the university, where his brother had been enrolled as a student of medicine. His studies were irregular and unfruitful, and at length, after confinement for several weeks in the "carcer," because he had not money to pay his bills, he withdrew from the university and secured employment in the Office of Woods and Forests in the Territory of Bamberg. He was then brought again into close companionship with nature, for his calling required him to live out of doors in a region of lovely scenery. After a short service of this kind he was engaged as a surveyor in the service

of the Bavarian government, and later he became manager of a private estate. Having inherited a little property at the death of an uncle, he determined to become an architect and for this purpose went to Frankfurt on the Main. Gruner, the master of the Frankfort Model School, then said to him "Give up architecture. It is not your vocation at all. Become a teacher. We want a teacher in our own school. Say you will agree, and the place shall be yours." The young man accepted, and thus began his educational career. Gruner had been a pupil of Pestalozzi, whose name was the watchword of the Frankfort school. "It soon became evident to me," says Frobel, "that Pestalozzi was to be also the watchword of my life." So Frobel went to Yveidon and remained for a fortnight on a visit to the great educational reformer, whom he greatly admired, but whose methods he did not wholly approve. Uncertainty as to his calling—due perhaps to fickleness, perhaps to versatility, perhaps to genius—still embarrassed him. Several openings came to him, but none attracted him. So he returned to Pestalozzi and remained many months at Yverdon, where he wrote out an account of the work there in progress. His career continued uncertain, and he tried once more the environment of university life—first at Gottingen, and then at Berlin, where he showed such proficiency in mineralogy that his professor, Dr. Weiss, gave him an assistant's post in the mineralogical museum. War interrupted this service. In 1813 he joined Lutzow's famous troop and saw some active service, and again in 1815 he enlisted as a volunteer. At the close of the war he determined to devote himself to the promotion of education. A curious passage in his autobiography declares that in the mineralogical laboratory "the stones in my hand turn to living, speaking forms. The crystal world, in symbolic fashion, bore unimpeachable witness to me, through its brilliant unvarying shapes, of life and of the laws of human life, and spoke to me with silent yet true and readable speech of the real life of the world of mankind."

His approaching marriage (in 1818) may have had some influence in concentrating his mind upon the purpose of life, for he founded in 1816 a school at Griesheim (afterward removed to Keilhau), called "the Universal German Educational Institute," and in it he proceeded to develop his plans. Up to this time all the events of his life had been preparatory. He was now 36 years old, his life half gone. During the next 34 years his work was accomplished.

Eight years later he published his most important book, a volume entitled *Menschen-erziehung* (Education of Man), which is a sort of corner stone in his philosophy of education. Notwithstanding its comprehensive title, it really discusses the education of a child. The Institute awakened suspicion, and finally opposition, on the part of conservative governments, and the Prince of Schwarzburg-Rudolstadt caused an official inspection of it to be made. The report, on the whole, was favorable. Frobel's attention was now called by Krause (a well-known philosopher, whose acquaintance he had made) to the writings of Comenius, and from them he received a fresh impulse towards the development of his educational plans. After unsuccessful attempts to establish his Institute at Helba, near Meiningen, and afterward near Lucerne, at Willisau, the Bernese government

invited Frobel to consider a plan for founding an orphanage at Burgdorf. To this place he removed in 1835, and success followed the change. It is said that he considered at this time a visit to the United States in order to establish his system in a new country. He was now committed fully to the doctrine that the education of the nursery must be reformed, and the need of training for mothers became more and more evident to him. After a short stay in Switzerland he went to Berlin in 1836, returned to Keilhau, and then established himself in Blankenburg, a small town not far from Keilhau. Langelhal, Middendorf, and Barop were his serviceable assistants. About this time he hit upon the name "kindergarten," which has since been introduced into many lands and many tongues—a much better term than one originally employed by Frobel—"Anstalt für Kleinkinderpflege" (an institution for the care of little children). His friend Barop tells this story: "Middendorf and I were one day walking to Blankenburg with him over the Steiger Pass. He kept on repeating, 'Oh, if I could only think of a good name for my youngest boy!'" Blankenburg lay at our feet, and he walked moodily towards it. Suddenly he stood still as if riveted to the spot, and his eyes grew wonderfully bright. Then he shouted to the mountain so that it echoed to the four winds, 'Eureka!' Kindergarten shall the institute be called."

Embarrassments still beset him. His ideas were not generally accepted, he lacked money for the maintenance of his school, his publications were not remunerative, more than this, his nephew, Carl Frobel, a professor at Zurich, became the loud advocate of measures which were radical, if not revolutionary, and Frederick Frobel was accredited with his nephew's opinions. In 1851 Von Raumer, Minister of Education and Public Worship, forbade the foundation of kindergartens in Prussia, and the edict remained in force until 1860, long after Frobel's death. After 1850 Frobel made his home in Marienthal, where the Grand Duke of Weimar gave him the use of a country seat. Here he was aided in his school by Luise Levin, who in 1851 became his second wife, and by Alwine Middendorf, who married Dr W Lange, the future editor of his writings. His death occurred June 21, 1852. The school at Marienthal was then removed again to Keilhau.

Frobel's literary style was not good, and his works were never popular, but his thoughts arrested the attention of able and influential people, and by these interpreters and followers kindergarten methods have been introduced into many countries. "Let childhood ripen the children," says H C Bowen, "is the keynote of the new gospel." "It is what he did for the education of children between the ages of three and seven that chiefly demands our gratitude." As a statement of his principles, the summary given by H C Bowen is adequate. "The main principles, it will be remembered, whose applications form Frobel's system, are self-activity, to produce development, all-sided connectedness and unbroken continuity, to help the right acquisition of knowledge, creativeness or expressive activity, to produce assimilation of knowledge, growth or power, and acquisition of skill, well-ordered physical activity, to develop the physical body and its powers, and happy and harmonious surroundings, to foster and help all these."

(*Frobel and Education by Self Activity*, pp. 180, 181.)

The principal writings of Frobel have been collected in three volumes by W Lange (Berlin, 1862) and by Friedrich Seidel (Vienna, 1883). Among them the most important is the *Education of Man*, which appeared in 1826. It has been translated into French and into English. The *Mutter- und Kose-Lieder* (Mother's Songs, Games, and Stories) has had many translators. The autobiographies were translated by H K Moore and Emilie Michaelis, and in part also by Miss Lucy Wheelock (new ed, London, 1899).

In addition to his own writings, materials pertaining to the life and influence of Frobel are abundant and are enumerated in bibliographies that are readily accessible. A selection is not easy. Dr Barnard's collection of *Papers on Frobel's Kindergarten* (Hartford, 1881) is comprehensive and important. There are two English translations of *The Education of Man*—one by Miss Josephine Jarvis (New York, 1885) and the other by W N Hailman (ib, 1887). The *Mother Play* (2 vols, ib, 1895) was translated by Miss Susan E Blow, who has also written a book on *Symbolic Education* (ib, 1894), a commentary on the first five songs of the *Mother Play*, and a volume entitled *Letters to a Mother* (ib, 1900).

Among the estimates of Frobel's work these citations may be made. Henry Barnard declared the kindergarten to be by far the most original, attractive, and philosophical form of infant development the world has yet seen. Dr James Ward holds that the kindergarten system, in the hands of one who understands it, produces admirable results, but is apt to be too mechanical and formal. F W Parker says that the kindergarten is the most important, far-reaching educational reform of the nineteenth century. M Quick in his *Educational Reformers* (New York, 1896), from which these words are taken, concludes his estimate by saying that among those who have contributed to the science of education there are probably no greater names than those of Pestalozzi and Frobel. The memoir by H Courthope Bowen in the *Great Educators Series*, ed by Nicholas Murray Butler (New York, 1897), is an admirable study of Frobel's principles. The fullest biography is that by A B Hanschmann (Eisenach, 1874). A short mention was written by Miss Emily Shirreff (London, 1887). Of the last four years of Frobel's life there are delightful reminiscences by an accomplished enthusiast, the Baroness von Marenholtz-Bulow (trans by Mrs Horace Mann, Boston, 1887). Two autobiographical fragments (a letter to the Duke of Meiningen and a letter to the philosopher Krause), which narrate the perplexities and obstacles of his early life, are contained in a volume entitled *Autobiography of Frobel* (Syracuse, 1889). It also includes a convenient bibliography. Consult also Fletcher and Welton, *Frobel's Chief Writings on Education Rendered into English* (New York, 1912). See KINDERGARTEN, PEDAGOGY, CHILD PSYCHOLOGY.

FROBEL, JULIUS (1805-93). A German writer and politician, nephew of Friedrich Frobel. After studying at Munich, Weimar, and Berlin, he went to Switzerland, and in 1833 became professor of mineralogy in the industrial and high schools of Zurich. In the interests of the extreme Radical party he edited *Der Schweizerische Republikaner*. In 1844 he gave up his

professorship and established a publishing house at Zurich and issued several scientific works and many political pamphlets. Some of his works were suppressed by the government. In 1846 he took up his residence in Dresden until the revolution of 1848, when he became a leader of the Democrats and a member of the National Assembly at Frankfort-on-the-Main. He accompanied Robert Blum to Vienna and was arrested and sentenced to death, but was pardoned by Windischgratz on account of his brilliant mind. After the dissolution of the Parliament he came to the United States (1849), edited a German paper in New York, went in 1850 to Nicaragua, and afterward engaged in one or two commercial expeditions to Santa Fe and Chihuahua. In 1855 he edited a journal in San Francisco and in 1857 returned to Germany. From 1862 to 1873 he edited newspapers in Vienna and Munich. He was German Consul at Smyrna from 1873 to 1876 and at Algiers from 1876 to 1889. He retired from active life in 1890. His works include *Aus Amerika* (1857-58), translated by himself in 1859 under the title of *Seven Years' Travel in Central America, Northern Mexico, and the Far West*, *Die Wirtschaft des Menschengeschlechts* (1870-76), *Ein Lebenslauf* (1890-91), his autobiography.

FROBEN, frō'bēn, or **FROBE'NIUS**, JOHANNES (c1460-1527). A German scholar and printer. He was born at Hammelburg, was educated at the University of Basel, and established in Basel, in 1491, a printing press, at which the art of printing was first brought to a high degree of excellence in Germany. An intimate friend of Erasmus, he printed his writings and had his help in editions of St Jerome, St Cyprian, Tertullian, Hilary of Poitiers, and St Ambrose. Luther used Froben's Greek Testament of 1516, edited by Erasmus, for his translation. Holbein illuminated texts for Froben. Froben did not live to carry out his project of editing the Greek Fathers, but it was done by his son Jerome and his son-in-law, Nikolaus Episcopius. See ERASMUS.

FROBERGER, frō'bēr-gēr, JOHANN JAKOB (c1605-67). A German organist, born probably at Halle. When very young, he entered the Imperial choir in Vienna, in 1637 was court organist there, and the same year went to Rome to study under Frescobaldi. He was again court organist (1641-45 and 1653-57) in Vienna, and then made a series of concert tours, appearing with great success in London and Paris. Froberger is a most important figure in the history of organ music, combining German power of expression with Italian nicety of form. He died at Héricourt, France. Consult F. Becker, *J. J. Froberger* (Leipzig, 1884).

FROBISHER, frōb'ish-ēr, SIR MARTIN (1535-94). An English navigator and the first of his nation to seek a northwest passage to China. He was born either at Doncaster or Altofts in Yorkshire and belonged to a family which came originally from Wales. His early years were spent in voyages to the coast of North Africa and to the Levant. In 1575, at the instigation of Elizabeth, he received a license from the Muscovy Company to search for the Northwest Passage. With two vessels (the *Gabriel* of 25 tons and the *Michael* of 20 tons) and a pinnace of 10 tons, he sailed north in 1576 and sighted the southern point of Greenland, which he took to be the Friesland of the brothers Zem. Here a storm occurred in which the pinnace was

lost and the *Michael* deserted. But with the *Gabriel* Frobisher came a few days later to a cape he named Queen Elizabeth's Foreland, near the southeast end of Frobisher Bay, which he supposed to be a strait. After a fortnight's exploration of the coasts and islands he returned to England, bringing with him some "black earth" from which originated a rumor of the discovery of gold. The prospect of unlimited wealth aroused the attention of the merchant adventurers of the time. A second expedition, better equipped than the first, was fitted out, and the command was given to Frobisher. He sailed in May, 1577, but his activity was chiefly confined to hunting for gold, and his discoveries, which were comparatively trifling, were restricted to the locality which he had previously visited. A third expedition, with 15 ships, was sent out in the year following, with no other result than the discovery of a new strait, which was not explored until the time of Henry Hudson. Frobisher afterward served under Drake in the West Indies and was knighted for distinguished service in the fight with the Spanish Armada (1588). In the spring of 1591 he was sent by Sir Walter Raleigh with a squadron to ravage the Spanish coast and hold the attention of the Spanish fleet while efforts were made to intercept the merchant vessels laden with bullion on their way from Panama. He died in November, 1594, from the effects of a wound received while leading an attack by sea against Brest, then in the hands of the Spaniards. The narrative of Frobisher's three voyages may be found in the Hakluyt Society Publications for 1867. For an account of his life, consult Jones (London, 1878).

FROBISHER BAY. An inlet of Davis Strait, in North America, opening westward between Hudson Strait and Cumberland Sound, into the territory called the Frobisher Meta Incognita, at the south end of Baffin Land (Map, North America, M 3). It is about 200 miles long and above 20 wide, with rugged mountainous shores. It was till Hall's voyage called Frobisher Strait, being erroneously regarded as a passage into Hudson Bay.

FROG (AS. *frogga*, Icel *froskr*, OHG *frosco*, Ger *Frosch*, ultimately connected with OHG

TYPES OF SHOULDER GIRDLE

1, 2, Acroterous (*Bombinator* and *Bufo*), 3-7, Firmisternal types (3, adult *Rana*, 4, young *Rana*, showing change from acroterous to firmisternal type with advancing age, 5, *Hymysus*, 6, *Breviceps*, 7, *Cacopus*). Cartilaginous parts are dotted, ossified parts are left white. Lettering: cl, clavicle, co, coracoid, e, epicoracoidal cartilage, h, humerus; m, metasternum, o, omosternum, p, precoracoid, sc, scapula, ss, suprascapula.

frō, Ger *froh*, joyous, Skt *pru*, to jump). Any member of the Ranidae, a family of tailless Amphibia, of the group Firmisternia (qv), i.e., the two halves of the shoulder girdle meet and

are firmly united in the median ventral line, so that the chest cannot be expanded, and in this family, as distinctive from other Firmisternia, the sacral diapophyses are cylindrical. The young, known as "tadpoles," live in the water, have fringelike external gills, which disappear while they are still young, are without legs, and have a tail provided with a membranous swimming fin.

The family Ranidæ is divided into three subfamilies, according to the arrangement of the teeth. 1. *Ceratobatrachinæ*, with teeth in both jaws. This is represented alone by the great horned, tree-climbing frog (*Ceratobatrachus guentheri*) of the Solomon Islands, which is remarkable chiefly for its extraordinary adaptation in color and appearance generally to its customary surroundings, giving it entire concealment from ordinary observation. 2. *Raninæ*, with teeth (vomerine) in the upper but none in the lower jaws. This is the group of true frogs, regarded as a family by most authors previous to 1901, and typified by the genus *Rana*, which contains about 140 species. 3. *Dendrobatinæ*, an aberrant group of South American and African frogs, with no teeth at all. They are small and usually brightly colored and take remarkable care of their young, the mother allowing the tadpoles to fasten themselves by a secretion to her back when their native puddle dries and thus carrying them to a safer place. One Brazilian species (*Dendrobates tinctorius*) furnishes from its skin the poisonous secretion used by bird fanciers to change the color of the plumage of the Amazon green parrots.

There are about 270 species of Ranidæ, which are distributed over nearly all parts of the world except Australia, but there are very few species in South America and these only in the northern part.

FROG CARRYING TADPOLES

In the United States the family is well represented by 13 species of the genus *Rana*. Of these the bullfrog (*Rana catesbeiana*), so named on account of its bellowing note, is perhaps our most widely known, as it is our most characteristic frog. It is very large, attaining a length of 8 inches, loves the shore, and is green, with olive and dusky blotches (See BULLFROG). It is equal in size only by an East Indian species (*Rana tigrina*) and by one in the Solomon Islands (*Rana guppyi*). The leopard frog (q v), or shad frog (*Rana virescens*), is green or often brassy-colored, with two rows of black, white-edged blotches on the back. It is the commonest North American *Rana*. The wood frog (*Rana sylvatica*) is small and reddish brown, with a dark band on each side of the head, it is the most silent frog of the genus, and avoids water except at the breeding season, and its brown color well conceals it among the fallen forest leaves. The green spring frog (q v) (*Rana clamata*) inhabits cold springs. It is brown or green above and white below and may be readily distinguished by the very large eardrums. Like most aquatic animals, frogs can change slightly the color of the skin, according to external conditions. Two species of *Rana* are common in Europe, viz., *Rana esculenta* and *Rana temporaria*. The latter alone is indigenous

to Great Britain, and varieties of it extend throughout temperate Europe and Asia to Japan, and one (variety *pretiosa*) exists in the western United States. The edible frog (*Rana esculenta*), however, has been introduced into England. An Indian species (*Rana brevicaps*) and several South African species burrow in the ground.

Besides the true frogs, several other families, such as the spadefoots (Pelobatidæ), the tree frogs (Hylidæ), and the piping frogs (Hylodidæ), are often so called. These show structural affinities which bring them as near to the toads as to the frogs, and are described elsewhere under their separate names.

Ecology and Habits. The skin of frogs is usually smooth and free from warts or horny excrescences. It is invested with a colorless epidermis, which is shed from time to time as the creature grows, this splits along the back and thighs, is worked over the head like the taking off of a shirt, and is usually eaten by the wearer. The deeper layers contain much pigment, in cells which are more or less under muscular control, enabling frogs to change their hue to conform to the background. (For further information on this point, see METACHROISIS, TREE FROG.) The skin also secretes in numerous glands a viscid milky fluid, which is of poisonous character—in some species very decided—and is their only defensive property. That obtained from a South American frog is said to be used as an arrow poison by the Amazonian Indians. In a rare East Indian form, the arboreal flying frog (q v), the skin spreads into broad webs between the greatly extended toes, enabling the animal to make long sailing leaps, analogous to those of the flying squirrel. All frogs move on land by leaps, which are often of surprising vigor and extent.

Frogs are carnivorous and in the season of activity are likely to be very voracious. The terrestrial and arboreal forms feed mainly on insects, worms, etc. The aquatic kinds also catch insects, but subsist more on aquatic animals—worms, tadpoles, small fishes, and other frogs. These are seized and slowly swallowed—often, where the prey is large, so slowly that the engulfed parts will be digested before the remainder, perhaps still alive, has been got within the mouth.

Extremes of cold or drought in climate must be avoided by frogs. Moisture of the skin is necessary to their health, and in very dry places or seasons they survive only by going deeply underground. Thus some tropical species get through the "dry season." The frogs of northern climates endure the winter by clustering about spring holes and other places where the water is comparatively warm and free of ice, or else by hibernating in the mud. Terrestrial species bury themselves for the winter in the loam, or burrow into the dry dust of rotting logs and stumps. Their vitality is strong, and their power of regeneration from partial congelation is very great.

Though most species live always in or near water, many spend the greater part of their time away from it and often in bushes or trees. These, however, go to the water to breed, and as this function is likely to demand attention early in the spring, it is then that these animals make themselves most conspicuous by the incessantly uttered croaking or rattling calls of the males, which are almost as varied as the songs of the birds and more ventriloquistic. These are

wholly the cries of the male frogs and cease when the mates have been found and have spawned, and to assist in producing them many species have gular air sacs, which are connected with the vocal organs and furnish the power required for the loud and insistent utterances. The great eardrums correlated with this vocal power are conspicuous in many species.

The reproductive habits of frogs are various. All of our common species lay their eggs in

ACTION OF FROG'S TONGUE IN CATCHING A FLY

water, the eggs being fertilized as they are laid. As the eggs are laid, they are inclosed in a gelatinous envelope secreted by the female. This swells and protects the eggs from injury, from being fed upon, from the direct rays of the sun, and in some species it serves to float the eggs at the surface of the water, where oxygen is most abundant, finally, the envelope serves as food for the young frog. The mouth of the tadpole is small and provided with a horny beak, which takes the place of the teeth which are not yet developed. The tadpole feeds on algae that cover stones and on the flesh of dead animals. The long, spirally coiled intestine, which can be seen on the underside of the animal, is an adaptation to its prevalently herbivorous diet, which requires a prolonged digestion.

The tadpole usually lives in the water for two or three months before it takes to land. In the bullfrog, however, the transformation (see TOAD) does not take place until the second summer.
